The 51st Annual Conference of the Association for Consumer Research (ACR) was held October 1-4, 2020 NOT in Paris, France, as originally planned, but virtually, using several platforms available to the ACR Community. This conference marked ACR's 1st-ever virtual conference, and continued the community's tradition of welcoming interdisciplinary, cross-method, international scholars sharing knowledge of consumer behavior.

Our conference theme was "Rendez-Vous in the City of Light." This theme was inspired in part by the fact that Paris, The City of Light, is known as a place embracing the values of Enlightenment, the age of reason, deep thinking, and rational thought. Together with the term "rendez-vous" which translates to "appointment" in English, our hope was that ACR 2020 would be an opportunity for scholars with different methodological approaches, paradigm perspectives, and research interests to come together to focus on consumer research related questions. Then COVID-19 hit, derailing our original plan to rendezvous in Paris; instead, the rendezvous transpired online via a conference platform and Zoom. Despite the change in venue and a move from the traditional conference approach with which we are all familiar, we believe that perhaps our theme was BETTER suited for a virtual conference. Enlightenment was achieved through the Fellows' Addresses (by David Mick and Marsha Richins), the Presidential Address (by Eileen Fischer), a pre-conference on Diversity, Equality & Inclusion, the Sheth doctoral consortium, early career workshops, the Film Festival, Knowledge Forums, competitive paper presentations, special sessions, and working paper posters. The ability to offer customizable agendas and access to all of the conference material weeks beyond the conference dates further facilitated thinking and sharing ideas. Breakout rooms in Zoom were widely used to rendezvous during Knowledge Forums and entertaining receptions spanning the globe.

The conference attracted over 1,700 participants from 41 different countries. We received 1,422 total submissions and accepted 759, which represents a 53% acceptance rate. This year's conference presented 329 competitive papers (45% acceptance rate), 65 Special Sessions (65% acceptance rate), 343 working papers (62% acceptance rate), 11 Knowledge Forums (43% acceptance rate) and 13 films (76% acceptance rate). We thank our generous sponsors: The Sheth Foundation, the Society for Consumer Psychology, the Journal of Consumer Research, and the University of Chicago Press.

So many incredible members of the ACR Community helped us make this novel conference format a success. We especially wish to thank Melissa Archpru Akaka, Joey Hoegg, and Sonia Monga (Working Paper co-chairs), Caleb Warren and Michelle Weinberger (Knowledge Forum co-chairs), Joonas Roka and Ekant Veer (Film Festival co-chairs), Brent McFerran and Karen Winterich (Early Career Workshop co-chairs), Lisa Cavanaugh and Andrea Morales (Sheth doctoral consortium co-chairs), and Raji Srinivasan and Carolyn Yoon (DEI pre-conference co-chairs). Thanks to Marie Taillard for her willingness to serve as our Special Local Arrangements Co-Chair (we, together with Marie, had selected an incredible venue for our Saturday gala in Paris, alas…). Many thanks go to our excellent Associate Editors: Simona Botti, Susan Broniarczyk, Robin Canniford, June Cotte, Kristina Durante, Colleen Harneling, Yuwei Jiang, Sarah Moore, Al Muniz, Joe Nunes, Hilke Plassman, Derek Rucker, Cristel Russell, Daiane Scaraboto, Jaideep Sengupta, Bram van den Bergh, Ela Veresiu, Henry Weijo, and Kate White. We thank our Program Committee, Competitive Paper Reviewers, and Working Paper Reviewers. Finally, thank you to our reception hosts for providing attendees a much needed opportunity to socialize with others while having some fun: Simona Botti, Giana Eckhardt, Stefano Puntoni, and Martin Schreier (Europe); Darren Dahl, Rich Lutz, and Linda Price (North/South America); Christina Anthony, Robin Canniford, Elizabeth Cowley, and Anirban Mukhopadhyay (Asia/Pacific).

Special gratitude goes to ACR Executive Director Rajiv Vaidyanathan, our Conference Planner Paula Rigling, the ACR Executive Assistant Brenda Monahan, and our graphics designer Roy Wiemann.

Finally, an extra special thanks to Eileen Fischer, ACR President 2020, for honoring and entrusting us with the responsibility of organizing ACR 2020, and for her undying enthusiasm, flexibility, and incredible support. It has been a long, strange journey, but a wonderful one for the three of us working with such amazing people from the ACR community! Thank you.

Jen Argo, University of Alberta, Canada
Tina M. Lowrey, HEC Paris, France
Hope Schau, University of Arizona, USA

2020 Conference Co-Chairs

Conference Committees & Reviewers

PRESIDENT

Eileen Fischer, York University, Canada

CONFERENCE CHAIRS

Jennifer Argo, University of Alberta, Canada
Tina M. Lowrey, HEC Paris, France
Hope Jensen Schau, University of Arizona, USA

ASSOCIATE EDITORS

Simona Botti, London Business School, UK
Susan Broniarczyk, University of Texas at Austin, USA
Robin Canniford, University of Melbourne, Australia
June Cotte, Ivey Business School, Canada
Kristina Durante, Rutgers University, USA
Bikram P Ghosh, University of Arizona, USA

2020 ACR Presidential Address

Where To From Here?

Eileen Fischer, Professor of Marketing and
Anne and Max Tanenbaum Chair of Entrepreneurship and Family Enterprise, Canada

It seems fair to say that 2020 has been an "unprecedented year." Indeed, the term "unprecedented" has become so common that many people are whishing we could go back to living in some "precedented" times for a while. But there is no going backward. Our only choice ever is to go forward. So my address will take up the question "where to from here?"

Before getting to that, of course, I need to acknowledge what has made 2020 so unprecedented. How do I sum up this year in a few sentences? Of course, I can't. But to state the obvious, I want to acknowledge the seismic changes that have been wrought to the lives of everyone on the planet by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and the disease it causes, COVID-19. Equally, I want to acknowledge the heightened salience of racism in general, and systemic anti-black racism in particular, in the wake of the protests following the death of George Floyd in May of this year, fast on the heals of the deaths of Ahmaud Arbery in Feburary and Breonna Taylor in March, not to mention the nearly countless others who have died owing to systemic racism in the years before this.

Perhaps most salient, in my own mind at least, is how deeply interconnected these twin pillars of 2020 are proving to be. It is impossible to ignore that the pandemic has disproportionately affected people from Black, Asian, Indigenous and minority ethnic communities. The acute plague that is COVID-19 is making it impossible *not* to pay attention to the chronic systemic racism in our societies, and to the sprawling consequences thereof. Let me summarily, then, refer to both the pandemic and every more visible prominence of systemic racism as the "tumult" that has surfaced in 2020, but that surely will continue to be a factor in all our lives as citizens and as scholars in the years ahead.

What I want to reflect on is how some learning can come from reflecting on this year that will give us some guidance, or guardrails, or even dare I say inspiration about where we go from here. I organized about this under two distinct headings. The first is: where we go from here as the academic association that is ACR? The second is: where we go from here as consumer researchers?

My read of prior presidential addresses suggests to me that most ACR presidents have talked about consumer research for the most part, not about the Association for Consumer Research itself. But this year, it seems at least as important to talk about the how ACR can and should respond to the events of 2020, so that's where I'll start.

First I want to review some the steps that ACR has taken thus far. The Board of ACR has we've tried to be responsive on a number of fronts, starting with but not limited to making a statement regarding ACR's stand against racism. It reads as follows:

ACR rejects racism, hate, intolerance, oppression, and discrimination in all its forms.

Our diverse, global membership includes scholars from populations who face threats to their human rights, including threats to their lives. To these members, we say: We see you! We hear you! We support you! You are not alone!

We recognize in particular the deep pain, fear, anger, and frustration that our members who are part of the Black community have experienced, and continue to experience, as a result of anti-Black racism directed toward them.

Although events in the U.S. are finally receiving heightened attention, racism, hate, intolerance, oppression, and discrimination are widespread, and systemic racism is pervasive and pernicious in societies around the world.

As scholars, as citizens, and most fundamentally as humans, we have a shared responsibility to speak out and act against racism and injustice and to uphold and promote the values of respect, equity, diversity, and inclusion. We know it is not enough to simply condemn anti-Black racism, or the systemic suppression of human rights in general. More must be done. It is also time to prioritize scholarship that can be conducive to better understanding and helping to alleviate, systemic racism, and the conditions of oppression.

And while this statement is an important one, what needs to be underscored is that systemic racism isn't just happening "out there." Its effects are also evident "in here" by which I mean inside ACR. This is reflected, for example, in the under-representation of many categories of scholars within our ranks.

Recognizing this fact, the ACR board has tried to find an immediate way of taking concrete action, Working with The PhD project has proven to be a great starting point. For those of you I'll just highlight some of its goals, which include:

- To inform and educate minorities about all aspects of a business doctoral program, and encourage them to follow their dream of becoming a professor; and
- To provide a nurturing support network for minorities as they navigate their doctoral program;

By a decision of the ACR Board of Directors, we have entered a partnership with the PhD Project that has already seen us offer financial support in various forms. As well, we're working with them, and with Marketing Ethnic Faculty Association, on a customized mentorship program that should launch this year.

Beyond this, ACR has supported and encouraged JACR in publish special issues relevant to both anti-racism and the pandemic. And it's making relevant materials, for example on how to be an ally, available on the ACR website. Moreover, we are seeking the approval of ACR's members to amend our by-laws in order to establish on new position on the board: An Equity, Diversity and Inclusion Champion who will help oversee more initiatives.

These steps, while worthwhile, stop short of what the association needs to do, at least in my view. It's great that we've found a way to connect with PhD students who are fortunate enough to be members of the PhD project, but the PhD project is only open to students who are American citizens and who are members of particular racial groups. We need to find ways of lowering the barriers to entry for others who are not eligible for membership in the PhD project but who are subject to systemic racism or other forms of marginalization And merely lowering barriers to entry won't be adequate, if members of marginalized groups don't feel like they can participate fully in ACR, including participating in the conferences inside and outside

North America, and participating in the leadership of ACR. It's easy to call for inclusivity, but a lot harder to achieve it, and tailored approaches are definitely required especially given that barriers to full participation in ACR are quite different from region to region.

For the Association to change for the better, it will require engagement far beyond the elected members of the Board. And there are many ways that people can get involved. For example, members of ACR can

- Bring ideas about marginalized groups that may be being overlooked to the attention of the board of ACR.
- Work with other ACR members to identify concrete initiatives that will help members of specific groups who are under-represented or marginalized in our association
- If asked to help out with an initiative, make the time to do so
- Seek greater education about systemic racism and about how to be an ally

And this list is by no means exhaustive.

To be clear, I'm not trying to say that everyone has the capacity to pitch in and help right now. I know many members of ACR are busy just trying to deal with the immediate challenges in front of them. This isn't meant to make anyone feel an extra burden at a difficult time.

It is, however, meant to be an invitation to those who are concerned to step forward.

Having discussed what I see as the way forward in terms of the Association, Ill turn my attention to some thoughts about the way forward for our research. And I'm mindful that some of what I'm going to suggest may sound a bit strangely sociological to those who come from a more purely psychological research tradition. But I believe the three suggestions I'm going to make benefit a lot of people grappling to make their work meaningful in light of issues that have surfaced in 2020.

So what issues HAVE surfaced in 2020 that weren't necessarily top of mind before?

To me, the compelling issues relate to the uneven effects of the pandemic on consumers in different sociological categories. And to address this, I have three suggestions for researchers, which are: to take intersectionality into account; to carefully attend to context; and to consider consumers as enterprising entities. I'll elaborate briefly on each.

Accounting for Intersectionality. Intersectionality refers to the fact that each and every person is positioned in society at the intersection of multiple social axes, such as race, class, and gender. Theories of intersectionality stress that every person is subject to advantages and disadvantages particular to his or her intersectional position (e.g. Gopaldas & Fischer 2012). My contention is that we probably can't develop meaningful theories that address issues related to the pandemic, to racism, or to both, without taking into account multiple social axes.

For example, any study of how the pandemic has affected women's consumption vs men's cannot generalize across all women; at a minimum race and social class must be accounted for. Consider women at various intersections of race and class deciding whether or not to send their kids back to daycare or school. Women in different race and class axes will not only have different choices in terms of what they can afford, but are likely to face different consideration sets in terms of what they're trying to achieve by sending their kids back to school or not. They're also likely to be subjected to different kinds of normative pressures. Simply put, no generalizations within gender categories should be taken for granted. More broadly, any

study that's going to explore facets of the pandemic needs to take intersections into account.

Carefully Attending to Context. I'm using the term "context "to refer to the "systemic and structuring influences of market and social systems" that consumers are typically not consciously aware of, but that nevertheless affect what they think and what they do (e.g. Askegaard and Linnet 2011). My contention is that we cannot understand situated responses to either the pandemic or institutionalized racism without understanding these systemic and structuring influences

To illustrate this, consider the highly salient case of consumers' decisions involved in whether to wear a mask or what mask to wear. We cannot understand these choices without an understanding the political and social conditions that factor into this choice. And some of those contextual conditions are likely to be deeply rooted in the history and institutional characteristics of the fields to which consumers are habituated. This means that as consumer researchers, we cannot ignore contexts that shape consumers choices, actions and reactions.

Consider Consumers as Enterprising Entities. My last suggestion has to do with how with think about consumers and consumer behaviors. Interestingly, a number of prior ACR presidential addresses have raised questions about the boundaries of the phenomena that are "inside" versus "outside" the set of those we study. My remarks follow in that tradition.

I want to make the case that our investigations of consumers, particularly now, must be broad enough to take into account the enterprising activities that people are engaging in, which are intertwined with and inseparable from those things we more conventionally define as consumption.

This is different than studying consumer "identity work" which is largely symbolic signaling. It's also different than studying co-creation or co-production or adopting a service dominant logic. Both of these are producer-centric views that draw attention to people engaged with a producer whose inputs the consumer responds to. We (also) need a person-centric view that recognizes that people engage in consumption in order to achieve things, and that much of what people buy, access or use is part of a productive process

Now there is no doubt that my perspective on this is shaped by the fact that I actually study entrepreneurial ventures as well as individual consumers. But let me be clear, I'm not asking that anyone else study both. What I am saying is that consumers are frequently engaging in consumption not as an end itself but as means to some end that is agentic, productive, enterprising.

When we arbitrarily draw a line between production and consumption or enterprise and consumption or making and consuming, we do consumers a disservice in terms of characterizing them as passive rather than agentic. Moreover, we de-contextualize their actions, which, hearkening back to my last point, is deeply problematic.

The good news here is that I am seeing increasing tendencies for both qualitative and quantitative scholars to be interested in the yin/yang relationship between what people are doing when they're consuming/producing. However, there is still a tendency for review processes to involve some "policing" of the boundaries of what constitutes consumption and what does not. And I think this is holding us back as field. And particularly given the lessons of 2020, if we're going to do meaningful relevant work that actually serves the interests of the people we study, we need to be broad-minded about the enterprise that is innate in much of what we call consumption.

I'll give JUST one example here to illustrate what I mean. I invite you to consider consumers who are turning to platforms especially now to use them not just for shopping and not just for self-expression but also to try to make money. I want to argue that

this is consumption just as surely as any shopping or online identity building is consumption. These people are consuming platforms like Etsy, Pinterest, Facebook, and Instagram. They are using platforms both to reach and to build audiences, and they are often using platforms to sell products. They are enterprising consumers

Note that we need not uncritically celebrate neo-liberal values when studying consumers as enterprising individuals. But we cannot understand well what they are doing if we think of them as "merely" consuming. And that it's consumption that—particularly now—we should not be ruling outside the boundaries of our field.

I hope that those reading these remarks will give some thought to the innate links between actions that we'd all regard as consuming and those that could be regarded as "enterprising." Even if you don't turn your attention to these actions, be open minded when you review the work of others who choose to do so, because we need research of this kind if our work is going to serve the interests of consumers in 2020 and beyond.

I'll conclude by saying that I feel extremely privileged to have served as President of ACR during this particular year. While it wasn't exactly a pleasure to participate in such decisions as the one to abandon our plans for an in-person gathering in Paris, it has been deeply engaging and educational to work with my fellow board members, and with others in the ACR community, to try to make sense of how our Association should be reshaping itself for the years that lie ahead.

Equally, it has been a privilege to have the virtual podium and reflect on how our research might need to evolve. Obviously, the suggestions that I've made are simply my views on how the lessons of 2020 might shape our research going forward. I hope they are inspiring, but not constraining. In that spirit, regardless of what each of us chooses to do next as 2020 recedes in the rear-view mirror, I hope that as scholars and members of the academy, we will remember to be kind to one other.

2020 ACR Fellows' Addresses

Callings

David Glen Mick, McIntire School of Commerce, University of Virginia, USA

INTRODUCTION

Today I am both delighted and disappointed. Delighted to receive the honor of being named a fellow in our collegial and esteemed Association for Consumer Research. When I began attending ACR conferences in the mid-1980s, I could never have foreseen this day in 2020. I thank you all very much.

But I am also disappointed, because the COVID-19 pandemic has prevented us from convening in person, as originally planned to occur in Paris, the City of Light. Paris is surely one of the most historic, beautiful, romantic, gourmet, and intellectual cities anywhere in the world at any time in the course of human settlement. If you have not yet been to Paris, or if you would like to go again and perhaps stay for a long time, keep in mind what the writer Thomas Gold Appleton once confidently proclaimed. He said that "Good Americans, when they die, go to Paris." Personally, I am equally confident that—regardless of nationality—the same destination is true for all "good consumer researchers" when they pass away.

With Paris and its allure as the backdrop, I want to address today a theme, a yearning, an enigma that we have not before given sufficient attention to. My focus is on Callings. Let me begin by clarifying what I do not mean by Callings. First, I am not pointing to something like a religious conversion or a special leap of religious faith, as when God calls the seeker to a life of spiritual piety. Yet, it is uniquely this sacred kind of Calling that gives the concept its most evocative meanings, even as they apply to something so secular as consumer research. Second, I am not addressing Callings as having to do with vocational choices, such as architecture versus horticulture or education versus business—though it is quite common for people to dedicate themselves to skill development and occupations that reward them greatly. Prior scholarship in management has developed a tripartite model of work orientation that is comprised of jobs, careers, and Callings, in which Callings express our deepest selves in our work (Rosso, Dekas, and Wrzesniewski 2010). For our context today, I will use the notion of Callings as it may apply to specific research projects that you and I conduct, which brings in some factors not as highlighted or as relevant to vocational choices as discussed in the management field.

I will address some central questions about Callings in consumer research, especially what they are, what their value seems to be, and why we should care about them in our professional lives. I want to clarify at the start that not all of our consumer research projects should or could be a Calling. And not everyone who considers my remarks here will have had a research Calling as yet. Moreover, Callings in consumer research can involve either solo or collaborative projects, and they can pertain to a single piece or a stream of manuscripts over a prolonged period. In any case, my principal goal is to excavate the meanings and the implications of consumer research Callings so that together we are better prepared to take advantage of opportunities for research Callings, and to be more fully grateful for those we have already been involved in.

In the course of these comments I will also connect the nature of Callings to two examples from my own work, though not because mine are any more special when compared to anyone else's. They are not. Instead, it is because, in the end, only each of us personally can determine whether any of our own research is a Calling. It is an idiosyncratic, subjective, and private matter. I propose two of my publications as my own Callings in hope that they may offer you some bridges of insights into your own Callings, before-now-or-next.

So, what characterizes consumer research as a Calling? As I enumerate some of the qualities, I will pause momentarily to ask you if a quality that I mention has ever applied to one of your own research projects. Keep also in mind, these qualities I mention need not be all collectively present for a research project to be a Calling. But more is almost always better. In addition, these qualities are like multiple ovals in a Venn diagram, with each quality of a Calling being simultaneously separate, overlapped, and overlapping.

QUALITIES OF RESEARCH CALLINGS

To begin, it is worth asking how the authoritative Oxford English Dictionary (OED) defines a Calling. Naturally, there are many nuances therein, and the religious denotations and connotations of a Calling appear straight-off. Other important meanings of a Calling, for my purposes, include "a meeting," "a requirement of duty," and "the strong impulse to any course of action as the right thing to do."

The strong impulse of a Calling is commonly empowered with passion, but a Calling and a passion are not the same thing. According to the OED, a passion is "an eager outreaching of the mind toward something." Thus, as implied, a passion involves only the individual who has it, originating strictly from within the person's own motives and preferences. In contrast, a Calling—by its grammatical structure and semantic foundation—necessarily implies a second being, a person or entity, that does the beckoning to do the right thing. This beckoning typically comes from something somewhere that many would identify as a "higher authority." In sum, passions are *intra*personal elements that serve to energize and sustain our Callings, whereas Callings involve *extra*-personal elements that draw our attention, direct our priorities, and stimulate our passions.

Moving on now, a Calling is customarily exclusive to each individual, since it often connects to something from one's past, including childhood experiences. My boyhood home had a bookcase, which my mother filled, and invited me to partake of, with volumes of poetry, literature, sociology, and philosophy, even though she herself had never finished high school during the American depression and World War II. I was also raised in the Roman Catholic church at a time when the liturgical language was ancient Latin, where the candles, stained glass windows, and sculptures adorned the walls and alcoves, and where the priests gazed upwards and downwards as they chanted and genuflected. I have wondered how my consumer research, including any of its Callings, has been a manifestation of my upbringing. So, I ask you, have any of your research projects as Callings actually begun when you were still quite young? How so? Callings in research are a lot about who you were already becoming a long time ago.

At its core, a research Calling is also a destiny we have with respect to the given project. It is as if the project has found us, rather than the other way around. And that destiny is something that only we can accomplish in our own manner. Our destiny in that research project is a rich encounter with synchronicity, i.e., we are inevitably

the precise person (or team) for the precise issue at the precise time. And the syncronicity does not just feel timely; paradoxically, it feels equally urgent and timeless. This may sound rather abstract or even pompous at this moment. But I am fairly certain that if you stop right now and recall your top projects, there will be one or more within which you experienced destiny and synchronicity. Take a moment and think back.

Next, a Calling is something we answer for the transcendence through which we channel something beyond ourselves, not for its ability to fortify our self-esteem or reputation. Maybe it is a hugely significant and imposing problem in business strategy, corporate ethics, or public policy. Maybe it is a gaping hole or misunderstanding in our thinking about consumer behavior. Or maybe it concerns the undeniable suffering of people, society, or earth. Have you experienced such transcendence in a research project? Think about that for a moment.

In addition, when we have a Calling in research we comport ourselves knowing that there are no compromises, no shortcuts. With a Calling there is no room for sluggishness or getting half-way and then halting. Is this a research experience that you have had as well? Callings are rarely safe and easy, or otherwise they would be just a whimsical research question and a daydream of publication.

A research Calling is also often experienced as a blend of eagerness, positive emotions, and plasticity. Together these aspects help us see as many proximal and distal insights as possible that could be pertinent to the given topic. Psychology has shown that excitement and curiosity foster mental flexibility and resourcefulness (see, e.g., Frederickson 2013). By being radically receptive, we animate originality in our thinking, our intuitions, our analyzing, our writing, our collaborations, and so on. A research Calling is a passage into multi-layered creativity.

Furthermore, an authentic Calling in research often gives us a new perspective on who we are and who especially we are growing into be. It magnifies and multiplies us. It expands our self-insights into what we are far more fully capable of, if we will just be courageous and welcome all forms of learning. When were you last nourished by new professional and personal understandings because of a research project? It happens, doesn't it?

I have reviewed some key qualities of research Callings and also hinted at how they stir us. And there are more. For one, a research Calling feels as if we are drawn by a potent magnet that we cannot escape from. For another, a research Calling is regularly constituted by psychological flow. Most of us know from Czsiksentmihalyi's (1990) work that flow is characterized by intense concentration on the task, a transformation of time (speeding up and slowing down), a loss of self-conscious rumination, and a purpose of intrinsic reward, among other qualities. Turning now to more specific illustrations, I will share two of my own research Callings, based on what I have experienced.

TWO RESEARCH CALLINGS I HAVE EXPERIENCED

When I was settling in as a newbie doctoral student at Indiana University, I heard a mentioning of its Research Center for Language and Semiotic Studies. Given my background in philosophy and literature, it sounded very intriguing to me, even though I hardly knew at the time how to spell semiotics, let alone describe it. For those who may wonder, semiotics focuses on the metaphysics and pragmatics of communication and meaning, using an array of concepts such as signifiers, icons, indices, symbols, interpretants, abductive reasoning, and many others. At that time I was enrolled in my first seminar on consumer behavior and I was tasked with producing a paper as part of the course requirements. In short order I was encouraged by my senior professor—Richard Olshavsky—to go over to the semiotics studies center and check it out. Once I met its academic leaders and began reading about semiotics, I felt remarkably invigorated, but also overwhelmed by its technical verbiage and its scope. One stage of learning catapulted me to another and then another. I lost myself for hours in an enchanting labyrinth of readings, note-takings, re-readings, and more note-takings.

A few weeks later I handed in my exploratory paper on how semiotics might advance consumer research. Fortunate for me, Professor Olshavsky liked the paper. In fact, when I mentioned submitting it for a conference presentation, he roundly objected and told me I should send it to the *Journal of Consumer Research*. I was stunned. How could I ever measure up to this senior professor and to a leading journal at such a neophyte stage of my academic career? But I trusted his judgment, and I spent the next 12 months re-vising the paper over and over.

Eventually, I submitted the paper to *JCR*, and then a few weeks later its co-editor, Hal Kassarjian, sent the reviews and his decision letter—flooring me as well as my professor. The paper was accepted for publication after just the first round of reviews (Mick 1986). Yes, you heard that right, and I still can scarcely believe it. But I must quickly assure you that in the ensuing years of my entire research career I never came close to that rare outcome again. In fact, the very next paper I submitted to *JCR* was summarily rejected on first round. Welcome to the humility club!

When I look back, even though I did not know it at the time, I think my success with the semiotics paper was due to several qualities of research Callings being present. First, it was a perfectly serendipitous situation how semiotics came upon me and exerted its charisma. Secondly, as the project progressed, I became increasingly determined to dedicate only my strongest effort, including innumerable hours combing through the library stacks. Thirdly, the intensive thinking and writing about such a byzantine topic as meaning were richly nutritive to my intellectual development. Finally, and not to be dismissed, I remember having lots of fun throughout the project.

In another instance—this one recently during the closing years of my career—I took up a research Calling that had been reverberating in me for a long time. It involved a topic that had been profoundly important to me since shortly after I graduated with my undergraduate degree in the mid-1970s. I was in a bookstore one day, perusing the philosophy section as I regularly did, and I came upon some paperback books by an author I had not heard of before, namely, Alan Watts. As some of you may know, Watts was a young man in the 1930s when he became one of the first Westerners to travel to Asia to study Buddhism and other Eastern philosophies. He then returned to the West and began writing accessible and engaging books like *The Spirit of Zen* (1936), *The Meaning of Happiness* (1940), and *The Wisdom of Insecurity* (1951). As for myself, I had been raised in a conservative blue-collar American setting, including my thorough envelopment in Roman Catholicism. As I read several of Watt's books, I felt as though someone was taking hold of my head and cranking it 180 degrees, and then slapping me in the face a few times for final good measure. I would never be the same again.

Over the next 40-plus years I built up a large personal library on Buddhism, which I continue to revere and seek guidance from. Buddhism's foundations include the Four Noble Truths and its central concepts in the Pali language include (1) *dukkha* and *samsara* (which are the nature and cycles of unsatisfactoriness in daily life), (2) the cause of unsatisfactoriness, *tanha* (which means clinging and attaching), (3) *annica* (which signifies the impermanence of everything), and (4) *annata* (which means there is no distinct ego or sepa-

rate self). Such Buddhist precepts have been in the forefront of my life for a long time now.

As I moved through my academic career I kept reading, meditating, thinking, and note-taking about Buddhism. I also kept pondering whether I would ever have the courage, ability, and commitment to write a conceptual paper about Buddhism and consumer behavior, particularly since our field was historically engrained in the modernist paradigm of the Western social sciences. I spent much time asking myself, why do you want to write this paper? The proposition felt quite risky. No one in our field except Steve Gould (e.g., 1991) had written in-depth about Buddhism, and yet too there was so much more to say. Finally, I told myself: if you start this project, do it for the joy as well as the potential spiritual maturation; do not base the effort on how much the field might admire it or you.

In time I submitted the paper, and it was rejected on first round. Then it languished for another few years, until I felt drawn again to do what I knew I had to do—revise and submit to another journal. I did so, with much assistance from several Buddhist scholars I had come to know at the University of Virginia. One of them, David Germano, invited me during that same period to accompany him on a two-week trip to Tibet, including its capital, Lhasa. Needless to say, it was one of the most enthralling, humbling, and eventful trips of my life. I came back with new resolve and resilience for facing the Buddhism paper. Ultimately, I submitted again and eventually it found a home in the *Journal of Consumer Psychology* (Mick 2017). In this paper I sought to reveal how Buddhism can question, qualify, or extend such familiar topics as materialism, ownership, self-identity, expectations, and judgments.

So, why was this project a research Calling for me? Among other aspects, it felt preordained, inspirational, daring, boundless, and wholly apropos in terms of my personal background. It was a truly opportune and fulfilling challenge for me at that time, as if I had little or no choice but to accept it.

Can Research Callings Be Cultivated?

I think the answer is a qualified yes. Most often a research Calling must first approach us. However, there are certainly some things we can do ourselves to potentiate research Callings. Although I speak figuratively, I would say first: listen to what Saint Benedict called "the ear of the heart," particularly as to what in the realm of consumer behavior matters most to you, and reflect on why. Also, ask yourself: what subject matter in consumer behavior and consumer research can you not stop thinking about? Deliberate on this also: if you had only enough life left for one more audacious research project in your career—and no more—what would it be, and why? Or alternatively: if you had all the time, money, and talent you could ask for, what new research topic would you embrace, and why? And lastly, ask yourself: what topic in consumer research have you avoided so far that actually intimidates the hell out of you, and would force you to grow in astonishing ways, and why? Perhaps one of these suggestions or questions can help you discover your next research Calling.

CONCLUSION

Ralph Waldo Emerson—the American Transcendentalist philosopher—once asserted that "Nothing great was ever achieved without enthusiasm." I admire many of Emerson's insights, but in this one he's told only part of the story. From my perspective, to achieve something that is not only great, but also valiant, enduring, venerable, and awakening, it must be a Calling. I hope my related remarks have convinced you that research Callings are distinctive, real, and worth pursuing.

So, in closing, I could wish you perpetual publications, I could wish you copious citations to your work, and I could wish you noteworthy research awards. Really, what I wish you are research Callings. If together we answer those Callings well, I think we will be emphatically good—probably better—consumer researchers. Then, when we die, we will all go to Paris.

2020 ACR Fellows' Addresses

Helping Consumers Consume (Well)

Marsha L. Richins, University of Missouri, USA

I am so grateful to be receiving this honor today. And beyond that, I feel immense gratitude for the career that consumer behavior scholarship has provided me. I've had a lifetime of pursuing challenging questions, meeting interesting people, and working with phenomenal students.

Consumer behavior has been a fascinating field to study, and my views of consumer behavior scholarship have been strongly influenced by my early life experiences. I grew up in an era when marketing was looked upon with some distaste. Popular books and the writings of influential social scientists, had created a sense among the public that marketing is exploitive and manipulative. And there were no countering voices to explain the positive impacts that business and our economic system (more generally) have on society.

My first years in graduate school were as a social psychologist, because I have always wanted to know why people are the way they are. There, I learned a lot about human nature--through my academic experiences, and through a social life that would have horrified my parents if they had only known.

Yet, in graduate school, I also developed concerns about the somewhat artificial nature of social psychology research, as it was practiced at that time, and when the only professor in my department who was researching more pragmatic topics left for another university, I too left and began instead to study consumer behavior. One of the psychology faculty members reacted bitterly to my change of plans. He told me I was betraying my social conscience and never spoke to me again.

Those early experiences have colored how I approach the study of consumer behavior. Through research, I have tried to better understand why consumers buy what they do and why they buy so much. But now, looking over my past decades as a consumer behavior scholar, and at the extant body of consumer behavior literature, I've come to realize how little we know about consumption itself and how much more we need to learn.

I have spent nearly all of my academic career examining consumption. In graduate school and my first years as a professor, I studied product satisfaction and how consumers give voice to dissatisfaction. Later on, I studied the emotions evoked by consumption, the transformations consumers hope to achieve with their purchases, and (most extensively) the nature and correlates of consumer materialism.

Materialism has a bad reputation, with many negative correlates that have been identified in research. However, contrary to what some might think (and contrary to accusations occasionally leveled at my work by reviewers), I am not anti-consumption; in fact, I am very pro-consumption.

THE ESSENTIAL IMPORTANCE OF CONSUMPTION

In all these years of research I have been reminded, again and again, of the essential importance of consumption to our lives. Consumption is not the actual heart of our existence, but it's pretty close to the heart—maybe the lungs or the digestive tract. Consumption is an essential support system that allows us to live and thrive.

Consumption allows us to reach some of our most cherished life goals: to stay alive and be healthy, to be safe and connected to others, and to help our children flourish. It can help us reach the heights of joy, celebrate important milestones, and communicate who we are or want to be.

We consume food, clothing, medical services, and education. We buy gifts to solidify relationships and flowers to celebrate our weddings. We spend hours shopping for the perfect job interview outfit or choosing a tent for a camping trip. We buy sunglasses, cars, espresso machines, exercise equipment, and toys for our kids. The list is almost endless. And each of these purchases is made to meet a need that seems essential, and with the hope that the purchase will improve our lives in some way or the lives of the people we love: that the new suit will help us land a job, that the family campout enabled by the new tent will bring joy to our kids and create happy memories, and that a more reliable car will reduce the number of expensive, annoying trips to the mechanic.

Consumption provides endless possibilities and an infinite number of ways to improve our well-being, our efficiency in carrying out life tasks, our relationships with others, and the amount of pleasure we experience. The possibility of future consumption gives us hope. If I buy a bigger house, my kids will squabble less. A better tennis racquet might improve the accuracy of my serve just a little. If I had an instant pot, cooking dinner would be easier and dinnertime less frazzled. We expect consumption to transform our lives, and often times it does.

LIMITATIONS ON CONSUMPTION

Many people, however, have severe limitations on their ability to consume, making it difficult for them to obtain many of the goods and services that can enrich our lives. Some are limited by their low incomes. Almost 12% of the population in the United States lives in poverty (Semega et al. 2019). That's more than 38 million people living on annual incomes less than $26,000 for a family of four. Another 55 million people have less than $37,500 per household (Bennet, Fry, and Kochhar 2020; Parker, Horowith, and Brown 2020). Even before COVID-19, which resulted in job losses or wage cuts in many households, one in four adults reported that they can't pay some of their bills or can only make a partial payment on them in a typical month (Parker et al. 2020).

Other people's ability to consume is limited by high debt loads that prevent them from purchasing what they need and want. The statistics on consumer debt are sobering. For example, and this is before COVID-19, the average debt load for an adult between the ages of 24 and 39 was more than $78,000 per person, an increase of 58% since 2015 (Stolba 2020). This has only gotten worse in recent months as people have lost income and employment. In terms of credit card debt, nearly half of adults say they carry credit card debt from month-to-month (National Foundation for Credit Counseling 2020), and the average balance carried forward is nearly $7,000 (Issa, 2019). Ten percent say it will take them longer than 10 years to pay it off this debt (Issa 2019).

In addition to these problems of low income and debt, consumers are experience unforeseen calamities that tax their resources and limit their ability to consume. Layoffs, health problems, unplanned pregnancies, and car breakdowns occur at unpredictable times and can completely overwhelm a family without financial reserves. More

than half of households don't have savings that could cover their expenses for three months (Parker et al. 2020; FINRA Investor Education Foundation 2018) and about 30% would not be able to come up with $2,000 to cover an emergency (FINRA Investor Education Foundation 2018).

Going back to my original point: consumption is highly important—it is our lungs or digestive system, without which we could not live. But the ability to consume is fragile among American consumers and severely restricted, at best, for many.

CONSUMPTION INEFFICIENCY

And even when people are able to consume, they often are not very good at it. This is true across all income levels. I will describe three examples of consumer inefficiency, although there surely are more.

First, buyer's remorse and purchase regret are so common that there are hundreds of websites on these topics. One study found that 67% of consumers had more than one purchase within the last year that they later wished they hadn't. The study further estimated that between 2 and 10% of consumers' annual spending is on regretted purchases (Skelton and Allwood 2017). As another example, the *Consumer Reports* annual survey of car owners repeatedly finds low satisfaction for some commonly purchased cars, some of which are quite expensive, another indicator of suboptimal purchasing. Every unsatisfactory purchase is a waste of consumers' limited resources.

Second, even initially satisfying purchases often lose their luster, leaving their owners unsatisfied and looking to buy something new to reclaim the pleasure associated with the initial purchase (Richins 2013). This is the hedonic treadmill of consumption (Chancellor and Lyubomirsky 2011), and consumers who live on this treadmill are using their resources in ways that don't provide lasting satisfaction.

Third, we buy too much. Alana Semuels (2018), in an arresting article in *The Atlantic*, describes how consumers fall into the easy trap of buying things on Amazon—just a click away at any time of the day or night, and with free shipping. Amazon boxes pile up unopened, or when opened reveal a forgotten purchase that's not wanted anymore. On average, consumers purchase 68 garments every year (American Apparel & Footwear Association 2019) and 8 pairs of shoes (Sapun 2019), many of which are worn only a few times and then are no longer needed or wanted.

CONSUMER SCHOLARS CAN HELP

So, we see that consumers of all income levels could use some help in finding ways to consume more effectively. We, as consumer scholars, are uniquely positioned to provide this help through our research. There are several directions this scholarship could take.

First, we could study how people can achieve desired life improvements by consumption acts that don't involve purchases. Consumers buy products to improve their lives, or the lives of the people they love, in some way. Most improvements that people hope for fall into these main categories: to have more enjoyment in life, to have better relationships with others, to be more effective in daily tasks, and to increase their worth in the eyes of others (Richins 2011; see also Holbrook 1999). While it can be easy to rely on goods to provide these life changes, and advertising constantly encourages us to do so, the fact is that improvements in each of these areas can often be achieved at little or no monetary cost.

Voluntary simplicity movements throughout history have encouraged people to meet their needs with non-purchased consumption, and consumer scholars have occasionally examined consumption downshifting (Etzioni 1998; Shaw and Newholm 2002). But we tend to view such behavior as an anomaly and usually through the lens of ethical issues or sustainability. That is all well and good, but in terms of improving people's consumption effectiveness, we could undertake rigorous studies that examine how non-purchased consumption can meet people's needs and enhance their lives. We can conduct research that finds ways to help consumers understand the value of non-purchased consumption so that when they notice a life deficit, their first impulse is not to run out and buy something.

People with severely restricted financial resources are already adept at doing without, but a large percentage of the population would benefit from learning to live with less, before a crisis strikes. Given the vulnerability of such a large percentage of the population to calamities such as COVID, recessions, and layoffs due to technological change, research that helps consumers learn to live with less, without diminishing their quality of life, would be valuable to many consumers. And it is also worth noting that buying things to achieve life improvements often fails. If our purchases actually provided the benefits we hope for, we wouldn't keep buying so many things and would step off the hedonic treadmill.

A second way scholars can help people improve their consumption effectiveness is to delve more deeply into the causes of dissatisfaction and regret that often follow the purchase of goods and identify ways these negative outcomes can more often be avoided. While there are extensive literatures on regret and satisfaction (e.g., Pieters and Zeelenberg 2007; Szymanski and Henard 2001), few studies have tried to discover how consumers can avoid making regretted purchases in the first place. Although we've learned that realistic expectations are important in creating satisfaction, we haven't much studied how to help consumers develop more realistic expectations, especially in light of commercial media that continually promise that we can transform our lives with the products they advertise.

In a similar vein, encouraging people to think more deeply before purchase may reduce dissatisfaction and regret, and research should address this possibility. There seems to be some optimal level of search and contemplation before a purchase. Too much search and agonizing over a decision can raise expectations and increase the chance of dissatisfaction. Too little thought and too much impulsiveness can result in purchases that are used once or twice and then forgotten.

In my own research, I often ask people to think about a product they hope to buy and then to complete a transformation expectations measure. In this measure, participants indicate how likely it is that having the desired product will result in a variety specific life changes. It's about 15 items long. At the end of every survey, I have a space for people to make any comments they'd like about the study they just completed. A surprising number of times, participants have used that space to say something along the lines of "Now that I've completed this survey and thought about it, I don't think I really need to buy that item after all." Less often, I get the opposite comment, that after answering those questions the participant now really, really wants to buy the item they described. Either way, the activity of thinking about transformation expectations has made those study participants more informed and thoughtful consumers and perhaps enhanced their consumption effectiveness in some way at one point in time.

A third way scholars can contribute to people's consumption effectiveness is to study the portfolio of goods and services people consume and the association of this portfolio to well-being. In 1957, Wroe Alderson introduced the concept of potency of assortment. Consumers purchase an assortment of goods and services, and additions to this assortment are made to increase or maintain assortment potency—potency being the assortment's ability to meet the consumer's present and future needs. Despite the potential richness

of this construct, it has spawned almost no empirical work among scholars (see, however, Solomon's 1991 work on consumption constellations associated with consumer roles).

Investigation of the potency-of-assortment construct holds enormous potential for increasing the effectiveness of consumption and for the study of consumer well-being. A large number of research opportunities present themselves, but the essential question is: what assortment of goods and services, and at what rates of consumption, yield the greatest satisfactions to consumers? Because consumers are a heterogeneous lot, one assortment will not serve all consumers equally well. Perhaps there are clusters or segments of consumers who will benefit from different assortments. Or perhaps assortment potency for individual consumers can be tied to personal characteristics, whether they be demographic, stage of family life cycle, personality characteristics, or other individual differences. Most importantly for lower income consumers, portfolio potency can be linked to financial resource levels to help consumers obtain as much satisfaction from their consumption choices as their resources allow.

This topic calls to mind the extensive body of literature investigating whether experiences or purchased goods result in greater satisfaction or well-being. There are many articles on this topic, generally concluding that the consumption of experiences is more satisfying than the consumption of goods, but much greater depth in this literature is needed. All experiences are not equal and all goods are not equal in affecting well-being, and survival requires that we purchase some of each. A more interesting approach is to examine which goods and which experiences lead to greater well-being and under what circumstances, and to examine the optimal balance between experiences and goods in a consumer's personal consumption assortment.

CHALLENGES

The areas of inquiry I've suggested present hard problems. They are not easy topics to investigate, and they pose difficult conceptual and methodological challenges. But consumer behavior researchers have amazing talent. Scholars in our field are creative and have the ability to create path-breaking research. And I'm greatly impressed when I see the skills and insights that young consumer behavior faculty possess. They are brimming with ideas and devotion to scholarship. I hope some of these talented young scholars, along with more seasoned researchers, will turn their attention to some of the difficult questions posed here.

The research topics I describe argue for less, but more effective, consumption, and I realize that this runs counter to the interests of business at large. While firms strive to satisfy consumers and improve people's lives with the products they produce, the basic fact is that companies want to increase their sales, which occurs when people consume more.

To carry out such research, then, might seem slightly inappropriate to the many of us who are located in colleges of business. A dean once mildly chided me for doing "anti-consumption" materialism research, reminding me that business donors provide valuable support to the college. Indeed, as time passed and I realized how starkly my research contrasts with the more business-oriented work of other faculty members in my college, I have often asked myself the question: to whom do I, as a consumer behavior scholar, owe my research allegiance? Is it to businesses? To consumers? To society at large?

While my dean was absolutely correct in noting the value of business interests to my college, I gradually came to realize that there are also larger considerations. I think about who pays my salary. I think about the cost of providing electricity to campus buildings, of operating computing facilities, mowing the lawns, and providing the host of other services that allow a university to operate. I'm employed by a public university, and these costs are borne primarily by taxpayers and by student tuition, with additional bits of support from businesses. I'm grateful to firms for making my college a better place and providing employment opportunities to our students. But I also owe an obligation to the larger society that allows my university to operate.

And, to be honest, companies don't need the help of consumer scholars to thrive. They don't need us to help them understand consumers and to better market their products. They're already doing a great job of this and are already adept at increasing consumer desire for what they sell. Corporations have professionals that advise them on optimal resource allocation to ensure their success. But consumers are in it alone, with no in-house experts to help them effectively allocate their consumption resources, and they often do it poorly.

We as consumer scholars are uniquely positioned to help people improve their quality of life through effective consumption. And I hope that some of you with bright young minds, and those with mature and thoughtful minds, who are listening today will consider ways that you can improve the quality of consumption for all consumers, but especially for those with limited resources and in precarious financial situations.

Analytical Framework For Construal Level Theory That Incorporates Discounting

Makoto Abe, The University of Tokyo, Japan
Mitsuru Kaneko, Kyoto Women's University, Japan

INTRODUCTION

Almost everyone would have "procrastinated"—for example, in the context of dieting, quitting smoking, or doing homework. And, "pre-wedding blues" is another example of preference reversal. In the planning stages, a wedding seems to be a desirable event. However, as the wedding date approaches, there might be some hesitancy about getting married. This is because despite the promise of a desirable large gain in the distant future, people often tend to prefer earning a comparatively minor gain in the immediate future.

In behavioral decision theory (BDT), this phenomenon is often explained with "hyperbolic discounting" over time (Ainslie and Haslam 1992; Frederick, Loewenstein, and O'Donoghue 2002; Laibson 1997). However, the conventional properties of discounting cannot explain "pre-wedding blues" type of preference reversal. One approach to this challenge is to use more complicated discounting models. However, this approach arouses criticisms and complications. First, it is problematic that different discount functions produce different predictions of preference and behavior (Loewenstein and Prelec 1992; Rubinstein 2003). Second, its rigorous modeling can be quite complex because of various cognitive and emotional mechanisms in human behavior (Frederick et al. 2002; Zauberman et al. 2009).

To overcome these challenges, by incorporating the concept of "discounting" into construal level theory (CLT), we formulate our framework with three propositions. They are then validated through empirical study. Our framework can explain the insoluble "pre-wedding blues" type preference reversal in a simple manner.

LITERATURE REVIEW

Discounting

Prior research has shown three well-known properties of "discounting over time" (Benzion, Rapoport, and, Yagil 1989; Loewenstein 1987; Thaler 1981).

Invalidity of exponential discounting

A discount rate is not constant: it decreases rapidly at first and more gradually later.

Magnitude effect

A discount rate is larger for a small amount of money than for a large amount.

Sign effect

A discount rate is larger for a gain than for a loss.

Unfortunately, these properties alone cannot explain certain preference reversals such as "pre-wedding blues". One decided to marry one year later because the merit of getting married (gain) exceeded the cost of various nuisances (loss). The sign effect implies that, if the gain exceeds the loss one year before marriage, the gain will be even greater than the loss on the wedding day due to greater discounting for a gain than for a loss. This is the case whether the discount function is exponential or hyperbolic. Therefore, a standard discounting model fails to explain "pre-wedding blues."

Construal Level Theory

An alternative approach to preference reversal uses CLT (Trope, Liberman, and Wakslak 2007). CLT posits that when the psychological distance is long, people mentally construe the object as being at a higher level in terms of primary, abstract, and decontextualized features. In contrast, when the distance is short, they construe the same object as being at a lower level in terms of secondary, concrete, and contextualized characteristics. Such differences in mental construal lead to different evaluations and behaviors, and thus, preference reversal over distance. Pre-wedding blue occurs because when the marriage is far (long distance), its merit (high construal) is stimulated, whereas its nuisance (low construal) is stimulated when the wedding is near (short distance).

Psychological distance applies not only to temporal, but also to social, spatial, and hypothetical distances (Fiedler 2007). Therefore, one advantage of introducing CLT is the ability to explain preference reversal along a dimension beyond time.

PROPOSITIONS

Explanations of preference reversal that feature discounting are clear and persuasive, whereas CLT can deal with preference reversal along dimensions other than time. We combine the advantages of these two approaches to explain a wider range of preference reversals with simplicity.

Magnitude Effect

Let us consider how the discount rate changes owing to changes in construal levels. One theory on affect-dependent time discounting posits affective-based value undergoes steeper time discounting than does cognitive-based value (Loewenstein 1996; Metcalfe and Mischel 1999; Mischel, Shoda, and Rodriguez 1989). And, Conflict theory (Lewin 1951; Miller 1944) assumes the means of achieving a goal undergoes steeper time discounting than does the merit of the goal itself. Trope and Liberman (2003) state that cognitive attributes, merit obtained from a goal, and the outcome itself stimulate higher-level construals, whereas affective attributes, means of achieving a goal, and waiting time promote lower-level construals. These studies suggest a negative relationship exists between the construal level and the discount rate, leading to the following proposition.

Proposition 1: Magnitude Effect

The discount rate varies depending on the construal level: the higher the construal level, the smaller the discount rate.

Sign Effect

Previous studies found that the discount rate is higher for gain than for loss (Benzion et al. 1989; Loewenstein 1987; Thaler 1981). Following the past research, our second proposition concerns this sign effect.

Proposition 2: Sign Effect

The discount rate is larger for gain than for loss.

From Propositions 1 and 2, the discount rates d(•,•) for different construal levels and signs can be ordered as follows.

d(high construal, loss)<{d(high construal, gain), d(low construal, loss)}<d(low construal, gain)

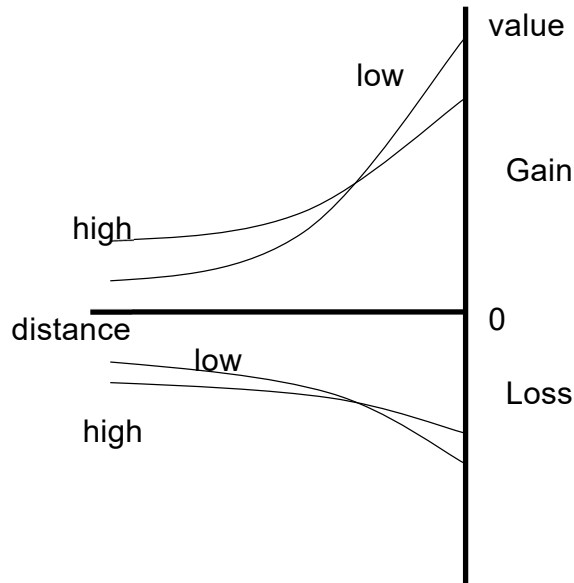
Because the order between *d(high construal, gain)* and *d(low construal, loss)* depends on the relative strength of the magnitude and sign effects, they are enclosed in {} without explicit ordering. Figure 1 clarifies how the values change with distance for high-level and low-level construals and for gain and loss.


Figure 1: Discounting implied by the magnitude and sign effects

A discount rate increases with the following order.
d(high construal, loss) <{d(high construal, gain),*d*(low construal, loss)}< *d*(low construal, gain)

Generalization of Distance

In BDT, the distance is strictly time-based, whereas, our framework can be applied to various psychological distances, including that of time.

Proposition 3: Generalization of Distance

"Discounting" applies to psychological distances, including time.

IMPLICATIONS

Our framework adapts the concept of discounting into CLT, and posits the sign effect and the magnitude effect. Note that, in BDT, magnitude corresponds to the amount of money or utility, whereas in our proposition, it corresponds to the level of construal.

According to the magnitude effect, as one comes closer to experiencing an event, the relative weight of the construals used for evaluation shifts from high to low levels. If the event is a product purchase, various product attributes can stimulate construals of various levels. For example, in Study 3 of Trope and Liberman (2000), using a radio with a built-in clock, subjects were manipulated such that the sound-fidelity attribute prompted a high-level construal, whereas the clock-quality attribute aroused a low-level construal. In an evaluation of gambles, Sagristano, Trope, and Liberman (2002) confirmed from four psychological experiments that a prize-amount attribute prompts a high-level construal, whereas a winning-probability attribute arouses a low-level construal.

By focusing the input and output of CLT, our framework bypasses the complicated and arguably controversial inner mechanism/process of human perception (Trope et al. 2003). Our propositions allow us to predict more easily how preferences would shift as distance varies, thus providing a useful analytical framework for pragmatic applications (Salisbury and Feinberg 2010). The advantages are summarized as follows.

a. Our framework can explain preference reversal along dimensions other than time.
b. When the distance is limited to time and the construal level is limited to a monetary amount, our framework coincides with ordinary "discounting" in BDT, and thus possesses the magnitude and sign effects.
c. When different levels (especially more than two levels) of construal exist and they are related either to gains or losses, our framework can explain and predict with simplicity how evaluation, preference, and behavior change as psychological distances vary.
d. The functional form of discounting, such as exponential or hyperbolic, need not be specified.

EMPIRICAL STUDY

To test the three propositions, we conduct a survey and collect data on how people's choice change with psychological distance. 416 students from a large university and 416 participants from online panel at a marketing research firm take part in the survey.

The survey asks participants to choose one of two lotteries with the same expected return: one with a higher prize amount and the other with a higher winning probability. We selected a lottery because previous research found that, in lottery choices, the prize amount and the winning probability leads to a high- and low-level construal, respectively (Sagristano et al. 2002; Trope et al. 2007).

We choose social and temporal distances as psychological distance. Social distance is manipulated through a lottery that is purchased either for oneself (short distance) or for a prize at a party (long distance). Temporal distance is manipulated through a lottery whose outcome is known either the next day (short distance) or one month in the future (long distance).

Magnitude Effect and Generalization of Distance

First, we test the magnitude effect (Proposition 1) and generalization of distance (Proposition 3). We compare the proportion of respondents who chose Lottery A (prize amount = $500, winning probability = 2%) vs Lottery B (prize amount = $100, winning probability = 10%) between distances within subject. The result summarized in Panel A of Table 1 shows that for both social and time distances, in both samples, as the distance becomes shorter, the respondents' preference shifts from Lottery A (high-level construal) to Lottery B (low-level construal). A paired McNemar test confirms that the proportion of respondents valuing a prize amount (high-level construal) over a winning probability (low-level construal) varies by distance at the 1% significance level. The exception is the case with a time distance for the web sample, which is supported at the 10% significance level. Therefore, the result supports Propositions 1 and 3.

Additional Evidence for the Magnitude Effect

To strengthen the first result, we scrutinize the magnitude effect (Proposition 1) under two scenarios of gain and loss. Here we investigate whether, with respect to deviation from a reference point, individuals place relatively more weight on a high-level construal than on a low-level construal when the distance is long, and vice versa.

Table 1: The Result of Studies

Panel A								
Distance		Student Sample				Web Sample		
		N	choice of A	p		N	choice of A	p
Social	Long	211	55.0%	<.001		208	37.0%	.010
	Short		35.1%				26.4%	
Time	Long	205	48.3%	<.001		208	31.3%	.078
	Short		30.2%				26.9%	

Panel B									
Distance & Frame			Student Sample				Web Sample		
			N	choice of A / C	p		N	choice of A / C	p
Social	Gain	Long	205	62.9%	.002		208	47.6%	.046
		Short		46.8%				39.4%	
	Loss	Long		63.9%	.017			54.3%	.033
		Short		53.2%				46.2%	
Time	Gain	Long	211	51.7%	.193		208	47.1%	.430
		Short		46.9%				44.2%	
	Loss	Long		57.3%	.557			50.0%	1.000
		Short		55.5%				50.5%	

Panel C									
Distance	Switch From	N	% of switch	χ^2		N	% of switch	χ^2	
Social	A	44	56.8%	.004		34	47.1%	.001	
	B	59	27.1%			70	12.9%		
Time	A	39	53.8%	<.001		33	21.2%	.017	
	B	57	15.8%			71	4.2%		

In survey, each respondent is asked to imagine buying Lottery R (prize amount = $500, winning probability = 2%); this creates a reference point in his/her mind. Under the gain scenario, due to a special campaign of double the expected return, Lottery A (prize amount = $1000, winning probability = 2%) and Lottery B (prize amount = $500, winning probability = 4%) are available, whereby the gain is from doubling the prize amount and the winning probability, respectively. Then, respondents are asked to choose Lottery A or B.

Under the loss scenario of half the expected return, Lottery R was sold out on account of its limited quantity; for the same price,

Lottery C (prize amount = $500, winning probability = 1%) and D (prize amount = $250, winning probability = 2%) are available, whereby the loss is from halving the winning probability and the prize amount, respectively. Then, respondents are asked to choose Lottery C or D.

Comparison of the two value functions, high and low, in Figure 1 predicts preference shift from A (high) to B (low) for gain and C (low) to D (high) for loss, respectively, as distance becomes close. The result of a paired McNemar test (Panel B) confirms that, for social distances, as the distance shortens, the respondents' prefer-

ences shift from A to B and from C to D, in both samples at the 5% level. For the case of a time distance, however, the test results are not significant although the directions are correct. Here, under both gain and loss scenarios, we find that for a social distance, the respondents' construal level is higher when the distance is long, and vice versa. The result supports the magnitude effect (Proposition 1), but only for a social distance.

Sign Effect

Secondly, we test the sign effect (Proposition 2). A respondent is first asked to choose one lottery from Lottery A (prize amount = $500, winning probability = 2%) and Lottery B (prize amount = $100, winning probability = 10%) under a long distance. The survey then asks whether he/she would switch from his/her initial choice as the distance becomes short.

A switch from Lottery A to Lottery B trades off the loss in a high-level construal (prize amount) over the gain in a low-level construal (winning probability). The sum of this loss and gain represents the net value of switching to Lottery B. For those respondents who chose Lottery A initially when the distance was long, this net value was negative. However, due to the difference in discount rates—$d(low\ construal, gain) > d(high\ construal, loss)$ —the net value increases rapidly as the distance becomes shorter. When the net value turns positive, preference reversal to Lottery B occurs. In Figure 1, this situation corresponds to summing two value functions, [low; gain] and [high; loss].

Likewise, the net value of switching from Lottery B to Lottery A is the sum of the loss in a low-level construal (winning probability) and the gain in a high-level construal (prize amount). For those respondents who chose Lottery B when the distance was long, this net value was initially negative. This time, however, the difference in discount rates between $d(high\ construal, gain)$ and $d(low\ construal, loss)$ is minor. Consequently, the net value does not change much as the distance becomes shorter. If the net value turns positive, Lottery A becomes more attractive than Lottery B under a short distance. With the small change in the net value, however, preference reversal is less likely to occur than in the previous case. In Figure 1, this situation corresponds to summing two value functions, [high; gain] and [low; loss].

The result (Panel C) shows that, in both samples, for social and time distances, a switch from Lottery A to Lottery B is more likely to occur than a switch from Lottery B to Lottery A as the distance becomes shorter. A chi-square test shows the proportion of respondents switching from Lottery A is larger than that switching from Lottery B at the 5% level, for both social and time distances in both samples. Therefore, the result supports the sign effect (Proposition 2).

GENERAL DISCUSSION

In BDT, discounting is often used to explain preference reversal. However, discounting cannot explain preference reversal such as "Pre-wedding blues". The current research incorporated discounting into CLT to explain such preference reversal.

We presented three propositions that were statistically validated. Proposition 1 pertains to the magnitude effect. Panels A and B largely supported the magnitude effect. Proposition 2 pertains to the sign effect. Panel C supported the sign effect. Proposition 3 pertains to a generalization of distance. For time and social domains, Panels A~C supported this generalization statistically.

The advantages of our approach are two folds. First, our framework can predict preference shifts and behavioral changes as distance varies in a simple manner, providing a useful analytical framework for pragmatic applications. Second, preference reversal over more general distance beyond a time axis can be accommodated.

There are various research possibilities for extending our framework. First, validating other psychological distances such as spatial and hypothetical distances is an obvious next step. Second, by calibrating parameters at the individual level, heterogeneity in the magnitude and sign effects among people can be better understood. This enables us to understand differences in their preferences and behaviors more precisely. Such knowledge would be especially useful in the areas of marketing and policy-making.

In the Flow: Materiality, Value and Rubbish in Lagos

Precious O. Akponah, University of Leicester, UK
Ai-Ling Lai, University of Leicester, UK
Matthew Higgins, University of Leicester, UK

INTRODUCTION

In this paper, we invite consumer researchers to rethink the place of rubbish in the co-production of values in everyday life, with disposal conceptualised as a recursive practice which is inextricably entangled with the processes of consumption and production (Parsons and Maclaran, 2009; Hetherington, 2004). According to Parsons (2007) and Benton (2015), consumer researchers have tended to overlook disposal as an area of study, instead favouring studies pertaining to the acquisition and consumption of goods.

When disposal is explored, there is a tendency to consider such a practice to be a final act in a linear sequence following production, acquisition and consumption (see Gregson et al, 2010; Sherry, 1990). Such a view presumes that the value (of goods), once produced, is stabilised through consumption rituals and practices (e.g. be it through rituals of possession, gift-giving, sharing) until the onset of value exhaustion that leads subsequently to depreciation and disposal (Parsons, 2007). Rubbish is thus considered to be of 'no value' (Thompson, 1979) and is therefore a dirty post-consumption residual (Tudor et al., 2011; Douglas, 1966; Munro, 1992) that must be 'moved along' (Gregson et al, 2007; see Gabel, Mansfield and Westbrook, 1996; Phillips and Sego, 2011) and/or repurposed (see Cherrier, 2009; Trudel, Argo and Meng, 2016; Ture and Ger, 2011; Albinsson and Perera, 2009; Laitala, 2014). While the repurposing of rubbish (through practices of reusing and recycling) extends the value of goods – suggesting a 'circularity in the movement of goods' (Figueiredo and Scaraboto, 2016; Parsons and Maclaran, 2009: 301;) – these studies nevertheless maintain the 'absenting' of rubbish from everyday life until they are given a new lease of life (Hetherington, 2004). Indeed, failure to 'move things along' is considered to be a disruptive act (e.g. hoarding, cluttering) that brings about disorder in domestic spaces and material culture (see Maycroft, 2009; Cherrier and Ponnor, 2010). These studies, thus, reflect a modernist agenda predicated on practices aimed at systematically managing the boundaries that hold rubbish in abeyance (Tomic, Trumper and Dattwyler, 2006). Such a modernist agenda is particularly prevalent in discourses on waste management and environmentalism in the developed worlds (Gregson et al, 2010). As Arnould (2014) observes, consumer studies' pre-occupation with advanced capitalist market economies has blinkered our theorisation of value as being predicated on market exchange, and thus, has obscured human creativity (sociality) as the cornerstone of value creation. In short, a modernist view of waste management in advanced consumer society risks overlooking 'rubbish' as constitutive of value creation and production (O'Brien, 1999, 2008) whilst discounting the performative role of rubbish in generating the social and political dynamics of everyday life.

Through an ethnographic study of waste handling in Lagos, Nigeria, we follow the 'flow of rubbish' (Appadurai, 1986; Gregson et al, 2010) to explore the value entanglement between urban dwellers (which include householders and scavengers) and the materiality of rubbish. As in most developing economies, rubbish occupies a prominent material presence in the mundane spaces of everyday life in Lagos. Here, rubbish not only fuels the socio-economic lifeblood of urban dwellers, it is also integral to the formation of informal market that often shapes the social life of these actors (see Samson, 2015; Rogerson, 2011; Lepawsky and Billah, 2011). This paper, in some way, responds to Gregson et al's (2010: 846) call to 'follow the flow of things' down the value chain to 'less developed worlds,' where the value of things are never fully stabilised as they constantly undergo endless processes of assembly disassembly and reassembly.

In this paper, we ask what it is like to carve out a living amidst rubbish. To what extent has a modernist discourse of waste management infiltrated the everyday life of urban dwellers in a developing economy like Nigeria? How do values circulate, become contested and flow in such an economy? How do practices of disposal shape the social relations of those who are entangled with it? To address the above questions, we draw on Appadurai (1986) and Arnould's (2014) practice theory of value creation to shed light on how values are contingent upon the relational entanglement between social and material relations.

Towards a Practiced-Based theory of value creation

Most marketing and consumer studies that address the value of objects have built upon Arjun Appadurai's (1986) reappraisal of Marx's (1976) conception of value – i.e. as a product of the sum of labour required to produce things and with a focus on how such value might be measured in qualitative or quantitative terms. For Marx, the 'usefulness of things' does not necessarily translate into commodity; instead a thing only becomes a commodity if it produces use-value for others and, in a market system, this is predominantly transferred through monetary exchange. Appadurai (1986), however, cautions against limiting the conceptualisation of value creation to market exchange (Appadurai, 1986; Kopytoff, 1986). Instead, he calls for the need to attend to social and material relations by 'following the circulation of things', which at times also embrace other forms of value regimes (such as bartering, gift-giving or market relations).

Appadurai (1986) argues that value creation is contingent upon mundane social interactions and that it is through such a relational approach that objects animate and take on a 'social life'. Such a view problematises conventional understandings of use value in marketing as either residing in the object or in individual perception of said object (Karababa and Kjeldgaard, 2014; Arnould, 2014). It also calls into question the agency attributed to marketers, who appropriate use value as a resource for identity-construction as necessarily accomplished through a systemic top-down process of meaning transfer (ibid: 2014; see McCracken, 1986; see also Curasi, Price and Arnould, 1998).

Concurring with Appadurai (1986), Arnould (2014) proposes the need to employ a practice-based approach to studying value creation. Such an approach assumes value as an outcome that is contingent on practices of production and consumption, and that such practices are enacted through co-ordinating a web of human and material relations. In other words, it is practices, rather than individuals or institutions that assume the performative role as a 'carrier of values' (ibid: p.130) as well as (we may add) the producer/destroyer of values. For Arnould, 'the interaction of productive and consumptive moments is key to the realisation of use values' (ibid: 131). Productive moments involve the process where materials are offered as forms of resources while consumptive moments entail the reception of such resources. It is in these moments of cross interaction that active and inactive carriers of practice (subjects, objects and networks) come together to perform the work of value co-production/co-destruction.

As Arnould (2014) suggests, instead of asking 'who' and 'what system[s]' produce values, we should instead question what kind of values are produced in particular forms of regime. For instance, to fully capture the regimes of value creation in market economies, we must ask, what affords an object its commodity candidacy (Appadurai 1986)? For Appadurai, such a question must be addressed by tracing the social life, practices and politics that become enmeshed with the commodity during moments of exchange. By attending to the cultural biographies of things (Kopytoff, 1986), researchers are able to observe how an object moves in and out of its commodity state. In the context of this study, we similarly ask, what regime of value shapes the movement of objects and commodities in and out of their 'rubbish' state? What values are produced in regimes where exchange is performed outside of formal market exchange?

METHODS

This paper presents findings derived from a 6-months ethnographic study with six key stakeholders involved in the organisation of rubbish in Lagos (i.e. Lagos Waste Management Authority [LAWMA], householders, itinerant scavengers, dumpsite scavengers, junk artists and Wecyclers [a social enterprise promoting recycling]). Utilising multiple data collection methods, which include participant observations, self-reflexive observations, field interviews, diaries, photographs and videos, we traced the social life of rubbish, particularly its trajectory as it moves across different spaces (i.e. from households to landfill and sometimes recursively back to households). Our methodology follows a more-than-representation approach (see Hill et al. 2014), which emphasises the pre-reflexive and embodied immersion in the onflows of everyday life in the production of knowledge (Thrift, 2007). Through a more-than-representational approach, we incorporate both textual (representational) and corporeal (non-representational) accounts of how values are created, produced and circulated through different spaces in different interactional encounters.

CONTEXT AND FINDINGS

In this paper, we discuss two regimes of value in our ethnographic data: (1) the social shaping of the informal economy and (2) embodied categorisation of value.

The Regime of Value and the Social Shaping of the Informal Economy

As Lagos faced continual struggle with their handling of mounting waste in the city (Oyeniyi, 2011), the Lagos State Government established the Lagos Waste Management Authority (LAWMA) in 1991. Through the Cleaner Lagos Initiative (CLI), LAWMA is entrusted with the responsibility to implement waste management policies befitting of a modern city, whereby Western practices of reducing, reusing and recycling of waste are reinforced (Ezeamalu, 2017; Akiyode and Sojinu, 2006). Despite such an initiative, the crisis persisted as household rubbish remained uncollected, prompting urban dwellers to seek alternative channels to deal with the overflow of waste. This has spawned the flourishing of an informal waste industry, wherein cart pushers, scavengers and social enterprises step in to undertake waste collection for householders in return for fees (Araba, 2010). It is under such a condition that our ethnographic data reveals the emergence of a mutually beneficial relationship between the householders and the informal actors, which is predominantly driven by economic exchange, as exemplified by our observation of Mary:

"I tell my children to look out for the aboki's[1] [itinerant scavengers] because they normally come to our street. So, we sell most of (the) rubbish to them…I reserve my plastic bottles for the bicycle boys [Wecyclers][2] so that I can at least I get something from them no matter how little… something is better than nothing. The rest we throw into the bush." (Mary, slum dweller, on-site interview)

Living in the slum, Mary's dwelling is often overflowing with rubbish. Although the handling of waste in her slum is 'formally' operationalised by LAWMA, however, this has often been neglected as the Lagos Government is more inclined to deploy resources to sanitise more prominent neighbourhoods (Ezeamalu, 2017). Most slum dwellers, like Mary, would often resort to 'selling their rubbish' to informal actors, particularly the itinerant scavengers, who are themselves economically disadvantaged. At the same time, Mary also attempts to extract value from rubbish by pushing it through social enterprises, which provide her with an alternative source of income. For these actors, rubbish assumes a recursive presence (Hetherington, 2004) that yields 'a continuous return', and therefore its value is unstable as it oscillates in and out between rubbish and commodity states interchangeably (Appadurai, 1986).

In the event where rubbish fails to 'move along' (Gregson et al, 2007) the formal and informal channels, they will then be removed from domestic spaces to interstitial spaces (which are usually located within close proximity – e.g. bush, kerbside, gutter) through practices of fly-tipping. In turn, such a space becomes a treasure trove for itinerant scavengers to retrieve rubbish and to resell it to actors with buying power (e.g. buyers, scrap-dealers). This is exemplified below by Jide:

"I started picking (in the streets) before I became the number one destroyer…This job is important because if you buy an engine (broken) and don't know the difference between iron, metal, and copper you will not be able to extract the value…You have to take the objects apart piece by piece, everything… You need to separate (aluminium from iron) so that you don't end up selling something worth N50.00 for N10.00. We sell in kilos so if you don't destroy (dismantle) it, the entire engine will be sold as iron even though there is more valuable aluminium within it." (Jide, itinerant scavenger, on-site interview)

According to Jide, an experienced itinerant scavenger would possess the know-how in distinguishing the values of different materials. In this instance, aluminium is considered by buyers/scrap-dealers to be more lucrative compared to iron as it commands better exchange value. To maximise their resell value, itinerant scavengers must also engage in the work of disassembly (see Figure 1) by segregating the valuable materials from the 'not-so-valuable', and the former will in turn be reassembled by the buyers/scrap-dealers into a profitable commodity (Gregson et al, 2010). As will be witnessed in Theme 2, informal scavenging would soon come under threat due to the privatisation of waste management.

---

1   Aboki is a Hausa term which means 'friend'. It is also a word that is often used in a derogatory way to refer to poor migrant workers engaging in lowly paid jobs.

2   Wecyclers operates a reward programme that is points-based. Households earn points for plastics given to Wecyclers and these points are redeemed quarterly by receiving items like toasters, irons and cooking utensils.

FIGURE 1: Itinerant scavengers dismantling broken engines in a scrapyard

Scavenging in the Landfill: Embodied categorisation of value and social hierarchy

In October 2004, the Lagos State Government privatised their waste management practices through a new reform, which saw the establishment of the Private Sector Participants (PSPs). The PSPs attract private businesses who receive remuneration from LAWMA to oversee the management of waste. Consequently, this instantaneously criminalised practices of itinerant scavenging. In an attempt to avoid prosecution, many informal scavengers were forced to retreat to state-owned landfills to eke out a living. From the government standpoint, such a move is welcomed as the once informal scavengers can be 'hidden away' in the spaces of the landfills as part of the initiative to remove the unsightly and the undesirable other from the streets of Lagos. Unlike scavenging on the streets, retrieving materials in the landfill is a competitive business that requires an embodied know-how in categorising objects and their values. This is explained by Efe below:

"If you come to the business of scavenging (in) the dump...just with my eye, I will tell you this is gold, and this is not gold. If you look at this ring, to the ordinary eyes, they don't know what it is. But this is white gold, I saw it from the dump, and I just picked it in seconds. I can sell it for N20,000 (£41) depending on the area. If I don't want to go far, if I want to sell it in Ajegunle, I can sell it for like N6,000 (£13) or N7,000 (£15)." (Efe, landfill scavenger, on-site interview)

Efe emphasises how the cultivation of embodied skills become integral to identifying and categorising objects in the landfill. Such corporeal engagement with objects is necessary in a space where scavengers jostle for valuable materials. According to Efe, engaging with the tactile qualities of objects is conducive to deciding the geographical locations where the value of his foraging can be maximised. Once a landfill scavenger acquires bodily and territorial competence, they are likely to ascend the social hierarchy within the landfill, and for the successful few, go on to become a buyer.

CONCLUSION

This paper sets out to conceptualise the act of rubbishing as more than a final act of disposal, rather it entails recursive processes of value creation and destruction that shape the social relations between different actors. While many studies assume the absenting of rubbish from everyday life, our study reveals how the conspicuous presence of rubbish (in the developing world) becomes interwoven into the fabric of social relations, as evident in the market formation of an informal economy and landfill hierarchy. Unlike previous studies, we find that rubbish does not always constitute the destruction of value; rather its status as a 'valuable' object is always coming-into-being and its candidacy as a commodity is variously contested.

TABLE OF FINDINGS

Themes	Descriptions	Participant Data
The Regime of Value and the Social Shaping of the Informal Economy	This theme explores how rubbish circulates and moves along informal channels. Here, rubbish assumes a recursive presence in the spaces of everyday life, both as a source of economic return as well as a problematic object. This theme reveals the formation of social relations surrounding practices of disposal that bypass the formal channel.	
	Precarious social tension between informal actors (itinerant scavengers) and law reinforcement agents [i.e. police, LAWMA, Kick Against Indiscipline (KAI)]. The latter are charged with policing the informal activities of scavenging.	"(If you) look at this rim, it is damaged but if I pick it (up from the gutter to be wheeled to the scrap-dealer), the police will accuse me of stealing it …if you think of the stress (of dealing with the police)…. we just pay them." (Bayo, itinerant scavenger, in-depth interview).
		"Our challenges are KAI, LAWMA, and (the) Police…they make life unbearable for us. KAI's challenge is that they know that we are paying tax to the Lagos State Government. The Lorries we use in loading our scraps are paying revenue, do you understand? And our boys (itinerant scavengers) before they go to work they will buy a sticker from the state government that allows them to push the carts….If they see a scavenger without one, they will arrest him, and you will pay a fine of N4, 500 (£16) before they will give you your cart back. As the State Government know that each Local Government has their own sticker, they have to leave us to do our business because they are collecting money for the sticker. We pay our taxes, but we still have challenges…although, we have already solved the problem with KAI for up to 10 years now" (Idris, scrap dealer, in-depth interview).
	The informal dealings between householders and informal actors (itinerant scavenger, junk artist, social enterprise)	"I picked up this odo (discarded mortar) on the street in 'Alagumeji' (slum). I am not sure why I picked it…but…it would be useful for my work. I use it as a base for my painting brush and board and nothing more." (Peter, junk artist, in-depth interview).
Scavenging in the Landfill: the embodied categorisation of value and social hierarchy	This theme explores how regime of values is contingent upon embodied and material interactions. In this theme, we observe the competitive nature of scavenging in state-own landfill and how possessing an embodied know-how in categorising the value of rubbish can enable scavengers to ascend the social hierarchy in the landfill. We also witness how such competitive scavenging in landfills is structured along gendered line.	"The practice of scavenging does not only require the expenditure of physical energy. Knowing the right tactics can make one's life easy in the dumpsite. It is always better to have a sack quarter-filled with brass, aluminium, and copper than a sack filled with iron. It is difficult to move in the dump because of the soft, sinking and sloppy surface of the dump" (Field Diary – 29/08/2015, shadowing a landfill scavenger).
		"The women cannot stand that because if they try to go for the metals, copper, it's too expensive. They won't see it because the men are stronger, they will guide them and collect it. The boys leave the plastic and some of the cans and the nylons for them" (Ade, landfill scavenger, on-site Interview).
		"We are friends. But when we are working, there is no friendship because it's a jungle. The dump is a jungle where the lion goes for the big kill. After the lion feeds, the hyenas and the vultures can then come in. In the dump, the lions are the strong boys. They go for the truck, they scatter, and they fight. We fight ourselves to get it. After that, the ones who are not that strong, who don't like struggling, would stay behind. These are the hyenas. Some women still come close but when the truck leaves, the women will be crying to the boys, 'Egba mi Fun mi eleyi, Egba mi Fun mi eleyi' (meaning please give me this, please give me this). So these are the vultures because they feast on the remnants, they wait to take the food off after the lion is satisfied" (Efe, landfill scavenger, in-depth interview).

Volatile Bodies in the Digital Age. Consumer Vulnerability and Resistance in Online Bodily Experiences of Pregnancy.

Camille Anin, Université Grenoble-Alpes, France

INTRODUCTION

From everyday life choices to more occasional choices, consumption plays a key role in negotiating one's identity as a pregnant woman and in affirming its future role of mother (Sevin & Ladwein, 2008 ; Min & Peñaloza, 2019): buying maternity clothing (Ogle, Tyner & Schofield-Tomschin, 2013), organizing a baby shower (Fischer & Gainer, 1993), preparing the child bedroom, having the maternity bag ready (Sevin & Ladwein, 2008), modifying its food consumption (Sevin & Ladwein, 2008) and its beauty routines (Marie, 2016). Nowadays, most of the experiences of pregnancy can be mediated through the use of digital technologies. In addition to blogs and forums, self-help groups of mothers and mothers-to-be are flourishing on social media. And mobile apps offers the possibility to follow the growth of the foetus through personalized 3D pictures, in addition to providing access to information ranging from advice to schedule medical appointments to the characteristics and underlying reasons of bodily changes.

Despite a growing literature on the effects of technology on consumers' lives (Venkatesh, Meamber and Firat, 1997; Mick & Fournier, 1998; Schau & Gilley, 2003; Belk, 2013, 2014; Bardhi & Eckhardt, 2017) and on consumers' bodies (Buchanan-Oliver & Cruz, 2009; Belk, 2013; Roux,& Belk, 2019; Matich et al, 2019), no research in consumer behavior, to the best of our knowledge, addresses the consequences of digital technologies on the experiences of pregnancy. Yet, pregnancy is a liminal state during which power balance between consumers and the marketplace are particularly likely to evolve, potentially endangering the "*affects personal and social perceptions of self* " (Baker et., 2005).

This paper considers there is a need to conduct research in this area in order to have a better understanding of the digital experiences of contemporary mothers-to-be and its consequences on the power balance and its consequences on the power balance between consumers and the marketplace. To this aim, we chose to explore how reembodiment in digital settings shape the experiences of pregnancy, paying a specific attention to both consumer resistance (Mikkonen et al., 2011; The Voice Group, 2012) and consumer vulnerability (Baker et., 2005; The Voice Group, 2010).

To further investigate the effects of digital technologies on the experiences of pregnancy, we conducted 18 semi-structured interviews and participant online observation on pregnancy-related Facebook groups, in order to explore the effects of digital technologies on the bodily experiences of pregnancy building on literature on body and embodiment in consumer research (Belk, 2013 ; Matich et al, 2019) so as feminist literature (Grosz, 1993). Firstly, we will shortly review the literature on the transition to motherhood and on the digital technologies and the body in consumer research. Then, we will present our methodology and findings. Finally, we will discuss the implications and limitations of our results before making suggestions for future research.

TRANSITION TO MOTHERHOOD

Feminist researchers were the first to look at pregnancy as both an individual experience and a social construction (Rich, 1977; Oaxley, 1979) and more contemporary researchers (Miller, 2005 ; Nash, 2012) continue to provide a sociological account on this understudied feminine experience. Since the 1990's, transition to motherhood as a research object in consumer behavior is receiving a growing amount of attention (Fischer & Gainer, 1993; Jennings & O'Malley, 2003 ; Sevin & Ladwein, 2008 ; Prothero et al., 2006; Min & Peñaloza, 2010, 2019; The Voice Group, 2010, 2012; Tonner, 2012; Ogle, Tyner & Schofield-Tomschin, 2013). Pregnancy is described as a key moment of identity transition where consumption plays a key role in the material, emotional and social preparation of motherhood (Sorensen & Thomsen, 2006). Banister & Hogg (2010) highlight the experience of possible selves during the transitional phase of pregnancy. Being pregnant implies navigating across different discourses, whether media, medical, social and political discourses on motherhood (The Voice Group, 2010). The aspirational rhetoric of marketing discourses on pregnancy and motherhood may contribute to create gaps between the ideal and actual experiences of women, leading to consumer vulnerability (The Voice Group, 2010) and to consumer resistance (The Voice Group, 2010 ; Tonner, 2012). Both the Voice Group (2010) and Tonner (2012) refers to Rich's distinction between motherhood as a set of ideals and mothering as actual experiences of being a mother (Rich, 1977). The power of cultural discourses and social norms in negotiating one's identity, through consumption, as pregnant women can also be observed in the bodily practices and pregnant embodiment (Min & Peñaloza, 2019). The concept of agentic body highlights the importance of the body in the routines and behaviors of mothers-to-be and the complex dynamics of embodiment and disembodiment that structures pregnancy in terms of bodily experiences - and associated bodily management (Min & Peñaloza, 2019).

DIGITAL TECHNOLOGIES & THE BODY IN CONSUMER RESEARCH

Embodiment is particularly important regarding digital technologies. If the relationships between self-identity and the body has been a central question in Western philosophy and were mostly envisioned through the lens of the Cartesian mind/body dualism, the emerging of digital technologies encouraged researchers to reconsider materiality and corporeality. A view of the digital body that posits an entanglement between embodiment and digital subjectivity has been developed by Hayles (1999) and has had a considerable influence on how researchers envisioned digital environments (Belk, 2014 ; Matich et al, 2019). Nowadays, if this cartesian conception is still part of the cultural narratives, it is increasingly discussed by academic researchers regarding both offline (Roux & Belk, 2019) and online environments (Hayles, 1999 ; Shilling, 2005; Belk, 2014; Buchannan-Oliver & Cruz, 2009). According to Belk (2013), digital technologies induce five main changes: dematerialization, reembodiment, sharing, co-construction of self and distributed memory. Reembodiment is related to the experiences related to embodiment/disembodiment related to digital environments that enables "new constructions and definitions of the self." (Bolter, 1996, quoted by Belk, 2013). Matich and colleagues (2019) highlights, through the case of Free The Nipple, how bodies can be appropriated in digital environment as places of transgression and contestation of existing order without actually leading to political changes in real life, questioning how reembodiment is structured by power struggles in digital environments. The ubiquity of technology in consumers' lives blurred the distinctions between the mind and the body, the body and technology, underling identity concerns and the tensions between control and freedom as particularly relevant aspects of body

and technology (Foucault, 1995 ; Buchannan-Oliver & Cruz, 2009). By considering the body as a Mobius strip and using the plural bodies, Grosz (1993) uncovers the ability of the body to be psychically appropriated through physical experiences ("inside out") and physically appropriated through psychological experiences ("outside in") without the possibility to isolate one from the other. Such framework may help to have a better understanding of the impact of digital technologies on bodily experiences and provide an interesting perspective on technology and consumer well-being (Andreasen, Goldberg, & Sirgy, 2012).

METHOD

In order to investigate the impact of digital technologies on the experiences of pregnancy, we conducted 18 semi-structured interviews on various themes: the experiences of pregnancy, the changes and maintenance of consumption routines, the use of digital technologies and mobile apps related to pregnancy, pregnancy and motherhood ideals. Respondents (aged from 19 to 40 y.o) were recruited in prenatal classes and through online posts on Facebook pregnancy support groups in order to ensure socio-demographic diversity of the sample. Interviews were conducted face-to-face or over the phone. Due to our research topic, an ethnographic approach to digital media was also considered valuable (Coleman, 2010). Online participant observation of Facebook Group was a key material to be familiar with online experiences of pregnancy as topics included most of the online and offline experiences of pregnancy. Observations were made from October 2019 to February 2020. Due to intimate character of those online digital material and to the ethical concerns about collecting online data on such sensitive topic, no raw material was collected as such. Online field notes were exclusively made of observation and reformulated verbatim. Permission was asked to use such quotations in a research work. Interviews were conducted and analyzed building on Kvale's guidelines (1996 ; 2006) and online research complied with Elgesem's ethical principles (2002).

FINDINGS

In interviewees narratives, digital environments echoes a lot of different environments from blogs to specialized website, Instagram accounts and Facebook groups to pregnancy apps. We purposefully chose to closely investigate Facebook groups and pregnancy apps as it was reported by interviewees as digital environments that shaped their bodily experiences all along the pregnancy. Although all interviewees of our sample were part of private Facebook groups of mothers-to-be, it is worth being noted that not all interviewees were using pregnancy apps. Yet, most of them did and emphasize the role of the app(s) in their transition to motherhood, whether when it was their first child or not. Facebook groups and pregnancy apps offer pregnant women new opportunities to experiences liminality, liminality being defined as the second phase of a rite passage which consists in distancing oneself from its former role to incorporate a new one (Van Gennep, 1909). As underline Fischer & Gainer (1993) with their investigation on baby showers, the absence of traditional rites of passage leads Western women to create new rites of passage in this transition of pregnancy. Yet, these rites are a small number and pregnancy in post-modern societies can be experienced as a stressful event. A plethora normative discourses on pregnancy shape personal and social expectations, still it is perceived the mother's own responsibility to create her rites of passage which very often requires acts of consumption. Facebook groups and pregnancy apps are depicted by interviewees as ways to renegotiate their bodily experiences during this transition phase by escaping normative discourses on pregnancy, « feeling » pregnant and learning how to be a literate consumer.

Escaping normative discourses on pregnant bodies

Women need to navigate across powerful discourses on pregnancy that carry specific norms about pregnant embodiment and bodily management during pregnancy (The Voice Group, 2010, 2012 ; Nash, 2012). Interviewees considered digital environments as « safe spaces » that give them an opportunities to espace from normative discourses on pregnant bodies. The narrative of women highlight medical, commercial and social discourses on pregnancy are heavily structured around pregnancy a period of happiness, resistance to pain and endorsement of health behaviors for the sake of the future child. Such discourses may lead to disembodied experiences of pregnancy or shame from current bodily experiences. Online support groups offer alternative spaces where it is possible to voice and heard voices of actual bodily experiences of pregnancy that often break with those discourses on pregnancy as Angélique (32) noted and help coping with liminal state : "*No one talks about it, everyone says pregnancy is a fulfilling period, everyone is happy, it's beautiful, it's joyful. But in the end, no, the first trimester is complicated and the fact that it is quite taboo is quite hard to accept. (...) Precisely, the girls do not hesitate to share about their first trimester so they say: "I have nausea", "I went to the hospital because I had ligament pain". We are more aware that the word is free here, on the internet rather than in real life.*". To this regard, reembodiment through alternative subjectivities seem to be based on sharing and reading authentic everyday life experiences that enables a greater acceptance of a body that may seems « out of control ». Yet, alternative subjectivities forged in digital environment often coexist with exposure to targeted ads in highly emotional situations, whether positive (*e.g.* sharing of the first ultrasound, looking at photos of a child birth) or negative experiences (*e.g.* anxious waiting due an amniocentesis test, perinatal grief). Pregnant reembodiment on digital environment are structured by a tension between consumer resistance and consumer vulnerability that may be often difficult to disentangle : interviewees acknowledged an imbalance between themselves and brands (or apps) in their digital experiences considering it, most of the time reluctantly, as "the price to pay" to benefit from digital journey that help them during their pregnancy.

« Feeling pregnant » : reembodiment through digital reenactment of liminality

The ability to connect with its future child away from medical discourses and to create new bodily experiences in embracing pregnancy as a liminal journey on the app is praised by many respondents who were highly enthusiastic about the app. Despite partnerships with brands, pregnancy apps, by offering 3D pictures of the foetus are also considered, are considered as an escapism from normative and, in particular, medical discourses. Digital environments give the feeling to women to consider their bodily experiences under their own terms through digital reenactment of liminality, with no need to buy pregnancy related goods and services, nor to take a medical appointment. Lena (27) notes "*it has been a very useful mobile application, it shows the evolution of the pregnancy, without necessarily waiting for medical appointments.*". In the same vein, Adèle (19) says "*i love how the applications follow our pregnancy week after week, we feel all the more close to my baby when we know its evolution every week.*" To this regard, some women did not hesitate to compare the app with a caring close one, truer and, sometimes, more compassionate that medical staff. When asking for the reasons of such enthusiasm, the fact that the app enables to « feel » pregnant was very important. Some argue that, in their professional life and, even, in their private life that may « forget » about their pregnancy and fail to fully realize they have a baby in their belly. By creating a 9-month

experience that is difficult, if not impossible, to enact offline, digital environments enables a form of reembodiment based on the self-affirmation of its identity as a pregnant women. Yet, the « intrusion » of apps within the prenatal imaginary in an almost symbiotic manner is a double-edged sword. If it enables a sort of self-awareness of the women using such apps, it both creates a great control over women's own embodiment and disciplines the pregnant reembodiment as a triangular relationship mother-app-child. The personal stories of some interviewees reveal that reembodiment in the digital world seem particularly important for women who went through particular difficult events regarding previous pregnancies (miscarriage, child death) or experienced social vulnerability during their pregnancy (lack of social support, separation or divorce). For them, the benefits of those digital environments seem high and interviewees who experienced difficult events may be likely to be more engaged than others. At the same time, these are the ones who report feeling the most vulnerable to marketing discourses and predatory practices. How transformative consumer researchers could build on the strengths of digital technologies, alleviating potential vulnerability? By looking at the entanglement between individual characteristics, individual states, external conditions and experiences of pregnancy on consumer and market responses (The Voice Group, 2010), we uncover the role of digital environments in reshaping levels of literacies.

"Learning" consumption : pregnant women and the pursuit of higher level of literacies

Pregnancy is an unsettling experience that disrupts women' consumption routines and requires new knowledge and new skills (Sevin & Ladwein, 2008). Yet, knowledge is not always power unless individual has the ability to contextualize the knowledge she received and to produce himself meaning with the cultural settings it evolves, which is associated with high level of literacy. Literacy in participants narratives are associated with health literacy (Nielsen-Bohlman, Panzer, & Kindig, 2004), brand literacy (Bengtsson & Firat, 2006), food literacy (Colatruglio & Slater, 2014) so as with marketplace literacy (Viswanathan, Sridharan, Gau & Ritchie, 2009). Facebook groups and mobile apps are depicted by interviewees as participating in shaping their strategies to cope with feeling of powerlessness and anxiety related with changes in consumption routines and medical discourses about healthy lifestyle through increased access to information embedded into the experiences of others like them. To this regard, digital technologies may enable help to develop individual and collective strategies to build literacy capabilities regarding what food to eat, what cosmetic to use or what to put on the maternity bag. Social media support groups are also a valuable source of information to guide mothers-to-be in their consumption choices and bodily experiences as notes Marie (37) : "*It has allowed me to learn a lot from mothers who are more advanced in pregnancy than I am, or who have already had a child. I was able to anticipate a lot of things (useful and useless things to buy for example) and also learn about administrative procedures that I didn't know about. It also allowed me to realize at what stage I would start to feel baby, or what the mucous plug was etc.*" Information are not just delivered as a something to be learned but as the outcomes of contextual and personal experiences. Women's coping strategies when facing a lack of information as consumers are often a kind of « bricolage » based on prior knowledge and information found online (from one or different sources). It is worth being noted that, despite a certain attention to identify inaccurate information, the acknowledgement of mixed emotions related to the struggle with bodily experiences contribute to both contextualization and credibility of the information. Our data do not enable us to say if such credibility is related to the era of doubt

and skepticism toward institutions or if it is related the multiple opportunities for reembodiment that create a feeling of authenticity. We can only note that the over-reliance on digital technologies as a tool for personal control may endanger consumer power and well-being and even provide disembodied experiences of pregnancy as Charlotte (25) puts very simply, without considering ceasing to use pregnancy apps : "*Sometimes we rely too much on these applications instead of really experiencing our pregnancy.*". Digital opportunities for reembodiment definitely affect the balance of power between consumer and the marketplace, subverting the relationships between resistance and vulnerability. The intimacy with one's own body leads individual to bear the responsibility of their own vulnerability, despite the fact that digital reembodiment is created out of an interaction between individuals and digital technologies.

DISCUSSION

The present research adds to the academic research on consumer vulnerability and resistance during pregnancy by shedding light on the different sources of digital reembodiment in specific digital environments (Facebook groups of mothers-to-be and mobile apps) structured by an inner tension between consumer resistance and consumer vulnerability that makes them often difficult to properly disentangle. Digital environments are perceived as ways for mothers-to-be to renegotiate their bodily experiences during this transition phase by escaping normative discourses on pregnancy, by « feeling » their pregnant body and by learning how to be a literate consumer in caring about themselves and their future child. The present framework of sources of reembodiment offers a promising area for future research to further explore power balance between mothers-to-be and market actors in digital environments and associated coping strategies, through a close attention to bodily experiences at the intersection between resistance and vulnerability. To this regard, the Mobius strip metaphor is useful to conceptualize the multiplicity of these bodily experiences, their entanglement and their importance for consumer's self. These findings further validate the notion of « *proteus effect* » (Belk, 2013) as one of the major consequence of reembodiment (*i.e.* the ability of online experiences to impact offline experiences), which is not without consequences in terms of consumer resistance, nor vulnerability. Some limitations should be underlined. Pregnant women were only interviewed once and methods such as projective techniques (The Voice Group, 2012) or participatory research techniques (Crockett, 2013) would have provided further information on the investigated topic. Future researche could develop innovative data collection adapted to investigate power balance between consumers and market actors in online settings as it may help to gain greater insight on consumer resistance, vulnerability and strategies to advance their own well-being. With regard to the topic of reembodiment in digital environments, a fruitful dialogue between consumer research and nursing research (Lupton, 2016) could advance academic knowledge of the transformative potential of digital environments for the well-being of mothers-to-be. By enhancing the need to take into account the experiences of pregnancy in online environments, this paper calls for more respectful online marketing practices that do not play on factors of vulnerability and actually align with pregnacy-related market actors rhetoric that are structured around an attention to well-being of mothers-to-be.

Table 1. Sources of Reembodiment in Online Experiences of Pregnancy.
SUMMARY TABLE

Sources of reembodiment	*Escaping normative discourses on pregnant bodies*	*Opportunities for increased literacies*	*Digital reenactment of liminality*
Consumer resistance practices	• Healing power of reading and writing bodily experiences in women' own terms shared online. • Feeling of empowerment resulting from digital storytelling and access to alternative bodily subjectivities.	• Rebuilding literacy capabilities through increased access to information. • Sharing and coping with feeling of powerlessness and anxiety related with changes in consumption routines and medical discourses about healthy lifestyle.	• Ability to connect with its future child away from medical discourses. Pregnancy-related mobile apps are considered as a tool to be connected with one's own baby without having to rely on medical appointments. • Creation of new bodily experiences of pregnancy that forges digital forms of liminality.
Factors of consumer vulnerability	• Simultaneous exposure to pregnancy advertising and to narratives of intense affective experiences whether positive (e.g birth) or negative (e.g perinatal grief). • Personal histories of women show that reembodiment in the digital world seem particularly important for women who went through particular difficult events regarding previous pregnancies (miscarriage, child death) or experienced social vulnerability during their pregnancy (lack of social support, separation or divorce)	• Consumer anxiety due to imbalances between consumers and the marketplace and a sense of powerlessness arising from individual-environment interactions. • Over-reliance on digital technologies as a tool for personal control may endanger personal power and well-being and create disembodied experiences of pregnancy. Pregnancy-related mobile apps and online support groups may be detrimental to appropriation of bodily experiences in shifting women's concerns away from their self to only focus on information.	• Exposure to marketing stimuli in highly emotional situations that may unconsciously affect consumers' choices. • « Intrusion » of digital technologies within the prenatal imaginary.

Consumer Creativity: Materializing the Moleskine Notebook in Digital Space

Christiane Aufschnaiter, MCI The Entrepreneurial School, Austria

INTRODUCTION

In a time where digital technologies have entered almost every sphere of consumers' everyday life, consumer researchers are observing a re-emergence of analogue consumption objects such as vinyl, Polaroid cameras, or paper notebooks (Bartmanski and Woodward 2015; Humayun and Belk 2020; Minniti 2016; Sax 2016). Some findings reveal symbolic aspects of these forms of retro-consumption and consumers' nostalgic desires (Alexis 2017; Reynolds 2011; Sax 2016), while others focus on consumers' need to disconnect from the digital (Humayun and Belk 2020; Thorén et al. 2019). Recent studies highlight that a sharp delineation of the physical and the digital (Jurgenson 2012), or offline and online identities (Šimůnková 2019) is no longer possible. The boundaries are blurring and "no one lives an entirely digital life and [...] no digital media or technology exists outside of networks that include analogue and other media technologies" (Horst and Miller 2012, 16). Thus, studies of analogue consumption objects should not be limited to physical space but include processes that take place across digital and physical space (Magaudda and Minniti 2019)in short, ?retromedia?.

This study focuses on the Moleskine paper notebook, an object that was originally deeply rooted in physical space both as an object and regarding its associated practices such as writing or drawing. Today, Moleskine successfully combines the myth of its origins with the positioning as a brand that accompanies contemporary creative nomads with digital and analogue tools (Humayun and Belk 2020; Moleskine 2019). This paper explores digital traces of consumers' ways of using and relating to the Moleskine notebook on Twitter. Prior research on the Moleskine notebook has either focused on contrasting the use of an analogue object and a digital alternative (Humayun and Belk 2020) or on writing practices in physical space (Alexis 2017). By following the Moleskine notebook into the digital space, this study aims to investigate how consumers integrate an analogue object into their everyday life across digital and physical space. Drawing on theories of consumer creativity and materiality, this study examines not only symbolic and discursive aspects of these forms of consumption but links them with material aspects and related creative practices. The findings reveal three creative practices that show how consumers materialize an analogue object that seemed to be outdated and obsolete in the digital era.

THEORY

Consumer creativity

The imperative to be creative, the so-called creativity dispositif, is currently reshaping and restructuring society as a whole and consumption specifically (Reckwitz 2017). As a response to the lack of affect in modernity, creative practices that have previously been specific to the artistic field have now spread throughout society and the economy. The internet enables consumers to expose themselves to and express their creativity. As a platform for creative works, it facilitates the circulation of "everyday creative products" (Literat 2019, 1169). Furthermore, digital platforms and online communities enable consumers' collective creativity (Kozinets, Hemetsberger, and Schau 2008) as they "trigger new interpretations and new discoveries" (Kozinets et al. 2008, 341) in a dynamic process of combining "self- and collectively sustained curiosity and drive" (Kozinets et al. 2008, 351).

This study builds on these understandings of creative consumers as active agents in an ongoing process of innovating consumption objects and related practices (Shove and Pantzar 2005)it is not enough to show that goods are symbolically and materially positioned, mediated and filtered through existing cultures and conventions. Twisting the problem around, the further challenge is to explain how practices change and with what consequence for the forms of consumption they entail. In this article, we suggest that new practices like Nordic walking, a form of 'speed walking' with two sticks, arise through the active and ongoing integration of images, artifacts and forms of competence, a process in which both consumers and producers are involved. While it makes sense to see Nordic walking as a situated social practice, such a view makes it difficult to explain its growing popularity in countries as varied as Japan, Norway and the USA. In addressing this issue, we conclude that practices and associated cultures of consumption are always 'homegrown'. Necessary and sometimes novel ingredients (including images and artifacts. The study extends these perspectives by linking consumer creativity with theories of materiality and focusing on the consumption object as an element that shapes and is shaped by consumers.

Materiality & consumer-object relations

The role of objects in shaping consumers' identities has been studied extensively in consumer research (Ahuvia 2005; Belk 1989; Csikszentmihalyi and Rochberg-Halton 1981; Wallendorf and Arnould 1988; Woodward 2011). More specifically, scholars have focused on the material aspects of consumer-object relations to account for the co-constitutive and co-creative relationship between objects and consumers (Bartmanski and Woodward 2015; Borgerson 2005, 2013; Mardon and Belk 2018; Miller 2005, 2008). In a process of objectification, consumers rework objects to support their identity projects and thus, are transformed by the objects themselves (Ferreira and Scaraboto 2016; Miller 2005).

Following new materialism, consumption objects should not be viewed as fixed and finished entities but as constantly evolving and in a state of becoming (Ingold 2012). The material substance of objects is an important element in the consumer-object relation and should be seen as a potential "for further making, growth, and transformation" (Ingold 2012, 435). Thus, the materiality of objects shapes the ways in which objects can be used as it invites or discourages certain behaviors (Mardon and Belk 2018). Theories of materiality and consumer-object relations offer a theoretical lens that allows a deeper understanding of consumers' "culturally situated material interactions" (Ferreira and Scaraboto 2016, 192) with the Moleskine notebook.

METHODOLOGY

This study uses a netnographic approach (Kozinets 2020). The author observed and participated in Moleskine consumers' conversations on social media platforms (Facebook, Reddit, Twitter) for six months to gain insights into what people talk about, how they use, and how they integrate the paper notebook into the digital space. Data collection was narrowed down to Twitter, as a first exploratory analysis has revealed a large variety of practices on this platform. 1,682 tweets were collected via the Netlytic app (keyword Moleskine, language English) in January and February 2020. After excluding retweets, tweets that were not related to the Moleskine notebook brand, promotional content, and content that was not generated by

consumers, 738 (self-)expressive tweets were classified according to the Moleskine product category they refer to: *paper notebooks/planners, digital devices/apps, pens/pencils, bags/accessories,* or *others.* The subsequent qualitative analysis focuses on the 570 tweets that show or mention the product category *paper notebooks/planners.* Data includes consumer-generated text and images. Tweets were analyzed in an iterative process of inductive categorization and abstraction (Marwick 2014; Spiggle 1994). Images were analyzed using critical visual content analysis techniques (Rose 2012).

FINDINGS

The author identified three recurrent practices that show how consumers express their use of and relation with the Moleskine notebook on Twitter. In the following, these practices are described in detail (Table 1).

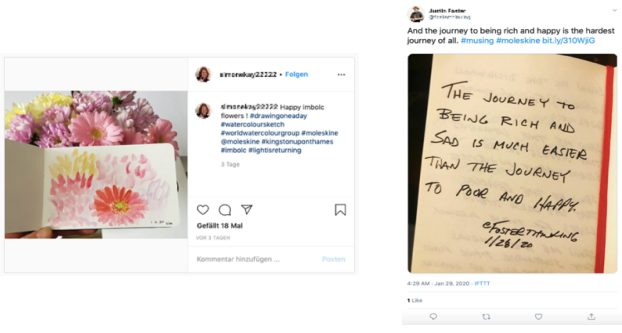
Nourishing an image of the creative self through making analogue practices visible in digital space

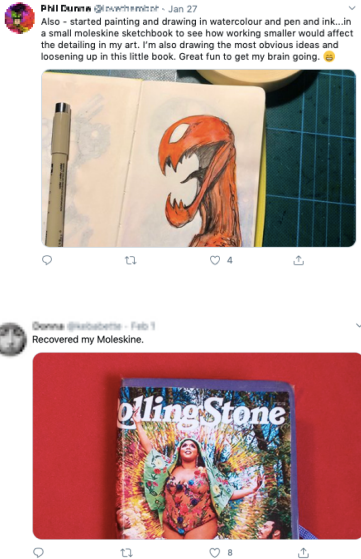
The analysis reveals that the Moleskine notebook enters the digital space in the reproduced form of a digital image (Minniti 2016; Neef and van Dijck 2011) as consumers share images of their creative works on Twitter. This act of displaying is a communicative strategy that "delivers the personal to the public" (Noy 2019, 3). There is little interaction among consumers and posts often include a URL to images on Instagram, where the purpose of the tweets is to frame the images (Noy 2019) and increase their visibility (Arvidsson and Caliandro 2016; Marwick 2014).

Some images depict analogue creative works such as drawings, paintings, or handwritten texts without any other material elements. In these cases it is impossible to tell whether consumers indeed use a Moleskine notebook or only mention the Moleskine brand as a vehicle for publicity (Arvidsson and Caliandro 2016). However, most images also depict additional material elements that are involved in analogue practices of producing creative works. These images reveal various strategies how consumers "transform digital reproductions into meaningful carriers of analogue practice[s]" (Minniti 2016, 37) and make these otherwise rather private, creative practices visible in digital space: Consumers explicitly show the Moleskine notebook and highlight its distinctive characteristics such as the rounded corners or the elastic page-holder. Images focus on the material substance of the paper or include other material elements such as pens or body parts, mostly the hand. Furthermore, images are placed in the environment where they were drawn, showing, for instance, a desk or the original motif of the drawing. Digital post-processing such as applying filters or adding digital text is limited. Thus, consumers emphasize the "analogue experience" (Minniti 2016, 37) and materiality of digital images in order to authentically present themselves and their creativity online.

Deriving meaning from expanding the creative use of the notebook

Furthermore, the findings show that consumers use Twitter as a platform to discuss their ways of using the Moleskine notebook with other consumers. They collectively enhance their creative skills, integrate new material elements, and thus establish new ways of using the Moleskine notebook in both digital and physical space. Consumers derive enjoyment from skillful engagement with objects (Csikszentmihalyi and Rochberg-Halton 1981; Watson and Shove 2008). As the case of the Moleskine notebook shows, engagement with an analogue object is not limited to physical space but extended to digital space. Consumers discuss how the material affordances of the notebook, that is its material surface, its fillability, its mobility, and

the related aura of authenticity (Noy 2019), structure their creative practices. These affordances can either enhance or limit consumers' ways of using the notebook, as the following examples show: *"beyond excited to start filling in my new @moleskine wonder how fast I can finish this one !!"; "You're going to laugh at me, but I've used Moleskine notebooks for 20+ years even though my favorite pens bleed through the pages."*




The creative use of the notebook involves the active integration of material elements and skills (Shove and Pantzar 2005). Consumers develop relevant skills not only through physical engagement with the notebook but also through seeking advice from other consumers and drawing inspiration from their ways of using the Moleskine notebook on Twitter. Consumers describe their creative practices and the involved objects in detail. Some practices relate to the main functional purpose of notebooks such as writing, note-taking, drawing, painting, sketching, or journaling, while others are more innovative such as transferring analogue content to a digital form. Other practices highlight how consumer invest symbolic meaning in their notebooks by engaging in rituals such as customizing the cover or collecting notebooks (McCracken 1986; Wallendorf and Arnould 1988; Woodward 2012). Further objects involved in these rituals are, for instance, writing tools such as pens or pencils, decorative items such as stickers or washi tapes, and also digital devices or apps. Consumers emphasize how they skillfully combine various objects and how the integration of these material elements results in creative practices in digital and physical space.

Relating to the notebook as a companion across digital and physical space

The Moleskine notebook can be seen as a transitional object (Ferreira and Scaraboto 2016; Winnicott 1971) that has the capacity to support consumers' identity projects across digital and physical space and through time. Interactions between consumers and transitional objects are "capable of producing [...] imagination, emotions and desires for self-transformation" (Ferreira and Scaraboto 2016, 195). The findings suggest that the Moleskine notebook is an object that provokes emotions as consumers express their love (*"Forever a @moleskine fan"*) or dislike (*"I'm in the embarrassing position of being totallysick of the Moleskine aesthetic"*) in emotional, affective tweets. They show their attachment by talking about "*my moleskine*" or "*my moleskine family*". Consumers assign almost human properties to the notebook and state that they could not live without the notebook: "*I've become the person who can't go a single day without their moleskine.*" Also, consumers reveal the importance of the Moleskine notebook by naming it as one of the five things they could not live without or would never leave the house without. Not having the notebook with them or losing it, makes consumers feel distressed and incomplete as if the notebook were a part of themselves (Belk 1989).

Some consumers express ambivalent feelings regarding the use of the Moleskine notebook. The material substance of the notebook, images and descriptions of other consumers' creative practices, and Moleskine's positioning as a brand that "accompanies the creative and imaginative professions of our time" (Moleskine 2019) seem to put consumers under pressure to produce aesthetic, creative works themselves. They believe that they cannot live up to these expectations and are reluctant to write into the notebook: *"I wish I was one of those artists that could fill up a sketchbook in a couple of weeks, that tells a remarkable story [...]."* As this quote suggests, the Moleskine notebook may induce a desire for the consumers' self-transformation.

Table 1: Findings – Three creative practices

Creative practices	Examples
Nourishing an image of the creative self through making analogue practices visible in digital space - Digital circulation of paintings, drawings, handwritten texts, collages or a combination - Depicting material elements involved in the analogue creative practice, emphasizing analogue experience and materiality of digital images o Making the notebook and additional writing tools visible o Showing the environment where the pictures were drawn o Limiting digital post-processing	
Deriving meaning from expanding the creative use of the notebook - Developing new ways of using the Moleskine notebook through active integration of material elements and skills o Drawing on the notebook's material affordances o Enhancing creative skills by seeking advice and drawing inspiration from other consumers o Establishing new creative practices through skillful integration of material elements	
Relating to the notebook as a companion across digital and physical space - The Moleskine notebook as transitional object that supports consumers' identity projects across digital and physical space and through time o Expressing strong attachment to and humanizing the notebook o Expressing ambivalent feelings associated with the perceived pressure to be creative	

DISCUSSION

The case of the Moleskine notebook shows that understanding the re-emergence of this analogue object only as a nostalgic return to analogue forms of consumption leaves important aspects underresearched. Instead of "escaping the digital realm through postdigital consumption" (Humayun and Belk 2020, 3), Moleskine consumers derive meaning from creatively combining digital and analogue aspects of consumption. This study contributes to our understanding of this phenomenon by focusing on the co-constitutive relationship between consumers and objects on the one hand and the digitalization of materiality in social media on the other hand. Rather than rendering the analogue notebook obsolete, digitalization plays an important role in reconfiguring the materiality of the notebook (Minniti 2016).

The study identifies three creative practices regarding consumers' use of and relation with the Moleskine notebook that can be observed on Twitter: First, consumers make their analogue creative practices visible in digital space through displaying authentic images of the notebook, creative outcomes, and related creative practices. Thus, an analogue object that used to be associated with private content (Noy 2019) is transformed into an object of public display that supports consumers in their aim for gaining attention in digital space (Arvidsson and Caliandro 2016; Eckhardt and Bardhi 2020) through conveying a favorable, and sometimes probably just desired image of a creative, artistic self. Second, consumers inspire other consumers or draw inspirations from their creative expressions on Twitter, and thus expand their use of the Moleskine notebook in digital and physical space. These innovative, creative practices concern the functional use of the notebook and, even more importantly, ways of turning a mass-produced notebook into a singularized, meaningful object with a high symbolic and emotional value for consumers (Csikszentmihalyi and Rochberg-Halton 1981; Epp and Price 2010; Kopytoff 2014). Third, the findings show how consumers refer to the notebook as a meaningful companion across digital and physical space, thus challenging literature on the vanishing importance of material objects in liquid modernity (Bardhi and Eckhardt 2017; Bardhi, Eckhardt, and Arnould 2012). On the one hand, the materiality of the Moleskine notebook gives consumers the flexibility to invest the notebook with new meanings and to use it in innovative and creative ways. On the other hand, it provides a sense of continuity and structure to consumers' lives and supports their identity projects across digital and physical space and through time.

This paper shows that in order to better understand the recent success of analogue objects such as the Moleskine notebook, future research should look at consumers' individual and collective creative practices across digital and physical space in more detail. Consumers enact these practices, and thus materialize a seemingly outdated, analogue object as a meaningful, desired object that plays an important role in both digital and physical space. The study has two main limitations. First, it focuses on one brand and data from one digital platform. Second, this study only investigates creative practices that were observed online. Thus, further research should examine consumers' creative practices evolving around other brands in both online and offline field sites.

From Aesthetic to Epistemic Consumption: Analyzing Knowledge Practices in Consumption Collectives

Jan-Hendrik Bucher, University of St. Gallen, Institute for Customer Insight, St. Gallen, Switzerland

INTRODUCTION

Inspired by consumers' current concerns with climate and health sciences, we follow the popular insight that we live in a knowledge society (Stehr 2012). This knowledge orientation even manifests in everyday consumption. Daily, consumers collectively create, legitimize, share, accumulate, and consume *epistemic knowledge*, i.e. explicit, tangible, and objective knowledge that manifests in data, facts, and information. Prior research acknowledges that knowledge is essential for collective consumption, but primarily examines a cultural conception of knowledge in a tacit sense focusing on cultural dispositions such as aesthetics or taste (cf. Kozinets, Patterson, and Ashman 2016; Maciel and Wallendorf 2016; Schau, Muñiz Jr, and Arnould 2009; Seregina and Weijo 2016). This paper explores the collective pursuit of epistemic (quasi-scientific) knowledge practices as a consumption activity. We present a comparative case study of two highly-specialized knowledge-intensive consumption collectives, game-breakers and drone racers, to show that practicing quasi-scientific knowledge can likewise drive and structure consumption collectives. Linking our findings to the rich literature on consumption collectives, we ask: *How is Epistemic Knowledge Practiced in Consumption Collectives?*

New insights into knowledge-intensive consumption collectives allow us to better understand consumption phenomena in contemporary consumer culture such as expert systems (Latour and Deighton 2018), nerd- or geek- cultures (Seregina and Weijo 2016), self-trackers (Etkin 2016; Lupton 2014), online forums and communities (Arvidsson and Caliandro 2015; Kozinets, Hemetsberger, and Schau 2008; Mathwick, Wiertz, and De Ruyter 2008; Stokburger-Sauer and Wiertz 2015; Woermann and Kirschner 2015), open-source movements (Arvidsson 2011; Hemetsberger and Reinhardt 2009; Ratto 2005), hacker cultures (Thomas 2002), fandom (Busse 2006; Kozinets 2001, 2007), and consumers communing around complex focal objects (Muniz and Schau 2005; Zwick and Dholakia 2006a, b). This literature has shown us that collective consumption is intertwined with knowledge practices and that there are no consumption collectives not pervaded by knowledge.

THEORY

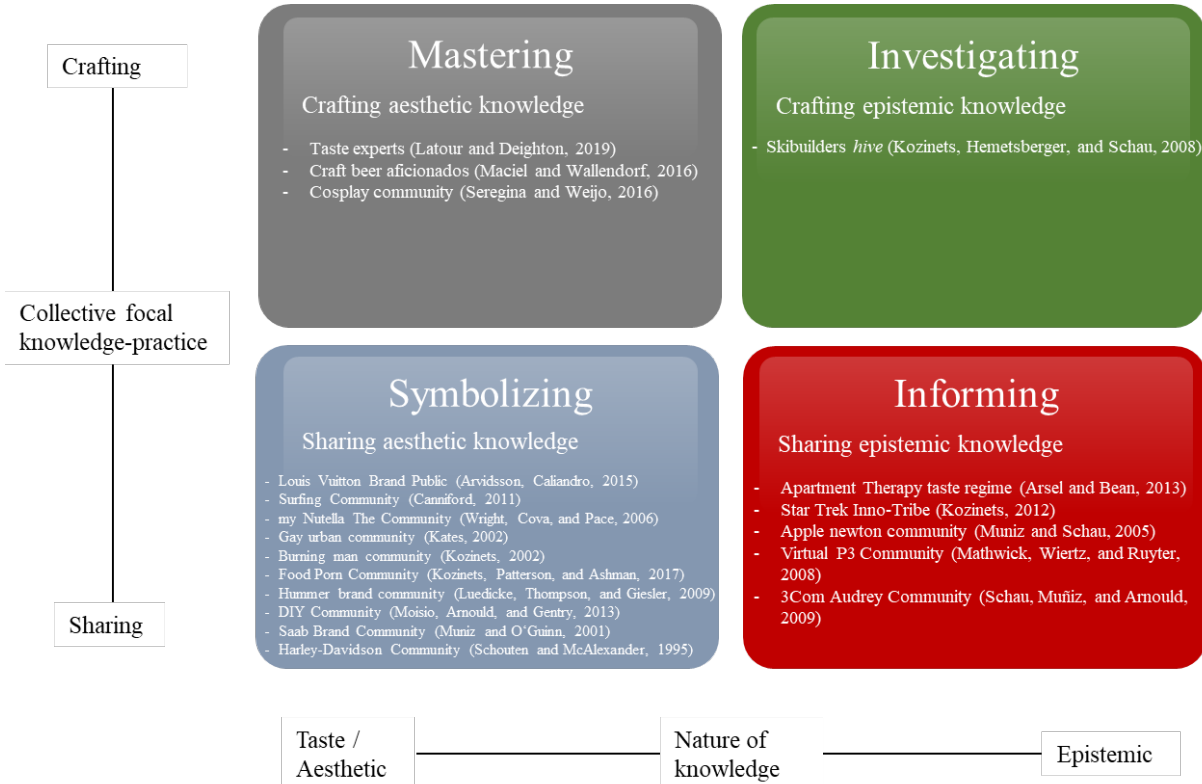
We employ a practice-theoretical analytical approach (Reckwitz 2002; Schatzki 2002) to classify focal knowledge-practices in consumption collectives. We base our classification on the distinction between tacit cultural forms of knowledge (i.e. about aesthetics or taste) versus explicit epistemic forms of knowledge, as well as on collectives focusing on sharing versus crafting knowledge. Our simplified two-dimensional view emphasizes the interplay of epistemic and aesthetic collective consumption. Our analytical classes are not intended to be entirely orthogonal or exhaustive, and neither mutually exclusive.


Figure 1: Focal knowledge-practices in consumption collectives

The two-dimensional structure yields four ideal types of focal knowledge-practices in consumption collectives: *Symbolizing*, *Informing*, *Mastering*, and *Investigating*.

We determine s*ymbolizing* as the focal practice of consumption collectives that share knowledge of taste or aesthetics. These consumers primarily engage in collective consumption to define their identity and/or to establish interpersonal relations. Here, the focal object is perceived as a carrier of (cultural) meaning symbolizing identity and status (Arnould and Thompson 2005). Consumption collectives sharing taste and/or aesthetic knowledge are studied diversely and profoundly in the rich literature strand of *Consumer Culture Theory* as most literature in this research stream falls into this broad class.

We further identified *informing* as focal knowledge-practice in certain consumption collectives. Consumers share epistemic knowledge in the form of *peer-to-peer* problem solving to build social capital (Mathwick et al. 2008) and hereby idealize the focal consumption object (Muniz and Schau 2005; Schau et al. 2009). As in the consumption collectives focusing on *symbolizing*, in this class, the object primarily serves as a carrier of meaning. However, its complexity is perceived as high due to the epistemic character of tangible knowledge that consumption with the object yields. Research has partially covered collective consumption phenomena whereby an analytical focus is on continuing discontinued market offerings (Kozinets 2007; Mathwick et al. 2008; Muniz and Schau 2005; Schau et al. 2009).

Consumption collectives focusing on *mastering* practice taste or aesthetics to craft knowledge. Here, the focal objective in collective consumption is to become *connoisseurs*. Knowledge is generated through the endeavor of reaching or approaching *mastery*. As with consumption collectives focusing on *symbolizing,* knowledge is defined in a Wittgensteinian sense of (sub)cultural competence (Schatzki, 1996; Warde, 2005) and thus of a tacit nature. The focal object is perceived as a complex carrier of information that can be analyzed and interpreted. Most research in this field explicitly focuses on taste (of high-class beverages) yet (Latour and Deighton 2018; Maciel and Wallendorf 2016).

Finally, we identify consumption collectives that craft explicit epistemic knowledge with the focal objective of *investigating*. Consumption collectives in this class unite around a focal knowledge project that is complex enough to generate questions and to be unfolded and explored (almost) indefinitely. Consumers enjoy the intellectual challenge of collectively and creatively exploring complex (technical) consumption objects to overcome limitations and to achieve novel and clever outcomes. Thus, as opposed to the other classes, we define the collective innovation orientation in terms of crafting *new* knowledge as high. Compared to consumption collectives interested in *symbolizing* or *mastering*, taste and aesthetics are rather unimportant for these consumption collectives. Since *investigating* is the focal practice in these consumption collectives the structuring forces of knowledge are exceptionally high.

Having organized focal knowledge-practices in consumption collectives, we conclude that knowledge practices decisively shape collective consumption. We see that collective consumption is intertwined with knowledge and that there are no consumption collectives not pervaded by knowledge practices. However, most research focuses on knowledge in a Bourdieuian sense of accumulable field-specific disposition (Bourdieu 1984) or in a Wittgensteinian sense of (sub)cultural competence (Schatzki 1996; Warde 2005) (as it is the case with consumption collectives interested in *symbolizing* and *mastering*). Inspired by consumption collectives crafting epistemic knowledge we spot a research gap. With this study we propose an analytical *knowledge-based* approach to studying, categorizing, and understanding knowledge-intensive consumption collectives.

CONTEXTS

To study the focal knowledge practice of crafting epistemic knowledge in consumption collectives, we comparatively analyze two highly-specialized knowledge-intensive consumption collectives where epistemic practices are vividly exposed.

First, we studied drone racing, a competitive team sport notable for its demand for engineering skills, scientific understanding, and highly-intense adrenalin-drenched races at the intersection of e-sports and real-live racing. Drone racing or 'FPV' (first-person view) racing is one of the "fastest-growing sports in the world" (Stock 2015) where pilots control their small quadcopters remotely while wearing goggles which display the video signal from a small camera mounted to the drone in real-time. In races, up to ten pilots compete against each other. The race track is usually built out of various kinds of gates which the drones have to pass reaching speeds up to 130 km/h (Rohe 2017). Crafting and advancing the racing drone is not only directly linked to a competitive advantage in races but also a crucial step in legitimizing oneself as a member. As practitioners research, tinker, test, and experiment, community-specific knowledge is created, bundled, and shared. Ultimately, much more time, energy and resources are invested in crafting drones as compared to racing them.

Second, we studied game-breaking, a highly demanding activity of crafting understanding of games through collaborative quasi-scientific processes with the goal of optimizing for speed, minimum number of a-button presses, or the like. What they all have in common is that they do not operate within the logic of the game intended by the designers, but follow their own arbitrary rules. Therefore, we define game-breaking as a metagame, a game of optimization that transcends outside of the prescribed intentions of the video game. *Game-breakers* are well-connected and engaged technology enthusiasts who are keen to experiment. They enjoy the intellectual challenge of creatively exploring the game to overcome limitations and to optimize playthroughs. To reach their goal of optimization they collectively, dedicatedly, patiently, and persistently engage in, sometimes painstaking, quasi-scientific processes for hundreds over hundreds of hours of exploring, analyzing, and deconstructing the focal object. To craft understanding, game-breakers commonly figure out how games are programmed to reverse-engineer them and break them apart aiming to solve the *puzzle* of finding the most optimal way to *beat* it. Game-breaking exists since video games have been around. However, once an underground hobby conducted by video-game players exchanging footage through obscure internet forums, since 2010 it has become an ever more rapidly growing global phenomenon, having occupied a significant place within game culture, reaching broader public attention, and even influencing the multi-billion dollar video game industry (Escobar-Lamanna 2019; Ford 2018; Lewis 2020; Scully-Blaker 2016; Warman 2019). Worldwide, game-breakers actively discuss in forums and via livestreaming platforms and stream and upload videos, with the most popular videos viewed tens of millions of times.

EMPIRICAL APPROACH

We conducted a comparative case analysis to discern similarities and differences of context-specific knowledge practices to develop our key theoretical themes with coherence and consistency.

In the fall of 2017, we joined a racing drone collective where we conducted a two-year multi-sited ethnographic study (Belk, Fischer, and Kozinets 2013) including participant observations on many

different occasions like test sessions, building meetings, race practices, social gatherings, and competitions. Additionally, throughout the project, we derived a multi-sited netnography (Kozinets 2009) from publicly available user-generated content (e.g., posts of various kind in social networks like *Facebook* or *Instagram*, on discussion boards, on blogs, and on *YouTube*), as well as from content published in (semi-)private contexts like closed Facebook groups, closed Instagram profiles, or private messages.

Additionally, we followed game-breakers for two years online as well as on fairs, resulting in numerous hours of netnographic investigation, as well as in ten ethnographic interviews and eight recorded in-depth interviews. Since knowledge practices are hidden in socio-structural characteristics of both consumption collectives, we combined various methods such as ethnography, netnography, in-depth interviews, ethnographic interviews, photo, video, and audio recording in natural settings that can be used for an in-depth analysis of practices around knowledge (Canniford and Shankar 2013; Gobo 2008; Valtonen, Markuksela, and Moisander 2010).

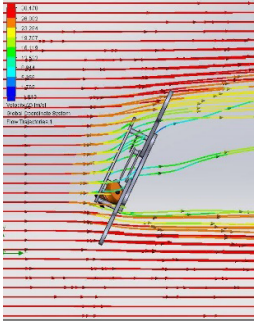
FINDINGS

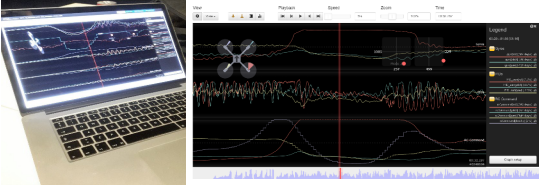
Building on Lévi-Strauss' (1966) pioneering analysis of human (problem-solving) thinking, we emphasizing the collective (questioning) mindset "that uses knowledge, experimentation, and speculation to solve problems and reach goals" (Maciel and Wallendorf 2016) in consumption collectives. Hereby, we find that the consumption collectives we studied craft, legitimize, archive, and disseminate knowledge. Our data show that drone racers and game-breakers use epistemic knowledge (e.g. in the form of complex formulas or advanced theoretical understanding), epistemic practices (such as conducting controlled tests and/or experiments), and epistemic tools (such as simulation software or data analysis programs). Engaged in an enduring cycle of theorization/hypothesizing and testing/experimenting drone racers and game-breakers successively unfold the focal object and gain explicit knowledge (Zwick and Dholakia 2006a, b), which is incorporated back into the local respectively the global collective. Hereby, a finely-meshed network of circulating knowledge flows evolves.

Although we define both as epistemic consumption collectives, they are fundamentally different. Both have in common that they center around a knowledge project. Further, the focal knowledge project is never ultimately finished but remains in a permanent *beta*-state in the constant process of becoming a future aspiration (Zwick and Dholakia 2006a, b). However, both collectives differ in structure. Even though racing drone pilots inform themselves online and engage in online communities, they primarily practice epistemic knowledge offline in their local community. Their *knowledge system* is rather closed as they maintain crafted knowledge within the community and only share knowledge which is of a general nature and does not directly lead to competitive advantage. In contrast, game-breakers primarily engage online with the worldwide community. In this open knowledge system, game-breakers share (almost) all acquired knowledge publicly, including specialized cutting-edge knowledge. In other words: While drone racing collectives have sealed knowledge systems operating in parallel, game-breaking collectives constitute one common unrestricted open knowledge system. Due to the nature of the knowledge system, the focal knowledge project is discrete in racing drone collectives while it is joint in game-breaking collectives. Further, we find that drone racing pilots engineer the drone by adding, changing or manipulating components, while game-breakers reverse-engineer the focal game by breaking and unfolding it. In both approaches to crafting epistemic knowledge weak-points are identified as starting points for further

investigation. However, while drone racers identify weak-points by evaluating them against the background of the current technological possibilities and aspire to diminish them, game-breakers try to further expose and exploit them[1]. To advance their focal knowledge project drone racers are partially dependent on the market (i.e. they wait for better batteries to be developed). In contrast, game-breakers are independent of the market as they work against market development.

CONCLUDING DISCUSSION

Consumption in game-breaking and drone racing collectives is fueled by epistemic knowledge. We extend the state of research as we identify crafting epistemic knowledge as focal practice for certain consumption collectives. Hereby, we learn (1) how individuals communize[2] around knowledge-intensive domains provoking complex consumption activities, and (2) how the epistemic dimension of consumption decisively shapes collective consumption practices. By focusing on knowledge practices in the epistemic sense (Knorr Cetina 1999) we contribute to the analysis of *know-how* (Maciel and Wallendorf 2016; Seregina and Weijo 2016), of consumption knowledge (experiential expertise) (Clarkson, Janiszewski, and Cinelli 2012), and of tacit knowledge (Arsel and Bean 2012) in consumption collectives. We uncover that consumers craft *epistemic knowledge* in quasi-scientific ways internally in consumption collectives. Building on the vast literature strand interested in consumption collectives focusing on sharing a tacit cultural form of knowledge (i.e. about aesthetics or taste) we show that consumption collectives focusing on crafting epistemic knowledge do not only practice knowledge for building social status (c.f. Kozinets 2001; Schouten and McAlexander 1995), for establishing interpersonal relations (c.f. Cova 1997, 1999), or for defining their identity (Arnould and Thompson 2005) but that crafting epistemic knowledge itself (at least partially) guides their passion.


To acknowledge this accelerating consumer movement, we propose studying consumption collectives practicing (epistemic) knowledge. Our data show that knowledge-intensive consumption collectives decisively challenge the market as they shape and co-create market offerings through developing, improving, or breaking the focal object or project and thereby continuously push the market boundaries. Through joining individual expertise and engaging in epistemic practices of crafting understanding, a finely-meshed network of circulating knowledge flows evolves. The goal of collective consumption is to continuously improve understanding of a focal consumption object at the hub of the community.


This study sheds light on (epistemic) knowledge practices in consumption collectives. In this way, we contribute to a better understanding of consumption in today's knowledge society, where collectively produced epistemic knowledge constitutes a basis for certain consumption practices. Furthermore, by understanding how consumers engage with epistemic knowledge we shed light on some of the current challenges of a knowledge society in which conspiracy theorists such as vaccination opponents or deniers of the climate change collectively produce *their own* knowledge just as quasi-scientifically as drone racers and game-breakers.

---

1   Game-breakers refer to these weak-points as bugs, glitches, or exploits.

DATA TABLE

Knowledge-Practices	Drone Racing Illustrative Data	Game-Breaking Illustrative Data
Continuously striving towards a future aspiration	- "you can almost always improve, I guess that's also what is very exciting." (Interview, Informant 12, 1:01:50) - "You will never be done with improving the drone. It's always about improving the drone a little bit every day." (Ethnographic Interview, Informant 10, 01.03.2018)	- "I like to continue striving towards that theoretical perfect time, even though it's not going to happen, but that you feel motivated because I know I can always continue working towards it. I'm only going to get closer to it over time." (Interview, Informant 2, 1:10:15) - "I enjoy seeing like, how far you can exploit a game. Yeah, seeing like, what the absolute limit for a game speed run is." (Interview, Informant 1, 12:20)
Theory crafting / Hypothesizing	- "In his design process, Informant 10 optimizes the drone as much as possible by the aid of digital simulations and hopes that they are as close to the reality as possible and then constructs the drone and flies it outside." (Fiednotes, 07.04.2018)	- "Theory crafting is where you're coming up with possible ideas for shortcuts or glitches." (Interview, Informant 2, 31:42) - "I usually have a theory that could work and then I just try it out using different methods […] then you first look at 'okay is it theoretically feasible?' you look at 'okay what do I have available at that time?' and then of course you analyze what you can do with your available tools." (Interview, Informant 7, 21:33) - "we said 'okay, theoretically this can happen'. So I ended up being the person executing their idea." (Interview, Informant 2, 29:23)
Accumulating Knowledge	- "of course, there's always the ones who are a bit further than the others so that's there's different levels of experience and then you often go to the one with more experience of course if you have a problem you want to solve" (Interview, Informant 14, 40:58) - "these hobby message boards are really useful as well you can also just google stuff or find *YouTube* videos about […] DIY drones" (Interview, Informant 8, 09:10)	"I've been doing this every day actually; I go on *YouTube* and type in *spider reignited trilogy* [name of the game] glitch and I select for the last 24 hours every single video and watch them," (Interview, Informant 3, 40:25)
Sharing Knowledge	- "Helping others is part of the culture within drone communities" (Ethnographic interview, Informant 10, 07.04.2018) - "A lot of the things we share in the local community is also just the ideas and the new things like […] finding a new way of doing something" (Interview, Informant 12, 47:11) - "I guess […] we're kind of, eh among the pros in the […] very narrow areas and that's basically where we than think 'ok I can actually post something here' because we can actually help people." (Interview, Informant 14, 32:42)	"If I find something, I'll upload it within the next 10 to 15 minutes." (Interview, Informant 5, 16:34)
Experimenting / Testing	- "you have to go outside and then you find out 'oh it doesn't work' I go in again I find out 'oh it's because I haven't soldered this' or whatever and then you go out again it's a lot of going back and forth within experimenting." (Interview, Informant 16, 73:38) - "mostly testing in the hobby is pretty primitive so mostly […] you replace the component on your copter and fly and then see I it gets better or worse." (Interview, Informant 14, 09:40) - "He [Informant 11] stated that crashes are an important part of each experiment." (Fieldnotes, 07.04.2018)	"Basically all the programming behind the game is like the rules of the game, but you don't really […] see that. So all you have is the result […] if you press A Mario jumps, you see that. So by inferring, like by experimenting within the game, you find out about the rules of the game, and you sort of figure out how it works." (Interview, Informant 3, 39:16) "After mapping the wall collisions, I was like: 'Oh, so if I did this right, then this corner should have this open openness with the collision. So Mario should be able to go closer than normal.' So then I believe in the game I went at that point, I found out that yes, that was true." (Interview, Informant 2, 1:00:10)"

Analyzing Data	- Digital data can be gathered by a processor in the flight controller and extracted and analyzed by using an open-source software called *Betaflight*. Among others, this software provides information about the speed and acceleration of the drone, motor temperature, and the voltage consumption - "Informant 10 summarized this crash with the sentence: 'There is no bad data.'" (Fieldnotes, 07.04.2018) 	For the analysis, frame-specific data regarding the position in space, the memory cache, Mario's speed per frame, and much more information is displayed.
Investigating collectively	- "Building a drone is not a one-man project, it really isn't. It's collective." (Ethnographic Interview, Informant 10, 01.03.2018) - "All the different backgrounds from the individual members are really important to build the 'perfect drone'. Some have very advanced knowledge in electronics, some in software design and others, like Informant 11, have a really good feeling for the drone so they can help to calibrate it in the end." (Ethnographic Interview, Informant 10, 01.03.2018) - "Building a drone demands so much knowledge in so many fields, no one could ever do that without help." (Ethnographic Interview, Informant 13, 07.04.2018)	- "A community really makes it easier to collect things and crack theory accordingly because there might be one person who is strong in one element e.g. in doing the tricks […], others can craft theory so well that it makes sense to try these tricks" (Interview, Informant 7, 27:19) - "*Mario Kart Wii* is a good example, because I'm not the only person working on that game. We have a specific server on *Discord* where it's a bunch of different people collaborating. […] it's a team effort to try to push the game to its limits." (Interview, Informant 2, 11:28) - "you'll hear people are playing to improve the time for the community" (Abney317 in: Snyder (2017)) - "I would [...] like to thank [name of the game-breaker] for his continued work in glitch-hunting this game, [name of the game-breaker] for his work in reverse-engineering a sizeable skip in the middle of the Prologue and [name of the game-breaker] and [name of the game-breaker] for their work in RNG manipulation and reverse-engineering certain battle mechanics." (*YouTube*-video[1] uploaded by Informant 2, 00:50)
Advancing the state of knowledge	- "It is this evolvement of the drone what the hobby is actually about. Most people from outside only see the races on the racetrack, but the real race takes place in developing the drone." (Ethnographic Interview, Informant 10, 05.05.2018) - "Informant 11 proudly stated that he and Informant 10 are doing things that are not 'out there right now'." (Fieldnotes, 01.03.2018)	- "after mapping the wall collisions, I was like: 'Oh, so if I did this right, then this corner should have this […] openness with the collision.' So then […] I went at that point, I found out that 'yes, that was true'. So like experimentally, verifying what you find, in theory, is exactly like the same satisfaction that scientists get when they're like: 'all right, if I apply these formulas correctly, there should be a black hole there.' And then they find it. It's like, amazing. […] You learn about the rules, you apply them, you make a model, you test it experimentally and if it works exactly that that's like the perfect feeling." (Interview, Informant 1, 1:00:10) - "Games are systems, and sometimes the creators of those systems do not envision all it is possible within the system, we find ways to do things that no one knows they are possible." *Narcissa Wright* in Wagner (2019)

Identifying weak-points	"Since the drone is already that much developed there are no major things where he can safe weight anymore. That is why informant 11 claims that he has to 'go on the hunt for grams." (Fieldnotes, 05.05.2018)

Understanding Identity Transformation Through Cultural Product Consumption

Chooi Ling Chong, Monash University, Malaysia
Vicki Janine Little, Monash University, Malaysia
Vimala Kunchamboo, Monash University, Malaysia
Christina Kwai Choi Lee, Federation University, Australia

INTRODUCTION

The internet facilitates dissemination of cultural products. For example, Korean popular music (K-pop) has become a global phenomenon. In 2012, Psy's "Gangnam Style" became the first music video to achieve one billion views on YouTube, and now K-pop permeates global music markets. In 2019, Korean boy-band BTS ranked seventh in the world's best-selling artists (IFPI 2020), and consumers spent $640 million on K-pop merchandise (Chang 2020). Furthermore, K-pop artists have used their global reach to promote social causes, encouraging fans to engage in online activism (Hollingsworth 2020); highlighting that the internet facilitates consumer interaction by alleviating language, social, and psychological barriers. Thus, in online communities, in addition to learning about and purchasing cultural products, consumers can share thoughts and feelings, develop social relationships, and find emotionally supportive, safe spaces for identity exploration with like-minded others. The online environment therefore offers new opportunities for consumer research, particularly in the area of consumer identity work.

While prior consumer research has addressed consumption-driven consumer identity transformation, focus has been limited to the offline rather than online context (Beudaert, Özçağlar-Toulouse, and Türe 2016; Castilhos and Fonseca 2016; Seo 2016). However, the internet plays a key role in consumer life journeys. Therefore, creating and consuming content online has transformative potential, enabling consumers to plan, refine, and rebuild their presentation of self (Halliday 2016; Schau and Gilly 2003). Responding to calls to focus on relationships rather than objects, and processes rather than structures (Vargo et al. 2017), this study focuses on the role of consumer engagement in identity construction online (Brodie et al. 2013). Our purpose is to provide a process-based and relational view of identity evolution, showing how online engagement supports development of self-concept. Additionally, as current understandings of identity construction are based on more utilitarian products, we argue that cultural products provide a unique opportunity (Holbrook and Schindler 1994). Thus, the work offers new insights into consumer identity transformation at the intersection of cultural product consumption and the online world: Online communities for cultural products (OCCPs).

We contribute deeper understanding of how technology shapes consumer behavior and experiences, and extend past work focusing on a single moment of consumption (e.g., acquisition or disposition) by exploring consumption over time (Ahuvia 2005). We ask: How do online consumer identities evolve? By examining the online journey of K-pop community moderators, we find that three stages characterize online identity evolution. Our findings suggest that in the context of cultural products, online communities free consumers to construct their identities in new ways. The research contributes insight into both online engagement and the role of cultural product consumption in identity construction.

We proceed by reviewing current knowledge on offline-versus-online identity transformation, then describe our netnographic study of K-pop communities. Next, we present findings, conclusions, and implications for research.

CONSUMER IDENTITIES—ON- AND OFFLINE

The relationship of consumption to consumer identity projects has long been of interest to consumer research (Sirgy 1982; Belk 1988; Arnould and Thompson 2005; Fournier 1998). Consumption is intrinsic to identity construction (Ahuvia 2005; Belk 1988); and conversely, identity is intrinsic to consumption, as consumer sense-making around identity translates into consumption acts (Oyserman 2009; Kirmani 2009). In general, consumer self-transformation and transition occurs in pursuit or avoidance of possible selves (Castilhos and Fonseca 2016). That the self is constantly under construction and that consumption acts are central to the process are an essential, and yet implicit part of consumer culture theory (McCracken 2008). For example, recent studies examine transformations through consuming higher education (Castilhos and Fonseca 2016), personalizing products (Elliot 2016), and by transitioning from enthusiast to serious hobbyist (Syrjälä 2016). Consumers are agents of their own transformation through daily practices, discourses, and negotiations with the outside world; both constrained by their historical, social, and cultural circumstances, and able to influence established structures (Cherrier and Murray 2007), particularly in online contexts where consumer-producer dichotomies are broken down. However, the literature is limited with respect to the specifics of transformation processes, particularly in the online context. It is important to address this limitation, as online contexts are now commonplace (Kozinets, Patterson, and Ashman 2016; Belk 2013), particularly for OCCPs.

Important contributions of online studies include examine self-presentation through personal websites (Schau and Gilly 2003) and shared forums such as Pinterest (McQuarrie, Miller, and Phillips 2013), the role of online activities in constituting and deriving taste regimes (Arsel and Bean 2013), reducing stigmatization (Scaraboto and Fischer 2013), and professionalizing sporting pursuits (Seo 2016). These studies suggest that online identity transformation projects can be seen as a continuous movement towards both creating a desired self (Castilhos and Fonseca 2016) through manipulating both self-presentation and the online environment. Overall, while current studies have explained the role of the digital environment on self-transformation, the transformation process itself has attracted limited attention.

The growth of the internet has played a central role in global information flows, enabling consumers to engage with OCCPs. Fans meet on online platforms to share and interact across a wide range of experiential and social functions (Hamilton and Hewer 2010), presenting an appropriate field for exploring consumer identity evolution. Fandom, the personal connection with an aspect of popular culture (Duffett 2013) promotes self-reflexivity and identity building through embeddedness with networks of supportive individuals and communities, facilitating the identity development process (Seregina and Schouten 2017). While fandom enables identity evolution, however it is not our focus in this research, as we situate consumer identity transformation within the larger context of OCCPs.

METHODOLOGY

This study focuses on the evolutionary process of identity construction online, in the context of OCCPs. We employ netnography, relocating the ethnographic field in digital space (Kozinets 2002);

focusing on naturalistic, unprompted individual perspectives; and revealing social phenomena from participants' points of view (Rageh, Melewar, and Woodside 2013). We selected two online K-pop communities, based on traffic density and data richness criteria (Kozinets 2015). Both have high traffic (>30 simultaneous users) and diversity of users (>30 countries).

Our key informants were community moderators (i.e., volunteers who govern online communities by encouraging participation and by coordinating and controlling member interaction). As moderators are consistent posters, we could back-track to the point where they joined the community. All moderators were women. Of all moderators in each community (total 21), we selected six (28%) against two criteria: more than two years of community experience, and more than one year of moderating experience (see Table 1).

Data analysis followed six steps (Potter and Wetherell 1987; Gill 2010): (1) download texts (17,501 comments and 1,495 pages of data); (2) read and re-read; (3) initial coding; (4) analyze regularity and variability; (5) axial coding; (6) develop categories and themes; and (7) reliability and validity checking. The first cycle of coding was conducted in NVivo, extracting and highlighting the actual language used in the data (Saldaña 2013). Axial coding categorized the initial codes according to their similarities. To ensure validity and

reliability, we looked for general coherence and negative cases (Gill 2010). Kozinets (2015) ethical guidelines were followed.

HOW DO ONLINE IDENTITIES EVOLVE?

In view of space constraints, we selected the most evocative identity evolution story: 'Joy'. Although the following themes were derived from Joy, we provide relevant examples from other moderators. Joy joined the EXO Reddit community on November 8, 2013 and now leads the moderating team. EXO is a nine-member boy band, formed in 2012. The EXO community is highly regulated and hence demanding of its moderators. Joy's online identity evolution from lurker to community cultivator followed a three-phase process: construction and alignment, transformation, and reconstruction and reinforcement.

Desired and Undesired Selves–Stigmatization

Consumers align consumption practices with their desired and undesired selves, seeking positive, and avoiding negative symbolic meanings, respectively (Karanika and Hogg 2010; Dholakia, Bagozzi, and Pearo 2004). Stigmatization of popular culture consumption has a long history, associated with low-status, immaturity, and poor taste (Fiske 2011). Perhaps because of that, our findings

Table 1: Participant profiles (attributes are deduced unless stated otherwise)

Pseudonym	Reddit Community	Age (2019)	Country of residence/ ethnicity	# years in community	# years as moderator	Data (at 12/19)		Occupation
						# posts	# pages	
Joy	EXO (15,992 members)	28	Canada	3y 10m	11m	1,383	91	Graphic designer
				2y 3m	2y 2m	2,416	178	
Xandria		25	US/ Vietnam	3y 2m	2y 2m	1,012	56	Graphic designer
Wendy		Early 20s	US/ Chinese	4y 10m	2y 2m	1,439	142	College student
Laura	BTS (102,841 members)	Mid-30s	Sweden	3y 3m	3y	6,780	563	Entrepreneur
Debbie		Mid-20s	US	4y 5m	4y 3m	1,826	193	Graduate student
Ella		24	Brazil	3y 10m	3y 3m	2,645	272	Undergraduate student
Total						**17,501**	**1,495**	

highlight the important role of OCCPs in providing consumers with an anonymous, non-judgmental, and safe space for identity experimentation:

Member: "… At first I was super secretive when watching [music videos] because my family really doesn't like K-pop …" (July 16, 2018)

Joy: "… [family] still make comments to me about it - but now I just say how I have friends all over the world, how happy I am …." (July 16, 2018)

OCCP members seek social support, friendship, and to avoid negative stigma. Socialization allows consumers to develop a sense of identification with the community (Carlson, Suter, and Brown 2008), contributing to the sense of belonging. The relational bond gives rise to positive emotions (Baumeister and Leary 1995), enhances social status of in-group members, and increases mutual trust. While some studies suggest consumers may create an idealized self in the online world (Schau and Gilly 2003), our findings suggest online identities may represent the true self as consumers identify with

each other around a shared object of consumption (i.e., the K-pop group). As participants begin to engage with the community through speech acts, they identify more closely with their online identity, conferring a virtual re-embodiment (Belk 2013). Members struggled to align their online and offline identities, feeling stigmatized by their enjoyment of popular culture. While they hid those aspects of their identity offline, they felt safe in disclosing their preferences among an aligned social group, suggesting different personas in their on- and offline worlds. They were consistent in seeking approval and positive attention, and in actively avoiding embarrassment or rejection, in order to diminish the tension between self-perception (offline 'actual' self) and who they are trying to become (ideal self).

Sense of Oneness–Tattoo

Acceptance of the self within the OCCP escalates inclusion and attachment. Supporting Schouten (1991) we found that members expressed their self-concept through communicating self-relevant information to others, highlighting oneness with the group. In particular, self-expressions through change in appearance offered a

symbolic coping mechanism to assist in role transitions. Complementing Schouten's (1991) work, we found that transformation of self-concept was supported by obtaining a tattoo. Although tattoos have been viewed as a marker of the negative stigma (Kjeldgaard and Bengtsson 2005; Larsen, Patterson, and Markham 2014) and K-pop identities are stigmatized offline, OCCP members used body tattoos to express self-concept. The images are of, EXO (1st image) and a logo from an EXO album (2nd image).

Xandria: "I would love to get line art like Yeol's tattoo style but of the tree! I love simple, thin lines on tattoos, they're my favorite!" (July 29, 2019)
Joy: "I considered actually getting the EXODUS logo on my right forearm with flowers around it to match my left forearm's tattoo." (July 31, 2019)
Body is central to identity, constructed by consuming objects and services (Belk 1988). Tattoos can be viewed as extreme modes of self-expression, extreme highly symbolic statements, riddled with meaning (Goulding et al. 2004). Mastery of the pain incurred in tattooing represents bodily ownership (Belk 1988). Our findings highlight how tattoos confer a sense of oneness and affinity with the product and between OCCP members. When individuals perceive oneness or a sense of group belonging, they internalize the norms, values, and goals of the group, motivating favorable acts toward the group, expressing group identity, and providing a means to enhance self-esteem (Hogg, Terry, and White 1995).

Exercising Self-concept–Exiting and Re-entering the Community

Identity communication acts require complex self-presentation and adjustments based on context (Goffman 1959). OCCPs enable members to express, reinvent, and reconstruct their identities, through boundary testing, withdrawal, and reentry:

Joy: "… EXO members would be so disappointed to read people saying this shit." (July 16, 2017)

Member: "I'm officially out … I've never been anything but super supportive of EXO … I thought I could have a rational discussion … you're treating me really hostilely." (July 16, 2017)

Joy: "Never was I accusing you when I said that line … you read it differently … There is not hostility coming from me." (July 16, 2017)

Member: "Please don't act like I'm just 'reading it differently.' Your paragraph literally starts addressing me specifically …" (July 16, 2017)

The next day, Joy announced her departure:

Joy: "…I have stepped back as mod … my own decision … I wanted to let you all know out of respect …" (July 17, 2017)

However, five months later she returned to the community with a new username and became leader of the moderator team – an OCCP coup:

Joy V1.0: "Hey everyone! … I would like to officially introduce you all to your new moderators … I have thought very carefully about who I wanted to join me on this team ..." (December 5, 2017)

The exchange highlights how conflict can arise when physical cues are absent. Joy felt the member's opinion was unacceptable and the member felt misunderstood. Moreover, Joy felt the member's statements attacked her ideal self, therefore she exited in order to consolidate and reconstruct her identity (Huang, Zhao, and Hu 2019), highlighting that OCCP members can create or obscure aspects of the self, and experiment with different roles and identities. After a period of crisis, she returned, presenting Joy V1.0, a new persona that disguised undesired characteristics, and magnified contributions and achievements. Through a sense of shared-self Joy V1.0 gained emotional support, reinforced member social ties (Arnett, German, and Hunt 2003), and regained her desired online identity.

CONCLUSION AND LIMITATIONS

This study sought to unfold the complex process of identity transformation in OCCPs, and to highlight the role of cultural products in identity construction. Our findings reveal three phases of identity evolution: (1) construction and alignment, (2) transformation, and (3) reconstruction and reinforcement. The contributions of this research add to existing consumer research, which has largely concentrated on identity transformation in offline. We contribute a more nuanced understanding of online identity construction in OCCPs. Participants faced crucial questions of who they were and where they belonged, in the context of K-pop content consumption. The digital environment enabled exploration, construct, and reconstruction, and in the end transformation of their personal and social identities with like-minded people.

This study has several limitations. First, pertaining to the netnographic method, we took naturally occurring data without having resource to direct responses from participants. Therefore, the authenticity of data cannot be verified. Second, we decided to focus on K-pop as a particular aspect of global consumer culture. Therefore, transferability to other contexts must be carefully considered.

Negotiating Identity and Authenticity in Hijabi Cosplay

Ofer Dekel Dachs, De Montfort University, UK
Brian Harman, De Montfort University, UK

INTRODUCTION

"Cosplay'' involves dressing up to imitate the appearance of manga or pop culture characters. "Hijabi cosplayers", (henceforth HCP) represent an interesting group within the cosplay community since they observe both Islamic dress codes and cosplay conventions (see figure 1). Positioned at the cultural intersection between fan culture and religion (Islam), HCP challenge the stereotypes of ''fan" and ''Muslim" (Gittinger, 2018).

Cosplay and its social activities provide a space for HCP to express their voices on a global stage. Moreover, cosplay provides a valuable opportunity for identity articulation that is often denied Muslim women in other areas of their lives (Schaefer and Wheeler, 2004). Since Hijab cosplay combines fandom and religion, we conceptualise a hybrid identity for cosplayers (Crome, 2019). The systems of power that construct identities may compete with each other or may complement each other during identity construction (Rein-

FIGURE 1: HIJABI COSPLAYERS IN COSTUME

hard, 2018). Our research answers recent calls in the literature (see Cleveland and Bartsch, 2019) to explore how consumers overcome the contextual tensions and conflicts that threaten the legitimacy, coherence and perceived authenticity of their identity projects (see Barnhart and Peñaloza, 2013; Fournier 1998; Holt and Thompson, 2004; Tumbat and Belk, 2011).

While conversations on authenticity are often fractious and underpinned by competing conceptual frameworks (e.g., existentialism, poststructuralism), researchers largely agree that authenticity is socially constructed. Authenticity often results from interactions and negotiations between multiple stakeholders (Peterson, 1997). Thompson, Arnould, and Giesler (2013: 76) suggest that authenticity is derived within "institutional, historical, ideological and sociological" contexts that help "situate consumers identity projects and consumption practices". Authenticity can also be gained by pursuing identity goals. For example, Beverland and Farrelly (2010) demonstrated that individuals do not assess an object's authenticity by evaluating its intrinsic properties. Rather, individual's assess authenticity by considering an object's ability to satisfy personalised identity

goals (Beverland and Farrelly, 2010). This claim is nicely illustrated by previous research which showed that individuals use meaningful music to enrich their lives (Frith and Corcoran, 1996), satisfy their personal needs and complete their identities (De Nora, 2000). In contrast, other authors (see Arnould and Thompson, 2005), suggest that the process of authenticity appropriation can only occur through co-creation with other community members (Kates, 2004; Kozinets, 2001; Schouten and McAlexander, 1995). Thus, the literature suggests that authenticity can be achieved by satisfying individual goals or communal goals. HCP seek authenticity through their costumes which satisfy both individual identity goals and communal recognition goals.

Research suggests that the pursuit of authenticity (e.g. through art) can provide meaning to people's lives (Abolhasani, Oakes and Oakes, 2017). Similarly, in seeking the preservation of their own identities, HCP resist the temptation to adopt identities that are pre-established by mainstream pop culture (Ulusoy, 2016). Therefore, adopting anime characters while observing Sharia law helps HCP retain their individual and collective religious identity. Ulusoy (2016)

explains that artistic choices assist "consumers in their quest for existential meanings' as well as providing a form of 'resistance to and emancipation from oppression" (p.252). This suggests that cosplay helps young Muslim women find meaning through understanding their place in the world. This search for meaning is facilitated through the acquisition of both an individual identity and a collective identity. The resulting communal authenticity accruing from this collective identity is a dimension of existential authenticity that includes altruism, civic involvement and 'intimacy', 'friendship' and 'sociality' (Wang's 1999: 364). The current research explores similar themes and builds on past research which demonstrated that communal authenticity is attained through "caring" and "sharing" (Kozinets, 2002:33).

METHODOLOGY

This research explores the authentication practices within the *Hijabi Cosplay Gallery (HCG)*, the world's largest online community of HCP. Spread across Malaysia, Indonesia and Singapore, the HCG consists of 15,000 members and exists online (Instagram, Facebook, Whatsapp) and offline (e.g. cosplay conventions). We joined the HCG Facebook group to observe the jargon, codes and focal interests of the group. Over the course of three months, we built rapport with key influencers within the group and explained the purpose of our study. At the end of the 3 months period, 25 members of the group were recruited for interviews using snowball sampling (Baltar and Brunet, 2012). The semi-structured interviews focused on themes identified during the preceding literature review and our three-month observation of the HCG community. Interviews were conducted using Facebook instant messaging (IM) and each interview lasted approximately 4 hours. This approach overcame the time constraints, budgetary limitations and logistical impracticalities of conducting research across multiple, foreign jurisdictions. Using Facebook IM allowed us to gather the data in an efficient and timely manner. This platform was well suited to the task since face-to-face interviews with a non-Muslin, western man might have made respondents self-conscious or uncomfortable. IM allowed the female Muslim participants to respond candidly and in a psychologically safe environment. This approach minimised the risk of self-presentation bias and permitted a level of detachment that promoted honest, considered responses. The data were analysed using thematic analysis.

FINDINGS

This research sought to understand how authenticity is achieved and negotiated within the Hijabi cosplay community. Our findings suggest that authenticity is achieved by balancing the competing demands and conflicting values of different audiences. Drawing a line of best fit through this contested space is fraught with difficulties since the sensibilities of the cosplay community and expectations of the Muslim community may conflict. In addition, the cosplayer also has a duty of care to the cosplay character which also demands authentic embodiment. Authentic embodiment is achieved through visual authenticity (costume design) and narrative authenticity (performance of the character) (Rahman, Wing-Sun and Cheung, 2012). A summary of the authenticating practices used by HCP are provided in Table 1.

Negotiating Authenticity Within a Religious Context

Our research suggests there is a clear link between the religious identity of the cosplayer and their choice of cosplay character. Characters that were regarded as too "sexy" and characters related to non-Muslim religious mythologies (e.g. angels, demons, or priests) were considered not suitable; *"I'd avoid characters with crosses...also if*

the character's outfit is too revealing" (W). HCP used 3 different approaches to incorporating the hijab into their costumes: a) Hijab styled as a hairstyle, b) non-styled hijab, and c) wearing headgear (wigs, hoods). Styling the hijab as a hairstyle is a time consuming and laborious process; *"It actually took me weeks of trial and error before I finally got it right"* (MD). Nevertheless, cosplayers try to be strategic about their character selection; *"I consciously pick characters that have some form of headgear or hood"* (MD). The Islamic dress code dictates that HCP have to continually reflect on their religious identity and negotiate acceptable compromises to their costumed selves. Unsurprisingly, respondents reported that the Muslim community took a dim view of cosplay; *"they (Muslims) think Hijab cosplay is quite a disgrace...a wasting of time and money"* (R). However, some HCP's railed against this characterization and asserted that they felt like ambassadors for the Islamic community: *"this kind of Muslim still cannot accept anime hobby ...I want to show that nothing is impossible for Muslim woman to do what they like"*. These differences of opinion among HCP are insightful. For example, (YR) sees no conflict between her Muslim and cosplayer identities; *"You can be a good Muslim and cosplay at the same time as long as you follow the Sharia law...keep your make-up to a simple make-up"*. Other cosplayers were less carefree in their interpretation of Sharia law; *"I get dressed with costume, cover all parts; but still the costume is too attractive, it attracts people to look at us and that is not allowed in Islam"* (S). A pragmatic position was adopted by (R) who emphasised the individuality of each cosplayer; *"Each individual cosplayer has their own values when cosplaying. Some of us prefer to cover our bust with our hijab, some don't mind shortening their hijab to make them look exactly like the character's hair... we are just regular humans...we have our own individual values"*.

Being an Authentic Member of the Hijabi Cosplay Community

In recent years, the Hijab cosplay community has gained power and influence due to its increasing popularity; *"as years pass, the Hijab cosplay community has drastically grown...we have influenced a lot of young Muslims to follow their wish to cosplay and unleash their creativity"* (MA). The rise of social media has enabled this hybrid community to share advice on characterization (e.g. costume choice, poses, hijab/wig) and craftwork (sewing and costume customization). New members are welcomed into the community and helped on their cosplay journey; *"I will normally advise them [new members] on how to modify the costume and how to cover up"* (R). In addition, the Hijab cosplay community forms a loose authority that provides guidelines on clothing conventions. This illustrates the evolution of the community towards more structured and codified practices. Compliance with the Islamic dress code is enforced through encouragement and social pressure. Indeed, those who flout convention are likely to be flamed or trolled online. The Hijabi cosplay community is committed to upholding its Islamic ideals in order to safeguard the moral well-being of its members. Indeed, (R) reported that a HCP who decided to wear a wig rather than a hijab was *"bashed by the hijab cosplay community"* (R).

Authenticity and Performativity of the Cosplay Character

Costume authenticity is very important to HCP. However, the creative constraints imposed by an Islamic dress code dictate that ingenuity and artistic license are often required to reinterpret cosplay characters; *"As a hijab cosplayer, we just need to be more creative"* (R). However, Hijabi cosplay is contentious and Hijab cosplayers are often criticised for their reconceptualization's of characters. In-

Table 1: Sources of Authenticity Within the Cosplay Community

Source of authenticity	Authenticating practices	Example/Evidence
Religious Identity		
	Adherence to Sharia law	"You can be a good Muslim and cosplay at the same time as long as you follow the Sharia law"
	Religious values	"We are just regular humans [...] we have our own individual values".
	Hijabification of the costume	"It actually took me weeks of trial and error before I finally got it right" "I consciously pick characters that have some form of headgear or hood"
	Selection criteria for character	"I'd avoid characters with crosses... also if the character's outfit is too revealing"
	Muslim perceptions of cosplay	"They (Muslims) think hijab cosplay is quite a disgrace...a waste of time and money"
(Hijab) Cosplay Community		
	Encouraging narrative authenticity	"We have influenced a lot of young Muslims to follow their wish to cosplay and unleash their creativity"
	Socialising newcomers	"I will normally advise them [new members] on how to modify the costume and how to cover up"
	Safeguarding Islamic standards (by trolling)	The misbehaving Hijabi cosplayer was "being bashed by the hijab cosplay community"
	Fear of compromising visual authenticity	"Some people don't like hijab cosplay [...] they see it as a break in the authenticity of a character, which is why I am wary of how I would modify costumes" "The less accurate the costume is, the more insecure I get [...] I might offend the other fans of the character if I didn't get it right"
Cosplay Character		
	Re-interpreting the character	"If you insist on accuracy, you end up sacrificing potential"
	Empowerment through creativity	"As a hijab cosplayer, we just need to be more creative" "I want to show that nothing impossible for Muslim woman to do what they like" "I would like to see hijab cosplay be more advanced, inspiring, and give the perception that there is no harm for a hijab girl to be creative"

deed, some HCP are wary of this interpretive approach to cosplaying; "*some people don't like Hijab cosplay [...] they see it as a break in the authenticity of a character, which is why I am wary of how I would modify costumes*". In contrast, some HCP assert their right to autonomy and seek to *"shut the haters' mouth with achievement"* (S). Being true to the character is a guiding principle within cosplay. Nevertheless, the respondents we interviewed unanimously stated that they would not sacrifice their religious beliefs when trying to replicate a character's look. Ironically, it is this religious constraint that grants them the artistic license and freedom to unlock the potential of the character; *"if you insist on accuracy, you end up sacrificing potential"* (M). The goal of every cosplayer is to represent the character as faithfully as possible; *at the end of the day, these are fictional characters ....they represent how much the individual likes that character and he/she wants to portray it to the best of their ability whether they are Hijabi, plus sized, special needs or just a regular fan"* (MD). Importantly, in Hijab cosplay, visual authenticity is redefined and stretched to incorporate the interpretive stance of the individual. Nevertheless, there is pressure to conform to expectations; "*the less accurate the costume is, the more insecure I get...I might offend the other fans of the character if I didn't get it right"* (W). Regardless of the pressure, some HCP seek to challenge the classical stereotypes enforced upon them. Indeed, many happily acknowledged the ambassadorial role of cosplayers; *"I would like to see Hijab cosplay be more advanced, inspiring, and give the perception that there is no harm for a Hijabi girl to be creative"* (S). These challenges to the status quo help promote the normalisation of Muslim cosplay subculture within the broader cosplay community and within society at large. Thus, HCP are helping to address many of the misconceptions surrounding Muslim women in modern society.

DISCUSSION AND CONCLUSION

Our findings suggest that Hijabi cosplay is driven by the desire to construct a lived experience that accommodates both religious and cosplayer identities. By playfully incorporating the hijab into their costumes, HCP reconstruct their religious identity to include incongruent cosplay identities (and vice versa). In doing so, HCP are challenging both the traditional expectations and stereotypes of women within Muslim and non-Muslim communities.

Past research has framed authenticity as a contested concept which is attained through the rejection of mass market forces (see Kozints, 2002). However, we contend this polarised perspective of consumers and market is insufficient to explain the complex negotiations that transpire when pop culture and religion meet. Within religious subcultures, negotiations do not follow the traditional fault lines and so a more nuanced approach is required. Here, the topography of the contested authentic space is not bounded by the mapped grid lines of consumer and market. For HCP, navigating towards an authentic self is not simply a case of taking a bearing for "true" north in 90-degree opposition to the market. Instead, these consumers must watch the compass needle swing and try to navigate a safe course between competing factions of the self. In their search for authenticity, HCP find their authentic selves within three domains; the cosplay character, the (hijabi) cosplay community and the Muslim community. Therefore, HCP are not dealing with one dominant discourse but rather multiple discourses in their "quest for authenticity" and "personal sovereignty" (Beverland and Farrelly, 2010: 842). Authenticating practices are used to reconcile their incongruent identities and to continually negotiate what is authentic, accurate and/or acceptable.

HCP are not passive recipients of meanings from the popular culture, market or Islamic faith. Rather they are proactive negotiators that assemble signs and symbols to create their self-identity. Thus, the costumes they wear represent the outcome of a successful negotiation between their multiple social stakeholders. We suggest that marketing's task here is not to make ontological claims about what the 'real' identity of people is. Based on our observation of these consumers, we believe that marketing will increasingly be required to assist consumers to create identities by evoking, improvising, appropriating and refusing participation in practices and discourses. The role of marketing is therefore to assist consumers in their "quest for authenticity". Future marketers will only remain relevant to consumers if they can provide the resources that allow consumers to craft their own self-narratives. The current research challenges the traditional, domain-specific perspective of authenticity and provides new insights into how tensions between embodiment and religious values are negotiated and resolved. Importantly, our findings casts doubt on the long-held notion that embodied leisure activities and religious practices are discrete cultural categories.

The Aestheticization of Past-Themed Consumption

Ileyha Dagalp, University of Gothenburg, Sweden
Katja H. Brunk, European University Viadrina, Germany
Benjamin Julien Hartmann, University of Gothenburg, Sweden

INTRODUCTION AND CONCEPTUAL BACKGROUND

*Previous consumer research literature highli*ghts the role of aesthetics in the consumption of fashion, the arts, visual images, but also its role for branding (Buschgens, Figueiredo, and Rahman 2019; Charters 2006; Hewer and Brownlie 2007; Joy and Sherry 2003; Maclaran and Brown 2005; Mazzalovo 2012; Peñaloza 1998; Schroeder 2002; Schroeder, Borgerson, and Wu 2015). From this perspective, aesthetics is predominantly about how consumers are motivated to experience beauty, sublime, and sensory stimulation through consuming art and art-like objects in everyday life (Charters 2006; Venkatesh and Meamber 2008).

By contrast, the contextual processes that undergird the valorisation of aesthetics in and through consumption have so far received relatively little attention. Following the idea that a focus on aesthetics is "the study of the feelings, concepts, and judgments arising from our appreciation of the arts or of the wider class of objects considered moving, or beautiful, or sublime" (Blackburn 2016, 8), aesthetic consumption consequently must involve a collective process of valorising the aesthetic: how is 'a wider class of objects' rendered into something 'moving, or beautiful, or sublime'? A shared understanding of an object or concept to be considered aesthetic must build on an underlying process that aestheticizes that element. In other words, a focus on such a process of aestheticization re-orients the discussion from the aesthetic as an essentialist quality inherent to an object (an object is aesthetic) towards a constructivist perspective that zooms in into the development of an object or concept becoming aesthetic (is made aesthetic). Consequently, rather than taking the aesthetic object as a starting point for investigating consumption (Charters 2006), we argue that also the underlying processes which render something into being aesthetic must be explored if we are to understand the role of aesthetics in and for consumption.

In this article, we explore and illustrate such aestheticization processes. Following Hartmann and Brunk's (2019) study of nostalgia marketing, we focus specifically on the theoretical context of 'the past'. The past, here manifested in past-themed brands, products, and consumption practices, provides a rich and powerful facilitating consumption context for such an exploration, primarily for two reasons. First, aesthetic representations of the past permeate nearly all contemporary markets (Brown 1999, 2018) and have become a guiding theme for numerous past-themed brands including retro brands and nostalgia-framed brands in a wide array of industries such as entertainment, technology, film, music, food, fashion, and tourism over the last decades. Second, in such a consumer culture infused and seemingly obsessed with the past, marketers and consumers alike seem to be united in the valorisation of the past as a meaningful frame for branding and consumption activities, whereby such activities are profoundly mobilizing aesthetics in order to allure to the past.

Consider for example the distinct looks of retro brands (Brown, Kozinets, and Sherry 2003), the enchantment (here understood as moments of romance, wonder, magic, and special) created partly through past-themed aesthetics in nostalgia marketing (Bach 2002; Hartmann and Brunk 2019), or the distinct revived aesthetics of re-launched brands marketers use to aid authenticating their brand (Hartmann and Ostberg 2013). From this perspective, the valorization of a past-themed brand or practice as being aesthetic becomes an important ingredient for the creation of enchantment of those brands or practices. In other words, if a past-themed brand or practice is not experienced as being aesthetic, the creation of enchantment is significantly hindered or impeded. To create enchantment, such brands and practices must involve a rendering and valorization of something into something moving, beautiful, and sublime, i.e. aesthetic. Consequently, this aestheticization is conceptually linked to such larger enchantment processes.

Informed by Holt (1995), we approach aestheticization as an instrumental and collective process in everyday consumption domains involving both, objects and practices. Previous research on aesthetic consumption specifically concerning nostalgia suggests that aesthetic consumption can involve romantic inclinations towards the past, but also discontent towards the present such as a temporary coping mechanism and a form of escape from a society (Goulding 2001; 2002). However, while such previous accounts look into the various forms of nostalgia involved in aesthetic consumption, they do not explicitly focus on the processes involved in the aestheticization as such.

METHODOLOGY

Choice of research context: Building on Hartmann and Brunk's (2019) study of the different paths through which past-themed market resources can create consumer enchantment, and because aesthetics play a facilitating role in creating enchantment—i.e., experiencing something as beautiful, sublime, special and magic—we selected two empirical contexts:

1. Viking role-play, which represents the re-instantiation route to enchantment, whereby consumers travel back in time to create and experience a Viking life-world.
2. The retro-designed Govecs E-scooter, which represents the re-appropriation route to enchantment. Formerly an unattractive and uncool East German scooter called Simson Schwalbe, it has now been reinvented as an urban hipsterian lifestyle brand exclusively used and associated with the scooter-sharing company Emmy.

The selection of these two contexts was motivated by our purpose to understand the underlying processes of mobilizing aesthetics in the creation of enchantment aspired by past-themed consumption and production. These two contexts of past-themed consumption help us compare and contrast the aestheticization processes of different enchantment routes—re-instantiation and re-appropriation (Hartmann and Brunk 2019). In this article, these two contexts facilitate our process theorization. The viking context reveals the collaborative and productive mobilization of consumption experiences as an authentic rendition of the past and how the aestheticization process is shaped by consumers as aesthetic agents, particularly when consumers anchor aesthetics in a participatory way and utilize aesthetics for authenticating acts (Arnould and Price 2000). The retro brand context reveals the negotiation of commercially aestheticized past-themed objects.

Data collection: In order to investigate how consumers valorize aesthetics of past-themed retro products and consumption practices, a qualitative methodology was considered most appropriate. We explore the meaning-making processes central to aesthetic valorization of the past with the help of empirical material generated by fifteen in-

depth interviews (McCracken 1988) with consumers who are aware of and experienced aestheticized objects and practices: nine consumers for the Emmy scooter and six consumers for Viking role-play. We pair this interview material with online and onsite observations. Within our particular context-driven sampling frame, we aimed at generating data from diverse consumer profiles, e.g., different age, gender, education, cultural background and income.

Data analysis: All fifteen interviews were recorded and transcribed at full length. We analyzed all empirical material by taking a hermeneutic approach (Thompson 1997), starting with reading and re-reading the data. In order to arrive at the final analytical categories emerging from our data, we engaged in an iterative process that included coding and recoding, constant comparison, as well as regular inter-researcher reflections (Spiggle 1994; Thompson 1997), whereby triangulating across data sources.

In our analysis, we compared and contrasted our two empirical contexts as cases of re-appropriation and re-instantiation routes of enchantment (Hartmann and Brunk 2019). We explored how the aesthetic formation of the past is elaborated through the hybridity of the past and present and across different agents. The identified aestheticization processes succeed in making consumers and communities mobilize the consumption object and experiences as a tasteful rendition of the past. If not, as in the case of commercial reactivation of the past, the formation of aesthetic appropriation would only be limited to the genre (i.e., GDR retro), yet cannot transport itself into a particular form of object/brand. As the process unfolds, the past-themed consumption aesthetics work as integrative commemorating templates where consumers act as aesthetic agents.

FINDINGS AND ANALYSIS

Our findings and analysis suggest *three processes that render aesthetics in past-themed consumption, i) differentiation, ii) interrelation, and iii) integration of the past (see table 1 in the appendix for empirical material).*

Differentiation through a degree of reminiscence

Differentiation refers to emphasizing the dissimilarity, divergence, and discrepancy between the prior and the aestheticized version of the objects and practices to establish an authentication claim. This process is used to contest the aestheticized version of the objects or practices when a commercial re-appropriation of the past is a mismatch with the demanded past form. As illustrated by the different routes to enchantment by nostalgia marketing and consumption (Hartmann and Brunk 2019), seemingly ludic re-appropriation can also be triggered by dislocation. Likewise, differentiation through reminiscence as a process follows a reflective valorization of the aesthetic performance that can stand in stark contrast to settled historical facts (Brunk, Hartmann and Giesler 2018; Hartmann and Brunk 2019). This dislocation is noticeable when there is a discontent towards the reification of the past for commercial aims. We observed that consumers valorize aesthetic qualities through their own connection to the past to render a past version of the object as (more) tasteful compared to (re-)designed versions. In this process, a past is aestheticized through the mythological rendering of 'good old days', and a utopian portrayal of (bygone) honest material qualities (Barthes 1972) and craftsmanship. The aesthetic gestalt of retro, therefore, can create a symbolic dislocation and negative valorization of the commercial offering and, instead, celebrate only the aesthetic bonds of the genre (i.e., GDR retro) as such.

Interrelation through newness

Interrelation refers to the process of evaluating the aesthetic qualities in present conditions by connecting, linking, and joining an aesthetic re-appropriation with contemporary market-level narratives. Here, aestheticization includes the mythical portrayal of the lifestyle product, and a strong link to authenticating acts (Arnould and Price 2000). This process articulates the counter-narratives of market structures and reduces the influence of particular authoritative rules to operationalize modern social links to the past. As is illustrated by Brown et al. (2003), a retro marketing mind-set involves producing the old anew. This regime of newness follows a reactivation of the past by celebrating the past in the form of a distinct look. We observed that consumers are inclined to decontextualize retro consumption towards an amalgam of lifestyle products. The retrofied object design of the Schwalbe scooter, or a Viking axe for example, receives its appreciation largely from the upgraded modern sensibility around the object, which was deemed functional and ordinary back then. In this process, the past is adapted to fit into the set of contemporary ideals related to consumption aesthetics.

Integration through consumers as aesthetic agents

Integration refers to an instrumental act through which consumers acquire and manipulate object meanings to facilitate the symbolic use of the object (Holt 1995). Likewise, practices promote the integrative dimension of the aesthetic appropriation of the past when consumers significantly participate in their creation (Arnould and Price 2000). In the case of commercial aestheticization, consumers who experienced the past created retrospective valuations of the re-appropriated product. In the case of the Emmy scooter sharing company, consumers valorize an original version of Schwalbe scooters from the GDR—which were once valorized as functional and robust—now as "beautiful" "retro design." When it comes to the aestheticization of the past in terms of practices, i.e., Viking role-play, consumers valorize the material culture of the past as being aesthetic by integrating its ability to activate the realm of enchantment (Bach 2002). In this way, consumers act as aesthetic agents and derive enchantment from those products and practices by integrating past-present dynamics. As an embodied aesthetic practice, Viking role-play is re-instantiating the past in the here and now, whereby it becomes encapsulated as an authentic representation rather than purely ludic re-appropriation through its integration into the present by consumers.

CONCLUDING DISCUSSION

This paper has explored the processes of aestheticization in past-themed consumption. The convergence of aesthetics and consumption in the form of retro branding and Viking role-play performances is a part of a wider phenomenon where aesthetic visualization is seemingly being employed in both branding and consumption of the past (*Brown et al. 2003; Hartmann and Brunk 2019*). Our conceptual starting point is that nothing is inherently aesthetic but rather, is collectively rendered aesthetic, which is, in the theoretical context of the past and past-themed brands and consumption practices, achieved through the mixing of existing codes (Brown 2005).

The aestheticization processes we analyzed suggest that an aesthetic reactivation of the past creates an integrative act if there is congruence between marketers' symbolic and material re-appropriation of the past and consumers' valorization of it. However, this act can result in dislocation when the aestheticization of past-themed consumption is perceived to be rendered externally by commercially motivated marketers, as is often the case in retro branding. Meanwhile, when consumers have authoritative voices over the aes-

APPENDIX
Table 1: Summary of Illustrative Data

Aestheticization process	Illustrative Data
Differentiation through reminiscence	I don't know. But it certainly has other manufacturing things today and is easier, cheaper to produce if it is in one piece. I assume that the plastic fender is in front ... I don't know, you can't say that. Because the quality ... so they will have built reasonable ball bearings or such reasonable shock absorbers or something, but I don't like it ... It's ajar, you can tell where it comes from, but I don't like the design, I'm a little bit retro there. Interview (retro-themed consumption) I think it's fancy, I don't find it more beautiful because I prefer the old design, because it is totally authentic to me, but they are fancy, they remind me of it, they look cool and I think they are because of it to be so popular with people. I: You think about, because of the looks above all? Because of the design? R: Yeah, this vintage look that is totally in vogue and exactly, I think that's why, yes, people try it out because it looks chic. Interview (retro-themed consumption) I probably say something is not polite to say, but... I tried to watch series Vikings. And after about ten minutes I was almost on my way to kill the TV. I know I have to try to watch because so much fantasy, but they are doing it so good, so close, for example, let's say I just have taken an example out of there, they are making someone having perfect outfits with all the dresses and everything but having blue hair. It is so close. They go to a different place they go to Haithabu, which is a very historical correct museum they have shows every year in Germany, but there was in Viking time it was in Denmark but now in Northern Germany. And Haithabu is a really flat part of Germany. They went to Haithabu but climbed up these huge mountains. No mountains in Haithabu, you go oh my god. It's small silly things, and I know I should try a bit other but rather I watch documentaries so I take out all the documentaries. It is so hard for me to see those Viking pop cultures where I am just waiting for them to pick up the big horn helmet and fur things on their clothes. Oh no, I cannot see it. Interview (Viking role-play)
Interrelation through newness	"you have linen, the wool, so they only allowed tents made linen and wool. And I understand in a way, but for visitors, it's not visible the difference, and the linen was also not a fabric not easy to make it is quite expensive in Viking age, so why would you make a tent out of that (laugh)? It is really silly, and you come back to the modern problem to us because we want to do everything as authentic as possible we would like to have a linen tent, but if linen gets wet, it gets really really heavy and then you take your tent car would break. Because we have really a big tent, we have quite a big shop (laugh)..." Interview (Viking role-play) "But what me, you know, what I don't like is retro design just to make it retro. If so, you have to somehow connect it with today's zeitgeist. At Emmy, for example, I have a retro design, but I make an electric scooter out of it. Then for me it is a thing that somehow fits together and then you can sort of add an old design to the present day. What I personally don't like so much is when you just use old things as they are with the negative qualities that they had. If you ask now with the Simson. I mean, she stank. It was certainly not very environmentally friendly, then I would find it nonsense if you start again to launch a Simson 2, which may look like the Simson 1, but with a petrol engine. If you start to trim a Simson on an electric scooter again, it would have its appeal again and that's how I generally see it when it comes to retro design." Interview (retro-themed consumption)
Integration through consumers as aesthetic agents	So everything you can cover is ok if you can go as, I think, you should try to do a bit better next season then you were in the last season. So, for example, if you just started maybe have linen tunic, its machine sewed the next time you make it hand-sewed. And the next time you make a new shirt plant-dyed, for example. So you try to upgrade yourself and everything you have. So and then you make, get a tent and then you may get a bed, then you might get a chest. You might get plates, cups, glasses.... Interview (Viking role-play) Here in Ribe, they have the archaeological depot. I do leatherwork I make shoes and bags, and all kinds of other leatherwork from Viking age and we got a chance to see all the Viking leather found find they got in Ribe. There was one piece of leather, a description that stood that was the upper part of shoes, this part of the shoes that outside. Looking at how the holes were in the leather, I said this is, can never be the upper part because it turns to round way around. So for me, it was a sole and not the upper part. Interview (Viking role-play)

theticized performances in the form of authenticating acts (Arnould and Price 2000), the overall practices facilitate the enchanting dimension of the object, which in turn allows consumers to become aesthetic agents and valorize the aesthetics of object or practice in terms of enchantment. Retro aesthetics, in the case of retro-themed consumption, mobilize both positive and negative aspects of nostalgic approaches towards the aesthetic formation of the past. When consumers who are particularly nostalgic towards the past valorize a past-themed branded object as a bad copy, they celebrate the retro era instead. Conversely, if the past-themed branded object is valorized as a lifestyle brand, then it is celebrated by that aestheticized version of the brand. In the case of Viking role-play, the act of material production of the most desirable images about the past create an integration to that aesthetic of the past. The aestheticization process renders object qualities into aesthetic qualities through the aesthetic agency of consumers.

The aestheticization of the past has different modalities, forms, functions, content, and contexts. Our analysis of Viking role-play and Emmy retro-themed consumption reveals that the co-creation of this aesthetic-formation of the past includes the processes of differentiation, interrelation, and integration. These processes are particularly helpful for marketing managers to understand the details of co-creation inherent in the aestheticization of the past in order to create enchantment strategies that embrace consumer-generated resources in the rendering of aesthetics. The co-presence of consumer and material resources in aestheticization processes facilitates the creation of enchantment in past-themed market and consumption contexts. Viking role-play consumption differs from the commercial retro-themed consumption in terms of the "spirit of do it yourself" (Barthes 1972), which indicates that the very development of past-themed material production often relies on the most desirable images of the past and its hyper-real objects (Baudrillard 1993). This research contributes to previous accounts on aesthetics in consumption and retro practices by broadening the theoretical scope of extant research, which focused mainly on an essentialist approach to aesthetic consumption. Contrary to prior research on aesthetics in consumption, this article illuminates the collective processes involved in the creation of a shared understanding of an object or concept to be considered aesthetic. In doing so, our study highlights the conceptual link between aestheticization and enchantment, thereby suggesting that underlying aestheticization processes are a vital ingredient in the creation of enchantment aspired by past-themed brands and practices.

Oppositional Loyalty Among Individuals: A Triadic Reading Grid For Loyalty With a Polarized Brandscape

Amina Djedidi, Université Paris-Est Créteil, IRG, France

INTRODUCTION

Fournier (1998) argued that brand relationships should be considered on an aggregate level, i.e., brandscape level. White and Dahl (2006) furthermore highlighted the need to study loyal consumers motivated both by brand attraction and by the desire to not be associated with an avoided out-group. Until now, brand loyalty has been defined as a dyadic phenomenon, linking consumer and brand. Through this study of oppositional loyalty (OL), brand loyalty acquires a new component borrowed from the literature on anti-consumption. Although the phenomenon of OL has been documented in studies on brand communities (Muniz and Hamer, 2001), lack of understanding still prevails when transposing the phenomenon to an individual not openly belonging to a brand community (Djedidi, 2019). Therefore, the question raised herein is whether this phenomenon would exist beyond the community the oppositional loyal member hitherto defended. This research explores the concept of individual OL and proposes a new reading grid for brand loyalty as an extension to traditional perspectives. Thus, examining the potential of OL to enrich the concept of loyalty merits attention, providing insight into this type of loyalty, which dissuades consumers from approaching competition, as well as reducing brand polygamy. Consequently, the present research question is: what are the conditions which make oppositional brand loyalty more likely?

Loyalty has been the subject of intense debate for more than eight decades. Research on loyalty first defined this concept as a behavioral dimension (Tucker, 1964). Progressively, loyalty was then defined as comprising two components: behavioral and attitudinal (Fishbein and Ajzen, 1973). To be considered a loyal consumer, it is not enough to consider buying the same brand every time; consumers must nurture positive feelings toward the brand (Oliver, 1999). Consumers can go further by considering the brand as a partner (Fournier, 1998a) and an extension of themselves (Belk, 1988). So far, this consumer-brand relationship has only been described as dyadic.

Nonetheless, some researches emphasize how positive and negative feelings, attitudes and choices are embedded in a complex relationship, enabling individuals to express themselves and achieve a psychological balance. Indeed, knowing that possessions can be understood as an extension of the self (Belk, 1988), Heider (1958) theorizes that, to gain harmony with oneself, individuals develop a series of harmonies involving contrasting attitudes to maintain a balance. Bourdieu (1979) employed this notion of contrast using the following polarities: taste and distaste, refined and vulgar, and beauty and ugliness. Such pairs enable identification of lifestyles and social classes. Appreciation of these contrasts is achieved by using a system of categorization, perceptions, thoughts and actions. In anthropology, Wilk (1997, 2012) reinforced Bourdieu's (1979) work based on the assumption that the status of a food or food group is related to a social differentiation system which may or may not be hierarchical. Moreover, he considered how both taste and distaste define relationships with objects by postulating that no form of consumption can be separated from non-consumption in reality. This interaction between chosen and discarded, desired and undesired, and positive and negative, gives greater insight into the consumer-brand relationship, which, until now, has only appeared as dyadic (consumer-chosen brand). The consumer-choice-anti-choice triad provides more insight into the interaction between positive (consumer-chosen option) and negative (consumer-discarded option) relationships.

In parallel, research on brand communities highlights the combination of a positive relationship with the brand and a negative relationship with its competitor, a term Muniz and Hamer (2001) labelled 'oppositional loyalty'. Brand community members express loyalty in two ways. Firstly, they define themselves by both the brand they consume and the brand they do not consume. This reflects an entanglement of symbolic consumption (Sirgy, 1982; Solomon, 1983) and anti-consumption (Hogg, 1998, Lee at al., 2009). Second, they express their opposition to the competitive brand by: (1) developing an ironic rivalry towards consumers of the competitive brand (Muniz and Hamer 2001), (2) expressing oral (Hickman and Ward, 2007) and physical aggressiveness (Ewing et al., 2013). The essence of OL lies in the "*antagonistic vision of competition*" found among these groups (Ewing et al., 2013) and perceived danger (Muniz and Schau, 2005). A literature review reveals a gap on two levels: research on traditional loyalty and investigations on oppositional loyalty. Indeed, literature on traditional loyalty focuses on the consumer-chosen brand relationship and its scope is reduced to the positive consumer-brand relationship, failing to introduce other brands present on the market, which may fuel this positive relationship. However, such positive relationship can conversely feed an individual's negative relationship with other brands. Instead, researchers have chosen, by omission, to use the "*ceteris paribus*" hypothesis, reducing the field to the simple dyadic consumer-brand relationship. When choosing to focus on both positive and negative relationships, OL research has mainly focused on brand communities. However, momentum derived from group meanings and affiliations immerses the individual in the euphoria of "*deindividuation*" (Zimbardo, 1969) following the current group. Once individuals are beyond the influence of the brand community, their reaction can change and their euphoria soften. It is at this point that consumers' immunity from going to the competition vanishes (Thompson and Sinha, 2008). This research therefore focuses on the OL of the individual rather than of the brand community.

RESEARCH METHODOLOGY

OL is likely to emerge in highly competitive markets (Muniz and O'Guinn 2001) such as smartphones and disruptive markets where brands try to dethrone the leader or "the king of the hill" (Smith et al, 2001) and to gain legitimacy and market share (Djedidi and Hani, 2016). Moreover, the symbolic consumption of smartphone brands increases social pressure on consumers. A two-phased data collection procedure was undertaken through interviews with male and female informants from different socio-professional classes: (a) an exploratory phase to identify the existence of oppositional loyalty comprised 30 semi-directive interviews in 2012 using snowball method; (b) a development phase to gain better insight into OL and its evolution comprised 14 life stories of consumers who agreed to a second interview in 2014. They were informed that this phase was to "know more about their overall consumption". Interviews were performed in interviewees' homes to preserve privacy. The focus was on OL to brands from different categories to nullify product category effect and explore the phenomenon across product categories. Interviews were recorded and 706 pages of transcribed interviews were coded using Nvivo software. Thematic content analysis was undertaken through *a priori* and *a posteriori* coding (Miles and Huberman, 2002), moving from *emic* to *etic* coding (Belk et al*., 2*013).

RESULTS

Presentation of the findings begins by examining OL on two levels and describing its evolution over time.

OL as a triadic and polarized form of brandscape

The specific form of OL lies in its triad configuration, linking consumer, chosen brand and avoided brand. This polarized form of brandscape is the essence of an individual's OL, nurturing both attitudes and behaviors.

Table1: Oppositional loyalty of the individual form and dynamics

Oppositional loyalty triadic and polarized form in different product categories: clothes, video games, cinema theaters, smartphones, computers, restaurants…		
Attitudinal level	**Chosen brand (Brand A)**	**Rejected brand (Brand B)**
Presence of dichotomy perspective of *chosen vs. rejected option* and the *me/us vs. them* manifesting as market polarization in consumer brandscape where dyadic relationships are interwoven in a more inclusive and triadic model.	Positive emotions, feelings and cognitions towards the brand, its products and its consumers. Tendency to identify oneself with fellow consumers of this brand.	Negative feelings and cognitions towards the brand, its products and its consumers. In some cases, consumers can even resist Brand B and define themselves by dis-identifying from its consumers.
Behavioral level	**Chosen brand (Brand A)**	**Rejected brand (Brand B)**
Behaviors directed at brands reflecting this embedded dyadic relationship in a larger triadic and polarized pattern involving simultaneously positive and negative behaviors.	Brand purchase and repurchase intentions are the most common identified behaviors. In some cases, strong brand engagement is observed.	Consumer avoids, resists and/or boycotts the brand. In some situations, they are ready to forgive this brand only if it metamorphoses into Brand A.
Behaviors directed at consumers are word-of-mouth and teasing. They are manifested in action/reaction dynamics with others and reflect polarization through perceived comparison and opposition.	Consumers positively put forward the chosen brand, spread positive W-O-M, and recommend it. Others brag and bask in the reflected glory.	They question, criticize and devalue Brand B, and warn against it.
Oppositional loyalty dynamics		
Attitudinal level	**Evolution over time (2012-2014)**	**Identified sources**
Brand choice and anti-choice based on functional aspects	The intertwined positive and negative attitudes changed as there is a attenuation of their momentum and an increase in hesitation when consumers argue about brands.	Competition improvement could have introduced doubt about the superiority of their chosen brand.
Brand adoption and rejection based on symbolic aspects	Consumers maintained the tightly-linked game of rejecting undesired brand image and embracing a more desired one as their discourse remained unaltered.	Image is built over time and is not easily altered in the short term.
Behavioral level	**Evolution over time (2012-2014)**	**Identified sources**
Chosen brand purchase and repurchase intention as well as avoided brand rejection are dual behaviors characterizing oppositional loyal consumers.	Two identified tendencies: a constant one that translate a rigid tandem of adoption and avoidance and a hesitating one where deep beliefs about the unique performance of the chosen brand may have been shaken.	Constant behaviors are nurtured by functional and/or symbolic (self-congruence) added value whereas hesitation is fueled by competition improvements that shake the chosen brand superiority myth.
Teasing and spreading W-O-M are behaviors that may be consistent or altered through time.	Consumers may maintain their everyday lives flavored with teasing and express themselves by spreading W-O-M as long as comparison with competitors is favorable.	As the essence of oppositional loyalty is rooted in comparison, environment and competition evolution may alter its momentum as comparison is no longer a source of self-esteem enhancement.

Bi-dimensional attitude

Informants' discourse mainly concerned opposing choice and anti-choice in a very spontaneous manner. As presented in table 1, these oppositions are presented on 3 levels of discourse: product, brand image, and consumer image where product, image and consumer of the chosen brand are always portrayed by oppositional loyal consumers as being better than those of the rival brand. For example, when asking Louisa (female, 33y, pharmacist) her impression of a typical Samsung user, she answered "*I love Samsung, I am happy when I see people holding a Samsung, it is great!...they*

wear colorful clothes, they are smiling and modest (then spontaneously added) But I don't like iPhones, when I see people with their iPhone, they seem pretentious (grimace)". An inverse effect is true with some iPhone oppositional loyal consumers. Adam (male, 32y, entrepreneur) describes iPhone consumers as important and having a certain social status, and Samsung consumers as those "*who only eat and drink, it proves that they are sedentary, they're not interesting, they do nothing in life!* » (Adam).

This spontaneous comparison, revealing a polarized vision of brands, is not exclusive to the smartphone category. For instance,

when asked about cinema, Fleur (female, 40y, doctor) answered "*I like cinema, I prefer art films, despite being a difficult genre (spontaneously continued) I don't like blockbusters, usually action films with special effects, they are a waste of money: cars are broken, stuff is stolen…they attract a popcorn-eating audience which makes noise….it is annoying…sometimes they include very bad jokes I don't like…. There is an art film, Guillaume et les Garçons, which costs nothing but conveys many messages and encourages us to question things, very interesting… the audience tends to be silent, respectful*".

This dichotomy of chosen vs. rejected and "me/us vs them" present in the three levels of analysis reflects this polarization in the consumer's mind around chosen and rejected brands, enabling them to derive value from this opposition. This level reflects the shape of brandscape (Sherry, 1998; Thompson and Arsel, 2004) in a polarized configuration, as perceived by the oppositional loyal consumer (Djedidi, 2019) reflecting the polarized form of competition (Djedidi and Hani, 2016; Muniz and O'Guinn, 2001).

Bi-directional behavior

Behaviors directed at a brand reflect an embedded dyadic relationship in a larger triadic pattern, involving simultaneously positive (purchase, engagement) and negative (avoidance, resistance, boycott) behaviors. Behaviors directed at consumers are word-of-mouth and teasing. These are manifested in action/reaction dynamics with others and reflect this perceived comparison and opposition.

Although presented as two distinct dimensions, attitude and behavior are revealed as being intertwined. Through the life stories, more details about interviewees' family surroundings, lifestyles and value systems were provided. Adam grew up in a large family with limited means and defines himself as a businessperson. His chosen brands are statutory and reinforce his actual social status, whereas his rejected brands are those reflecting a different image. Sophie was raised in a family where money was earned. Her chosen brands are those which prove they deserve her loyalty and the rejected ones fail in this. She maintains a comparative discourse, aiming to highlight the benefits of the chosen brand and the defaults of the rejected brand. Léo does not like his image and has never seen himself as good-looking. He believes this has not changed even when consuming brands promising an attractive image. His loyalty is only to brands promising technical performance; and he openly opposes brands promising beauty and sociability.

Dynamic nature of OL

Results in table 1 highlight how the only change observed on the attitudinal dimension related to the product as a result of an improved competing offer. However, comparative discourse on image remains consistent. This result seems in-keeping with the essence of brand image which is relatively stable and difficult to change in the short term. The behavioral dimension of OL presented similar trends, since intention to repeat purchase changes over time when linked to product performance, and remains stable concerning image.

DISCUSSION AND CONCLUSION

This study provides insight into loyalty for academics. By showing its existence on an individual level outside communities, the notion of loyalty shifts from a dyadic to a triadic form. The findings contribute to a more complete understanding of loyalty by demonstrating that it can be expressed through simultaneous consumption of the chosen brand and anti-consumption of the competing brand. The emergent nature of loyalty reveals it to be triadic rather than dyadic as a manifestation of a polarized brandscape. This simultaneous positive-negative relationship is evident in interviewees' discourse where they express their relationships with the chosen brand

and with the avoided brand in an intertwined way. We can therefore argue that measurement of loyalty should be more open to include the negative relationship with competing brands.

This research has important implications for brand managers, highlighting consumers' contributions to brands, either as an asset for the chosen brand or as a liability for the avoided brand. Oppositional loyalty is expressed on (1) the attitudinal dimension, referring to positive and negative cognitions and emotions towards each brand; and (2) the behavioral dimension, reflecting repeat-purchase behavior, positive word-of-mouth for the selected brand and avoidance, boycott and negative word-of-mouth for the rejected brand.

It also explores the dynamic nature of oppositional loyalty, as it *may remain constant over time* when animated by brand image rejection. It can also evolve when reflecting rejection related to product performance potentially affecting consumers' immunity. This provides some elucidations of the results of Thompson and Sinha (2008) questioning oppositional loyal consumers' immunity to competitive brands.

Far from espousing consumer enslavement logic (Baudrillard, 1970), this research places OL in the continuation of work on ordinary resistance, reflecting consumer empowerment (de Certeau, 1984; Fournier, 1998b; Roux, 2007). Indeed, results highlight the way consumers, through oppositional loyalty, are not subject to the market but rather interact with it. They act as equal partners who can simultaneously reward and punish market actors through consumption and anti-consumption.

The research further contributes by suggesting that, due to the OL phenomenon, market polarization can reduce competition. Fierce competition between brands may lead to perceived market polarization around two major competitors and, therefore, reconfigures market in the individual's mind through brandscape. This can eliminate other competitors from consumer brandscape. As such, competition is also shifting from a substitution to non-substitution perspective as brand consumption is mainly fueled by its rival anti-consumption. Moreover, Sabri et al. (2020) studied how competitors' collaboration decreases the perception of price fairness of new products. Consumers disappointed by price unfairness may adopt less powerful brands to support them and avoid allied competitors as punishment. Then, this paper results may reveal a new episode of post-coopetition impact on the emergence of OL.

Sekhon and Armstrong Soule (2020) recently identified the role constellation of consumption choices plays in nurturing pro-environment anti-consumption action. This study offers an angle of analysis for studying how consumption and anti-consumption would be complementary (García-de-Frutos et al (2018) and intertwine to nurture green demarketing practices.

Recent papers on anti-consumption in the food industry tend to propose insights for businesses and society to encourage conscious consumption practices (Kashif, 2019). Islam et al. (2019) studied how incongruity leads to fast food brand hate. De Bernardi and Tirabeni (2018) studied the implementation of alternatives to conventional food systems and to improve food anti-consumption behaviors. The creation of a sustainable food supply chain can benefit from OL dynamics and encourage consumers to adopt more sustainable habits.

When studying vulnerability, Cherrier and Hill (2018) depict anti-consumption among materially-deprived consumers less as strategies for fancied emancipation and more as survival tactics. The OL framework provides potential answers to Cherrier and Hill's (2018) proposition to study how governments include homeless people as consumers in exchange systems. Indeed, the triadic and polarized form opens doors for public policies to seize anti-consumption

as a nurturing force for consumption and, therefore, homeless social inclusion.

Beyond its contributions, this research has limitations. Firstly, different product categories were covered by this research, evoked by interviewees, such as smartphones, clothes, video games, cinema theaters, computers, restaurants…etc. Secondly, life stories were analyzed thematically whereas a structural analysis would deepen insight into OL. Future research could quantitatively investigate the extent to which OL may be related to consumption conspicuousness (Makri et al., 2020) or individual factors.

Thingification: Interrupting Subject and Objects

Julie Emontspool, University of Southern Denmark, Denmark
Cristiano Smaniotto, Aarhus University, Denmark

INTRODUCTION

Growing awareness about the harmful impact of human-centric social systems – among them markets – on the environment challenges the sustainability of humanity's focus on itself. As the circular economy illustrates, alternative arrangements promote a reconceptualization of human-centric systems by drawing upon ecological principles of harmony with(in) the material environment. Yet to succeed in this reconceptualization, we must question the social ontology informing our understanding of the relations between humans and the environment in which they and their consumption practices are embedded (Slater 2014). If we want to uncover new modes of being – and consuming – with(in) the environment, we must therefore rethink the togetherness of (human) subjects and (non-human) objects.

This paper builds on consumer research that redefines the ontological assumptions about the relation between consumers and objects (Belk and Humayun 2018; Bettany and Kerrane 2011; Borgerson 2005; Ferreira and Scaraboto 2016; Hoffman and Novak 2018). Existing research proposes that agency results from the interactions between subjects and objects, thus questioning the idea that objects are passive entities which consumers act upon, in favor of a view of objects as capable to act on subject. We move further than these studies to tackle an even more fundamental – yet underexplored – ontological assumption: the primordial dichotomic separation between subjects and objects. We investigate how this separation is recursively achieved by asking: how are consumer subjects constituted as separate from objects?

To answer this question, we draw on Barad's (2007) neo-materialist approach to ontology to develop a theoretical framework accounting for the simultaneous constitution of subjects and objects, which we call the process of thingification. Thingification emerges from a recursive unfolding of interruptions, moments when habitual relational configurations are halted and disrupted (Dawney 2013), and the boundaries of things (subjects and objects) arise. We apply this framework to the case of polyurethane competitive swimsuits, withdrawn from the market after a short but much-debated existence. We identify three types of interruptions (material, moral and institutional) through which the suit (object) was separated from the swimmer (subject). We discuss the implications of our paper for identity and subjectification perspectives, which enable a rethinking of current social and environmental unsustainable modes of being.

LITERATURE REVIEW

Relation(s) between subjects and objects are at the core of consumer research (Borgerson 2013). Focusing on identity, existing studies address how *consumers use objects* to: extend their self (Belk 1988); solve tensions in their identity narratives (Ahuvia 2005; Shankar, Elliott, and Fitchett 2009); reproduce class identity (Holt 1998; Moisio, Arnould, and Gentry 2013); shape group identity, such as family (Epp and Price 2008; Moisio, Arnould, and Price 2004) and subculture (Kates 2002; Schouten and McAlexander 1995); perform gendered identity (Jantzen, Østergaard, and Vieira 2006; Moisio et al. 2013; Phillips and Sego 2011). Behind this perspective lies the assumption that subjects and objects exist as two separate sets of finite entities. On the one side, subjects (consumers), which constitute themselves through intersubjective interactions (Jantzen et al. 2006) because they are in possession of agency, i.e. the capacity to construct, interpret and transform a symbolic environment. On the other

side objects, "thing-in-themselves", which lack agency, and around which consumers create meaning (Bettany and Kerrane 2011).

Digging deeper into questions of consumer agency, Foucault-inspired studies theorize subjectification as discursive negotiations shaping agency against a background of structural conditions. This research details how consumer subjects are created by ideological struggles (Karababa and Ger 2011), governmental processes (Giesler and Veresiu 2014), corporate (Moisander and Eriksson 2007) and cultural discourses (Mikkonen, Vicdan, and Markkula 2013). Some studies even show how consumers resist normalized subject positions, such as body ideals (Ourahmoune 2017; Zanette and Pereira Zamith Brito 2018). All these studies bring forward the relational character of subjects' agency, yet still treat subjectification as an intersubjective process, where objects are *used to* shape consumer agency and thus specific subjectivities.

Few studies acknowledge objects' active role in shaping subjects through material negotiations beyond processes of signification – such as studies on self-service devices (Du Gay 2004), loyalty cards (Beckett 2011) and food labels (Yngfalk 2015). Food labels, for instance, disembody consumers' evaluations of spoiled food, directing agency away from the consumer for the timing of food disposal (Yngfalk 2015). Despite these insights, such perspectives reinforce the assumption of the a-priori division between a world of subjects and one of objects. Recent studies about human-object assemblages have questioned this division by addressing objects' dominance over subjects (Belk and Humayun 2018). But instead of delving into cases where subjects and objects become blurred, we problematize existing dichotomies between subject and object by investigating how subjects and objects are constituted simultaneously.

SEPARATING SUBJECTS AND OBJECTS THROUGH THINGIFICATION

To investigate the simultaneous constitution of subjects and objects, we draw on a neo-materialist interpretation of Spinoza's monism, according to which there is only one substance constituting the world and all its elements. From this perspective, differences between entities of various types (such as computers or humans) are mainly differences of form. This form represents a thing's mode of being, a temporary coagulation of relations that gives things their seemingly fixed character. Barad (2007) calls such modes of being "intra-actions", the recursive unfoldings of relations which establish the material conditions of possibility of a thing.

According to Barad (2007), intra-actions also enact the separation between subjects and objects. That is, the boundaries of things are determined through the form(ation) of things themselves, which represent interruptions in the continuous flux of relations (of substance) ontologically constituting the world and all its elements. In other words, things are machines interrupting flows of energy and matter (Deleuze and Guattari 1972). For example, while eyelids interrupt the flux of light towards the eyes, the body defines the boundaries of itself. Indeed, when closing their eyes, humans phenomenologically recognize themselves as an entity apart from their material environment, a thing interrupting a recursive relational flow.

It is therefore in these interruptions that we must find instances of the recursive process of "thingification", that is the process through which subjects and objects are simultaneously constituted. Interruptions are moments "that halt and disrupt the flow of experi-

ence" emerging from "habitual modes of being [a subject]" (Dawney 2013, 628). In other words, during these moments, subjects become aware of the agential configurations they normally partake in and that define their habitual modes of being (like when closing their eyes). From the moment of birth (when subjects are first separated from the surrounding environment, the mother's womb) and further through socialization processes, interruptions happen recursively while defining and sharpening the boundaries of the subject as well as the object(s) from which it is separated.

Interruptions are always corporeal, as they are a separation of the body from other things. Yet humans make sense of these separations also through language, which separates things into concepts and categories. Language offers a frame through which we make sense of the relational material configurations that define our habitual form, while excluding an infinite number of other possible configurations. For example, the sensation of pain felt after cutting ourselves with a knife describes an interruption of our habitual mode of being, which is normally pain-free. The word "pain" acts as symbolic reference for a relational configuration subject-object that we learn to avoid. In describing, thinking and speaking of "pain", we then refer to an infinite number of possible modes of being in which the subject must be separated from another thing, the knife.

METHOD AND CONTEXT

This study draws on a discourse analysis of news articles published in connection to the introduction, use and subsequent banning of full-body polyurethane swimsuits in official swimming competitions. It is an ideal case for studying how interruptions establish a distinction between subject and object as the debate circled around the question of who or what a swimmer is – a human body alone or a body-suit ensemble.

We collected data in English- and Danish-language news media outlets, both generalist and specialist. We selected 224 news articles published between 2000 and 2018, using search words relative to the polyurethane suit debate such as "polyurethane swimsuits", "performance-enhancing swimsuits", as well as words referring to specific brands and athletes.

After a first review of the data, coding proceeded iteratively, alternating between individual coding (both theoretical and emergent) and joint discussion of the codes between the authors. The present paper concentrates on the insights gathered from a sample of 55 articles selected by hand, which served as basis for an in-depth analysis of the interruptions through which a specific consumer subject (the competitive swimmer) is constituted in its separation from a specific object (the plastic suit).

FINDINGS

Our findings indicate that recursive interruptions establish subject-object distinctions when consumers identify disruptions in their habitual modes of being. We identify three types of interruptions constituting the process of thingification by which things are constituted through their separation: material, moral and institutional. Table 1 provides a definition of each type of interruption along with illustrative data excerpts.

Material interruptions

Material interruptions erect boundaries between subject and object by distinguishing the body from the suit. In our data, subjects articulate this distinction by differentiating between the body within the suit as opposed to the body without. Such distinctions appear when swimmers refer to the embodied experience of swimming with the suit as different from their habitual swimming experience

(Excerpt 1). But material interruptions are also articulated through attributions of agency to either the subject or the object in swimming performances (Excerpts 2 and 3).

In addition to confirming the active role of objects in shaping consumer agency through processes of subjectification (Beckett 2011; Du Gay 2004; Yngfalk 2015), the identified material interruptions highlight the co-constitution of subject's and object's agency through the interruption of habitual experience.

Moral interruptions

Moral interruptions arise from the discursive embedding of the material interruptions in society's values. They revolve around the central question of what (morally) constitutes a subject, here the swimmer. In our findings, moral interruptions relate to an ideological distinction between pure swimming and technology-enhanced swimming (similar to Kozinets 2008). The interruption arises from a contamination of the sport's perceived purity through the use of the performance-enhancing object, which generates nostalgic calls for a return to the "real", that is technology-free, sport (Excerpt 4). The interruption of the sport's purity is further accentuated when the suit compensates for the subject's inadequacy in terms of their swimming performance, which is perceived as an unfair advantage. Such advantages are interpreted as sharpening existing (class) inequalities and harming the (pure) quality of the sport (Excerpts 5 and 6).

Therefore, moral interruptions connect the symbolic and intersubjective structures upholding ideological categorizations of right and wrong to consumer's corporeal experience of the material world. Here, materiality is not *used to* constitute the moral subject (Giesler and Veresiu, 2014), but the moral subject arises from its material relation with the environment.

Institutional interruptions

Institutional interruptions relate to the interruptions that institutional actors generate to sharpen the definition of a subject. Our analysis shows two types of institutional interruptions. On the one hand, institutional actors rely on scientific testing of performances in order to establish or strengthen the dissociation between subjects and objects (Excerpts 7 and 8). The subject is then defined by negative affirmation, where the swimmer is the body not wearing polyurethane suits. One the other hand, alternately defining the swimsuit as equipment or as swimwear allows regulatory institutions to either ban or allow the suits (Excerpt 9).

These findings suggest that the discursive negotiations through which institutions shape the consumer subject (Giesler and Veresiu 2014; Karababa and Ger 2011) are also always material negotiations of both the subject's and object's form. In other words, institutions are machines that interrupt the flows of matter defining things and their modes of being.

DISCUSSION AND CONCLUSION

Our findings add to existing knowledge about consumer-object relations by explaining how subjects and objects are constituted as different entities from a same ontological foundation. Doing so, this article continues important work questioning the existence of a-priori ontological differences between subjects and objects, and resulting attributions of agency (Belk and Humayun 2018; Bettany 2007; Bettany and Kerrane 2011; Borgerson 2005, 2013; Hoffman and Novak 2018). To compensate for an overemphasis on the capacity of subjects to act, these studies focus on how objects act on subjects. They propose that agency is a result of the interactions of subjects' and objects' properties. Our study goes a step further in questioning this inherent distinction between the categories of subjects and objects.

Table 1 – Three types of interruptions

Type of interruption	Definition	Illustrative excerpts*
Material	The moment when the habitual embodied experience is challenged and the form of the body is reconfigured. This interruption withdraws the subject's material composition from its environment. As a consequence, the subject realizes its own embodied boundaries and position of subjectivity. In our case, the interruption disturbs the habitual experience of the body in a suit, while the focus turns to body-with-the-suit (vs the body-without). The boundaries between what is the subject (the swimmer) and the object (the suit) are sharpened by such interruption.	**Excerpt 1** "Every time I put on that suit, I know I'm going to fly," said Ryan Lochte, who set a world record in the 200-meter backstroke at the world championships. **"I've been swimming constantly for like 15 years, and I've never felt this good in the water. It's super thin, and it keeps you floating.** If you try that suit once, you're never going to put anything else on."" (*New Suit Makes Splash in Debut; World's Best Swimmers Say Speedo's FS Pro Is Slick, Quick* – The Washing Post, July 31 2007) **Excerpt 2** "Many sceptics look forward to swimming going back to its bodily essence, where it is what is inside the suit, rather than outside of it, that makes a difference" [translated from Danish] (*Svømmere er blevet nogle underlige fisk* [Swimmers have become some weird fish] – Politiken, July 26 2009*)* **Excerpt 3** "The consensus is that it is **the suits -- and not the swimmers -- that have gotten faster** […] I hope there will be a time when I can beat Michael Phelps without the suit" (*Phelps Loses, and a Debate Boils Over* – The New York Times, July 29 2009)
Moral	The moment when the new embodied experience is translated into moral terms. That is, material interruptions (as seen above) question the defining boundaries of subjects and objects: what is a subject (in this case, a swimmer)? This question is posed in terms of what constitutes swimming (what are the values of the practice and which actors [should] define swimming).	**Excerpt 4** "Technology . . . has changed the sport completely. Now it's not swimming. You hear a headline; it's always, 'Who's wearing what suit?' It's not swimming. **I'm looking forward to the day we can call our sport swimming again**" (*At Worlds, 'It's Not About the Swimmer'; Suits Are Again Talking Point After Phelps Is Routed* – The Washington Post, July 29 2009) **Excerpt 5** ''The thing that's really hurt more than anything else is **the whole suit situation has devalued athleticism,**'' Salo said. ''A lot of **kids who aren't in very good shape can put on one of these suits** and be streamlined like seals.'' (*Swimming Bans High-Tech Suits, Ending an Era* – The New York Times, July 25 2009*)* **Excerpt 6** "On a more local level, when $100,000 world record bonuses aren't on the table, **it increased the gap between the haves and have-nots. In a sport that is already stigmatized by the elitest, wealthy, country-club persona, telling swimmers that they couldn't legitimately compete without spending $700 on a suit demoralized the masses and devalued the effects of hard-work by both swimmers and coaches. The suits corrected flaws in technique and made up for a lack of attention to detail."** (*A Eulogy For Polyurethane: Masters Nationals Closes Supersuit Era* – SwimSwam Magazine, May 25 2010)

| Institutional | The moment when the object is defined through institutional interventions, such as through scientific testing and/or governmental regulation.

The subject (or what constitutes the subject) is here defined by negative affirmation (the swimmer is not that wearing polyurethane suits). | **Excerpt 7**
"The other world record was set in a suit developed by Arena, who have called for Fina to take action. In an open letter published in yesterday's Daily Telegraph, Cristiano Portas, the Arena Group chief executive, said a "firestorm of publicly expressed concern has ensued about the alleged buoyancy advantage provided by Speedo LZR Racer and Tyr Tracer Light swimsuits". Arena want Fina to carry out tests on all new suits to ensure that competition remains fair. Portas said concerns about the suits must be addressed "in order to avert an irrecoverable loss of credibility just a few months before the Olympic Games". He added: "As a consequence, a reliable and transparent analysis of these materials, as well as a careful assessment of approval procedures, is urgent. Such action is in the supreme interest of the sport."
(New suit sparks costume drama – The Daily Telegraph, April 12 2008*)*

Excerpt 8
"the National Federation of State High School Associations has taken no action, noting **there is no scientific proof the suits provide a competitive advantage**. For the same reason, **a moratorium on the latest technical suits was lifted** in September by the National Collegiate Athletic Association."
(For amateur swimmers, the cost of success doesn't suit everyone – The Washington Post, November 9 2008*)*

Excerpt 9
"The international swimming federation, FINA, has rules about swimwear and the use of equipment during competitions. The rules say that googles are the only allowed equipment and that swimwear should respect norms of common decency. FINA has nonetheless allowed the use of these suits, as they mean they cannot be considered equipment, but swimwear. […] FINA has rules about: the breadth of the lanes, the allowed lane markers, the height of the starting platforms, the temperature of the water, and so on. Yet there are no rules for swimwear, besides those of common decency. **It could be an idea that FINA made rules about the type of textile allowed, the number of panels [the suit should be made of], the percentage of the body the suit can cover, the weight of the suit, etc.**"
[translated from Danish]
(Debat: Hvad skal vi med "Snydepelsen"? [Debate: What should we do of the "Cheat coat"?] – Jyllands-Posten, August 28 2000) |

*all emphasis in the excerpts is added

It suggests that agency is a not a "property of" either one of these categories, but it is intra-action (Barad 2003), a relational unfolding which defines the properties of subjects and objects, their different modes of being, and thus their constitution. This is an important contribution because it opens up for new possibilities of thinking about modes of being with(in) the material environment.

One such mode of being is the relation of identity consumers establish within their environments. Ferreira and Scaraboto (2016) demonstrate how identities are shaped in processes of object creation, and not only in moments of consumption of the finished object. Our study expands this perspective by suggesting that *things—*both objects and subjects—are never finished, but always becoming through their recursive relational material unfolding (see also Slater, 2014). It follows that consumer identity is not the product of inter-subjective interactions, but the result of repeated patterns of intra-actions between things that temporarily stabilize to form specific subject-environment configurations. Based on this insight, the task of future studies is to understand *how* these configurations gain or lose stability. For instance, how could materialization processes such as described in existing research disrupt the entity of a consuming subject? How do these processes stabilize subjects as composed of different material components? In the context of this paper for in-

stance, how can materialization processes disrupt the imagined purity of the swimmer as a body and restabilize the swimming subject as a combination of bodies, prosthetics and performance-enhancing drugs?

Furthermore, our study suggests that identity is but a particular configuration of a broader process of thingification establishing the relational boundaries between things while assigning them agency. The identified interruptions represent moments in which new possibilities of being come to the fore. While this paper theorizes thingification, much remains to be said about the specific dynamics within and between interruptions. Therefore, we invite future research to identify, among others, the range of possible actors and negotiations involved in interruptions within different context.

Making Sense of Foreign Markets Rejecting American Brands

Sarah Evans, Smith School of Business, Queens University, Kingston, Canada
Tandy Chalmers Thomas, Smith School of Business, Queens University, Kingston, Canada

INTRODUCTION

"Companies like Facebook have been praised as tools of free speech and political empowerment—aiding, for example, the Arab Spring uprisings that swept the Middle East last year. But the global companies operate under local laws, sometimes in jurisdictions that prevent users from saying things that would be legal to say in the U.S. and many other countries. The result is an ethical challenge for American companies that want to do business in such lucrative international markets without being complicit in efforts to stifle free speech." (Mavin 2012)

The above quote describes the conflict created when American cultural values, spread globally by companies, clash with the values of foreign countries. The spread of cultural values across the globe is ubiquitous (Tomlinson 1999). Since the emergence of the proverbial 'global village,' and amplified by social media, cultural values are shifting from one country to others through increasing travel, global awareness, multinational brands, and global media (Featherstone, Lash, and Robertson 1995). The challenge of exporting a brand is particularly difficult for products or industries that are strongly tied to ideological positions that do not necessarily translate across cultural boundaries (Holt 2002). Social media, for example, was founded on American values of freedom of expression, equality of access to information, and free democracy (Beetham 2004; Loader and Mercea 2011). As access to social media continues to expand globally, the American-born industry is confronted with some foreign countries' opposing values (Morozov 2010). Foreign countries with different cultural values, such as China, India, and Turkey, are demanding social media companies censor and block content that they think questions government power, threatens national security, endangers public safety, or violates moral norms ("A Rebuff to India's Censors" 2015; Alaimo 2016; Peker and Schechner 2015). Notably, these demands are from both governments and consumers, who work to flag content they view as inappropriate (Memarsadeghi and Atri 2014; Peker and Schechner 2015).

Consumer researchers have sought to understand this movement of cultural meanings by examining how the marketplace mediates cultural values permeating into other cultures. This work has articulated how native consumers come to accept and adopt (Üstüner and Holt 2010), adjust (Caldwell 2004; Grinshpun 2014; Ribke 2017), or, often with the support of religious and ideological narratives, reject foreign brands (Izberk-Bilgin 2012; Varman and Belk 2009). A shortcoming of extant research, however, is that it primarily focuses on the response to the brand in the new, foreign, market. This leaves open the question of what impact the rejection of a foreign brand in a new market has on consumers in the brand's home market? While consumer research has explored the narratives assigned to American corporations and industries by foreign cultures, it has not explored what happens when these narratives reverberate back to American culture. In this research, we thus seek to answer the following research question: How do domestic markets make sense of the rejection of their brands in foreign markets?

METHOD

To address our research question, we conducted an analysis of how American media describe foreign countries acceptance (or rejection) of industries founded on American cultural values. The context of this study was Facebook and its operations outside of North America. We chose this context because access to Facebook's services and consumption of its content is founded on American cultural values that may conflict with the values of some international communities across the globe (Helft 2010). A number of international communities have expressed their concern about the social network, have appropriated its services to bolster opposing cultural values, and have taken steps to block the platform from operating within their borders (Lakshmi 2012; Morozov 2010; Muggah and Thompson 2016).

The data in this study consisted of news articles about Facebook published between 2009 and 2019 in the top five American news sources. The search for these articles was conducted using the Factiva database. Of the total number articles published in the 10-year period (N=19,791), a stratified random sample of 600 were chosen reflecting the distribution of the articles over that time. The year 2009 was chosen as the starting date because it was the year Facebook officially became the most popular social networking site in the world (Arthur and Kiss 2010). We chose news media discourse analysis for this study because news media plays a critical role in shaping public discourse by presenting culturally legitimated frameworks for understanding events (Humphreys 2010). The articles were analyzed using grounded theory procedures (Charmaz 2006). This approach allowed us to assess variations in norms, values and symbolic meanings that are expressed in different cultures and the interrelations between them (Holt 1997).

FINDINGS

The analysis revealed that when reporting on foreign markets rejecting Facebook, the media used narratives to make sense of foreign markets' responses. In the sections that follow, we first describe situations where foreign markets reject American values, and then we detail how American media used three narratives to make sense of those rejections.

Foreign Markets' Response

Foreign countries rejected Facebook's American cultural values by publicly denouncing the intentions of the company, its underlying values, and its adherence to North American regulations and societal norms (Chang and Chen 2017; Sieff 2014). For example, the French president called on U.S tech companies saying, "The U.S. model is no longer sustainable because there is no political accountability" (Schechner 2018). Other countries, including Turkey, Iran, Afghanistan, and China for example, criticize the social media industry for exacerbating social issues rather than diminishing them. An Afghan government official publicly stated, "This is indeed against ethics, democracy, patriotism, Islam and national unity" (Sieff 2014). Other countries, like India and Russia, also reject Facebook and its American values by blocking access to the platform claiming its services enable users to post things that directly violate political and cultural norms ("A Rebuff to India's Censors" 2015; Hauslohner 2014).

Domestic Market Reaction

American media made sense of foreign markets' rejection of Facebook using three narratives (See Figure 1). These narratives conceptualize the conflict by pulling elements from areas of moral reasoning, multiculturalism, and reflective thinking. Each of these

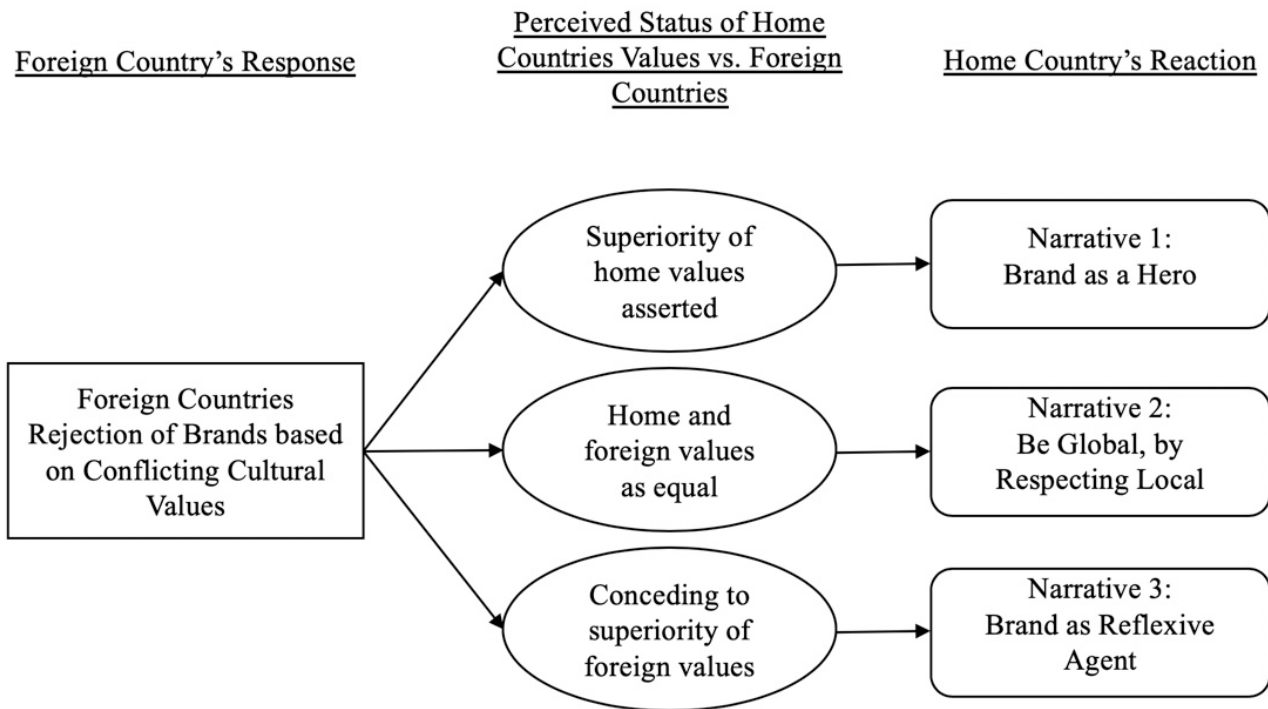
Foreign Country's Response   Perceived Status of Home Countries Values vs. Foreign Countries   Home Country's Reaction


Figure 1: Findings Overview

narratives also correspond to an assumption about the status of American cultural values in relation to the values of other countries. Together, these narratives make up the combination of stories American media told when reporting on the criticism Facebook was receiving from the international community.

Narrative 1: Social Media as an American Hero. The first narrative used to make sense of foreign markets rejection of Facebook relies on the classic trope of framing Facebook as a protagonist/hero and the foreign market as the antagonist/villain (Giesler 2008; Luedicke, Thompson, and Giesler 2010). American media made sense of Facebook being vilified by defending the social media industry and asserting that American values of freedom of expression and equal access to information 'save' consumers from the oppression and abuse of foreign corrupt governments. One journalist wrote, "In the end, it's the frightened reaction of states themselves that turns social networks into such heroes and bogeymen" (Tosser 2011). Similarly, another article framed Facebook as the force that helps defeat authoritarian regimes: "We've all heard how social networks such as Facebook help to spread democracy around the world by mobilizing the masses and making it easier to topple dictators" (Moyo and Onishi 2016).

By asserting a protagonist role, this narrative implies that American's cultural values are superior to those of other countries. Like Thompson and Arsel's (2004) use of the Trojan Horse metaphor, Facebook is described as a tool that enables activists to question their countries' societal norms and keep their governments accountable; thus, reflecting a more authentic, democratic, and colonized society. This was particularly true of less developed countries where citizens are characterized as duped, unaware, uneducated, or simply lacking civic engagement (Izberk-Bilgin 2012; Murray and Ozanne 1991). By asserting a protagonist or hero role, the narratives assumed the superiority of American's values inherent in the service over those of other countries.

Narrative 2: Be Global, by Respecting Local. The second narrative used by American media framed foreign protests against

Facebook as worthy of representation. In this narrative, the solution to the conflict was for Facebook to accommodate the diversity of values attached to the company in other cultures. Facebook and America avoid confrontation by relinquishing power over the company's values so that foreign countries can make content decisions for themselves. For example, one article discusses Facebook's new project of creating censoring software to be used by third parties in foreign countries saying, "The project illustrates the extent to which Facebook may be willing to compromise one of its core mission statements, 'to make the world more open and connected'" (Isaac 2016). The American media shows empathy towards the industries' complex situation, describing the company's accommodation of other cultures as something they must do: "These challenges become even more complex in a global context in which moderators must account for different languages and slang; for different historical, cultural and political divides; and for different power structures — all of which might color the social meaning of the speech" (Klonick and Kadri 2018). The CEO of Facebook supported this position: "I don't think that we, sitting here in California, are best positioned to know what the norms in communities around the world should be. At some point, you just need a more dynamic system where people can just express that themselves" (Isaac 2017).

With this narrative, the assumption is that foreign cultural norms and values are equal to American cultural norms and values. In this sense, American cultural values are not assumed to be superior, as they were in the 'Social Media as Hero' narrative. In this narrative, American media does not place cultural values on a hierarchy of least to most legitimate. Instead, they argue that the way for Facebook to be a global company is to respect and accommodate all cultures equally.

Narrative 3: Social Media as a Reflexive Agent. The third narrative used in American media was framing the social media industry as a reflexive entity willing to change for the better. Rejection was treated as a sign that Facebook should turn inward and examine whether its American values and practices were serving the great-

er good. One article compares the values of Facebook in America to those in Europe, justifying the American version's need to improve on things such as providing universal access to information and building social systems that promote constructive conversations (Pegoraro 2018). On these issues, a European official states, "The U. S. government may not lead on those issues, but the European Union seems prepared to." (Pegoraro 2018). Quotes like these demonstrate American media's receptivity to the success of different cultural values attached to Facebook. Articles also report the decreasing support for Facebook's original values within America, acknowledging how, for example, freedom of expression increases opportunities for the spread of misinformation. Consider this quote about the conflict between Facebook's policy allowing ads containing misinformation and consumers' demands for censorship of these ads: "We should know better than to demand of Facebook's leaders that they do what is not in the best interests of the company. Instead, citizens should demand effective legislation that can curb Facebook's power" (Vaidhyanathan 2019).

This narrative in American media makes sense of foreign countries rejection of Facebook's inherent American values by seeing it as opportunity for self-reflection and improvement for the company and the country. Like the second narrative, it does not assume American's values are superior to those of other countries; however, it does not assume they are equal either. Rather, America's interpretations of the industry are seen, in some ways, to be inferior to the interpretations in foreign countries. This narrative places Facebook, and its American values, beneath those of other cultures by acknowledging they may not always be for the greater good.

DISCUSSION

The goal of this study was to explore how American media makes sense of foreign countries rejecting brands based on American cultural values. We show that the media utilized three narratives that represent different ways of interpreting the disapproval which contained different assumptions about the relative status of American versus foreign cultural values.

The 'Social Media as Hero' narrative reflects previous research showing how consumer groups reject the antagonist role by flipping the narrative and asserting a protagonist role (Giesler 2008; Luedicke et al. 2010). We extend this work by showing how this narrative flip is used to make sense of conflicts between consumer groups across countries, and not just within them. Moreover, this narrative bolsters the view that American's values are superior. The 'Be Global, By Respecting Local' narrative adds to previous research showing how vilified consumer groups manage this perception (Carducci 2006; Giesler 2012; Kozinets and Handelman 2004; Ribke 2017). While prior work shows that vilified consumers try to avoid explicit confrontation with those in disagreement (Thompson and Arsel 2004b), we show that media uses a narrative that detaches the brand from the conflict by accommodating for all cultural values (Veresiu and Giesler 2018). The 'Social Media as Reflexive Agent' narrative argues that the solution to foreign criticism was for social media companies to turn inward and reflect on whether and how they can use these responses as constructive criticism to improve their practices. This finding expands previous work on what it means for consumer groups to renounce their support for controversial values in the marketplace (Thompson and Arsel 2004a).

At the theoretical level, these narratives demonstrate a range of perceptions about the status of American cultural values in relation to foreign cultural values. This range changes how we think about the effects of multiculturalism at the global level. In this study, we show how assumptions of American culture's inferiority, or superiority, to other cultures in the marketplace stems from American culture itself and the narratives perpetuated by media. We also show how American's perceptions of their inferiority spurs narratives about the need to change within their own market. The 'glocalizing' of Facebook in foreign markets thus not only changed the meaning of the company within the boundaries of foreign markets (Caldwell 2004; Thompson and Arsel 2004b), but it encouraged the exploration of changes to its values in its home market. This expands our understanding of what it means for a brand to be truly multicultural at the global level. The changes in values global brands undergo in foreign markets do not happen in isolation. Global brands are receptive to the reverberation of those changes; thus, encouraging them and their domestic market to reconsider their original values in hopes of changing them for the better.

This research has numerous implications for market practitioners, policy makers, and individual consumers. This research will assist market practitioners, in the technology and social media industries, with adopting a broader view of their roles across countries and cultures. This research will assist public policy makers with determining the right level of regulation to keep social media companies, like Facebook, accountable when they fail to uphold cultural values. This new area of regulation is essential to setting a foundation for the future of the global technology industry.

Healthy Mind on Sale: Conflicts in the Legitimation Process of Social Media Influencers

Daniela Ferreira, Federal University of Rio de Janeiro, Brazil
Paula Chimenti, COPPEAD Institute of Administration - Federal University of Rio de Janeiro, Brazil

INTRODUCTION

Social media influencers (SMIs) can be defined as individuals, some of whom previously anonymous to the general public, who manage to expand their voice and their influence on other people—a phenomenon McQuarrie, Miller, and Phillips (2013: 136) call the "megaphone effect". Judgments related to SMIs are controversial. On the one hand, they are considered a more convenient source of information by their followers and more reliable than traditional marketing campaigns (Brooks and Piskovski 2018; Evans et al. 2017), especially when they craft authenticity for themselves (Audrezet, Kerviler, and Moulard 2018). On the other hand, studies have suggested that following influencers in social media may generate or increase symptoms of depression and anxiety (Lup, Trub, and Rosenthal 2015). Among so many options of SMIs to choose to follow and trust, legitimacy becomes a key aspect.

Legitimacy is a collective construction (Johnson, Dowd, and Ridgeway 2006) of social reality and refers to the "perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions (Suchman 1995: 574)". To fully understand the legitimacy process, it is important to consider the concept of institutional logic, which is a broad set of beliefs that defines the boundaries of a field, acting as a guide for practical actions (Thornton, Ocasio, and Lounsbury 2012). Institutional theory (Meyer and Rowan 1977) points that consumer perceptions and judgments about an entity influences its legitimacy (Hakala, Niemi, and Kohtamaki 2017). It is worth mentioning that contrasting institutional logics within the legitimation process of an entity may harm its legitimacy (Rao, Monin, and Durand 2003).

In this study we adopt Suchman's (1995) conceptualization of legitimacy with three dimensions: pragmatic, moral, and cognitive. Pragmatic legitimacy is related to the benefits perceived by the public, usually involving direct exchanges between the legitimized entity and its public. Moral legitimacy is based on the public evaluations about whether the entity is in line with specific social norms and values. Cognitive legitimacy depends upon actions that simplify and help the public to understand the entity and even 'take for granted' (Humphreys 2010a) its existence. High levels of pragmatic, moral, and/or cognitive legitimacy may be fundamental for the success of an entity, while lack of legitimacy can lead to less social support (Scott 2014). It is important to notice that legitimacy is essentially a social evaluation made by others, who may generate positive or negative effects on one's legitimacy (Bitektine and Haack 2015). According to Castelló, Etter, and Nielsen (2016), prior research tends to neglect the impact of power relations between actors involved in the legitimacy process.

This paper extends research on legitimacy by addressing the tensions involved in constructing legitimacy for the SMIs. Our research context is the social media platform Instagram, specifically profiles focused on mental health content–that is, psychiatrists who have become influencers. The choice of mental health content was due to the importance of this subject for social well-being. According to the World Health Organization (WHO 2019), mental disorders affect 700 million people worldwide, representing 13% of all existing diseases.

Social media has made it possible for professionals from different areas to establish direct and interactive contact with their audiences. However, this brings issues to be considered, especially involving a delicate subject such as mental health, as it may blur the boundaries of the relationship between psychiatrist and patient. There is a considerable risk of dangers for violating patient privacy and spreading information that could negatively influence the therapeutic relationship (Banerjee and Bespalova 2019). Since mental disorders can lead to severe personal and social consequences, there seems to be an important ethical issue regarding disclosing misleading medical information or even commercializing courses and treatments through profiles on social media platforms. According to the American Psychiatric Association (APA 2017: 11), psychiatrists should be aware of the "potential challenges to sound and ethical practice" in using social media for providing patient care.

Thus, considering the social media influencer psychiatrist (hereafter referred to as SMIP), we seek to answer the following questions: 1. Who are the actors involved in the construction of legitimacy for him/her; 2. What roles does each group of actors play?; 3. What are the tensions that permeate the process of constructing and maintaining this legitimacy? We believe that a contextualized study of the tensions involved in the construction of legitimacy of SMIP can provide a richer understanding about how legitimacy unfolds in social media.

CONCEPTUAL FRAMEWORK

This study uses Institutional Theory (Meyer and Rowan 1977) as a theoretical lens, especially the concept of legitimacy (Scott 1995, Suchman 1995). Institutional Theory considers that society exists in a context of institutional logics, which promote stability and meaning for people's behavior (Scott 2014). Institutions may be defined as shared systems of meanings comprised in discourses (Phillips, Lawrence, and Hardy 2004).

As seen, legitimacy is a fundamental concept in Institutional Theory, as it is by gaining legitimacy that institutions are strengthened and perpetuated in society. According to Hybels (1995: 241), "where legitimacy is the attitude of people toward a persistent aspect of society, (…) an institution is that aspect itself." Although legitimacy can be an asset that belongs to a certain social entity–an organization, brand or individual, it is ultimately a social evaluation made by others (Bitektine and Haack 2015). Suchman (1995: 574) highlights the collective essence of legitimacy, arguing that "when one says that a certain pattern of behavior possesses legitimacy, one asserts that some group of observers, as a whole, accepts or supports what those observers perceive to be the behavioral pattern, as a whole."

Studies on legitimacy have long been conducted in the field of general management and have typically focused on how a firm builds legitimacy (Suchman 1995). A significant development of the issue occurred in the mid-1990s, mainly with the works of Scott (1995) and Suchman (1995), and interest in the topic has increasingly grown in the marketing field. Previous studies within this field have investigated the legitimation process of a diverse array of entities or "social objects" (Johnson et al. 2006: 19), such as markets (Giesler 2012; Press and Arnold 2011; Humphreys 2010a, 2010b; Humphreys and Latour 2013), consumption practices (Barnhart and Huff 2018; Sandikci and Ger 2010), brands and brand communities (Hakala et al. 2017; Hu et al. 2018; Kates 2004), products (Wilner and Huff 2017), marginalized consumers (Coskuner-Balli and Thompson 2013; Scaraboto and Fischer 2013), marketing practices

(Ardley and Quinn 2014; Lillqvist, Moisander, and Firat 2017), and companies (Handelman and Arnold 1999; Humphreys and Thompson 2014). Overall, scholars have agreed that communication and media are fundamental to building legitimacy (Bansal and Clelland 2004; Bitektine 2011), yet there is still a lack of knowledge about how the legitimation process occurs on digital platforms (Hakala et al. 2017; Humphreys and Latour 2013) despite the omnipresence of social media in peoples' lives.

Notable exceptions are the studies of Scaraboto and Fischer (2013), Hakala et al. (2017) and Lillqvist et al. (2017). Scaraboto and Fischer's (2013) qualitative study of plus-sized consumers of fashion reveals the process through which this stigmatized group of consumers build legitimacy. The authors followed the online interactions of bloggers and their audiences and their results showed that plus-sized consumer mobilization occurred through identifying with other consumers and institutional actors who have more agency in the field and established new institutional logics. Hakala et al. (2017) investigated how online community practices contribute to building brand legitimacy. Using netnography and discourse analysis, the authors concluded that the legitimization practices in an online community embraces the perceptions, judgements, and actions of the consumers involved. These practices, associated with the actions of the brand's owner and prior collective legitimacy judgements (within the online and offline brand community), shape consumer perceptions and judgements regarding the brand. Finally, Lillqvist et al. (2017) studied how consumers challenge the marketer's legitimacy within an online community website. Through qualitative research, the authors concluded that consumers confer legitimacy based on socially shared legitimacy criteria and challenge the marketer's legitimacy when its activities are in conflict with those criteria.

Despite the relevant contributions these scholars have made toward understanding the legitimation process within the social media context, scant attention has been given to the tensions and conflicts between the different actors involved. We argue that, as social media is an arena that embraces so many different opinions and conflicts (Sood, Churchill, and Antin 2012), enabling "harsh disputes, incivility, and sarcasm" that "polarize opinions and beliefs (Kozinets, Gambetti, and Biraghi 2018: 414)", it is fundamental to consider the tensions in building legitimacy in this context. Furthermore, prior research on legitimacy has not examined the SMI phenomena. Studies on SMIs usually focus on how their personal endorsement of products and brands impacts consumers attitude and shopping intentions (e.g. Schouten, Janssen, and Verspaget 2020, McCormick 2016, Tomas, Meschgrahw, and Alcantara 2012) and they lack accounts of the perception and judgment of consumers about the legitimacy of the SMI himself/herself. Given the increasing relevance of SMIs in the lives of consumers (Evans et al. 2017), this study intends to bring new nuances to understanding legitimacy within the social media context.

METHOD

To address the research questions, we conducted an 18-month netnography (Kozinets 2019) carrying a structured observation of three psychiatrist Instagram profiles and focused search and download of data from September 2018 to February 2020. We followed online interactions by reading and archiving posts, comments, videos ('stories' and 'lives'), and kept notes in immersion journals recording our ongoing investigation and theory development. The profiles were chosen based on popularity (from 350,000 to one million followers on Instagram) and frequency (at least one post and/or video per day). Around 2,100 posts, 17,100 comments, and 80 hours of video were analyzed.

The collected data was subjected to a content analysis for coding and condensing the material, and for identifying patterns. Following Bardin's (2013) recommendation, content analysis was carried out in three stages, namely: 1. Pre-analysis, which involved an initial reading of the data in order to systematize the main ideas and excerpts contained in the material while identifying the actors involved in the legitimation process; 2. Exploration, when the raw data was coded and subsequently the coded elements were classified. The definition of the analysis categories was also based on the theoretical framework of the research, moving from data to theory and from theory to data; 3. Inference and interpretation of the results, aiming at a reflective and critical discussion of the material based on hermeneutic interpretation (Thompson 1997) with interactive movements between the intra and intertextual cycles.

Regarding research ethics, we followed Kozinets' (2019) most recent recommendations. All data was collected from profiles that define their privacy setting as public. When presenting the data collected, some original words were modified without, however, changing the meaning of the sentences. In addition, names and identification details of the SMIPs (therefore referred as SMIP1, SMIP2 and SMIP3) and their followers were kept confidential. These procedures seek to ensure that quotes and people cannot be easily tracked.

DISCUSSION

Drawn on the premise that the legitimation process is influenced by the legitimizing entity itself, but is ultimately originated by the audience (Bitektine and Haack 2015), we first identified the main activities of the SMIPs in the social media platform Instagram, namely: 1. to provide free content through posts and videos about mental health issues; 2. to perform thematic live sessions on subjects demanded by their followers; 3. to sell products, such as face-to-face courses, handouts with promises of healing, participation in private groups on WhatsApp, among others, always emphasizing the exclusivity of these products; 4. to interact with comments made on their posts, encouraging followers to engage by asking questions and proposing controversial topics to be discussed; 5. to repost complimenting posts/videos from prominent followers who have verified accounts.

Most of the free content made available by SMIPs are on how to overcome mental health disorders in the short-term with easy to understand tips to be adopted on a daily basis. Often presented as a call to action, expressions like "take a cold shower in the morning" or "give alms to beggars everyday" are highlighted by SMIPs, either in post using capital letters or through an increase in the tone of voice in the videos. SMIPs, based on a utilitarian vision, act as mentors in the cluttered information context of social media. In this way, complex mental health issues, such as controlling depression, are presented in a simplistic way, often packaged in online classes:

> In my online class on 'Depression and Lack of Energy' you will learn how to relieve depression with just proper food and supplements. Antidepressants are not always the best option. Medications have undesirable side effects in the long run. In my class, there will be tests and practical exercises to guide you in having a better and more productive life and to avoid wasting time and unnecessary efforts. It is done by someone who is an expert: Psychiatrist graduated from [University's name] and PhD in Psychiatry from [University's name] (SMIP2).

> Cold bath is one of the most expressive medicines in the world. It brings countless physical benefits: it is anti-inflammatory, increases testosterone, strengthens immunity... But the mental

benefits are even greater: resilience, courage, pain control, self-confidence. Why do I say this? Because everything I say here has been previously tested and can be reproduced by anyone (SMIP1).

We can see three legitimacy strategies in this example, which are recurrent in other SMIPs posts. First, there is a comparison between what is being offered in the course and traditional treatments, highlighting how much simpler and more practical the course is. This strengthens SMIP's cognitive legitimacy by helping the public to clearly understand what they offer. It also enhances practical legitimacy, as it clarifies the benefits that can be achieved through the course and gives a sense of pragmatism. Finally, there is the mention of academic titles, as a way of reinforcing SMPI's moral legitimacy.

Whether in courses or in the free content offered, SMIPs use distinct communication styles to affect people's perception of legitimacy (Handelman and Arnold 1999), adopting an aggressive, technical, or affectionate discourse whenever is convenient. Many times, aid is coated with aggressiveness as a way of demonstrating intellectual superiority: "You are lazy, get up from the chair and do something useful (SMIP1)."; "Do not assume a mediocre life like yours before doing what I am going to teach you (SMIP3)." Other times, there seems to be an effort to express humility and proximity with the followers: "Thank you for helping me to form this strong community, thank you for all the love you give me. I don't deserve it, but I appreciate it (SMIP1)." These discourses act as a rhetorical and legitimating strategy to preserve the SMIP's influence, as Ardley and Quinn (2014) found in the marketers' discourse they analyzed.

Legitimation Process: Defenders and Critics

Since legitimacy is a collective construction (Johnson, Dowd, and Ridgeway 2006) where there are interactions between various groups of participants (Lawrence and Phillips 2004), to fully understand the legitimacy process of SMPIs we've identified the key actors involved. We separated them in two groups: the 'defenders' and the 'critics' and focused on the content they produce based on the three dimensions of legitimacy postulated by Suchman (1995).

Defenders are consumers of the content produced by the SMIPs and advocate them with testimonies, often personal, about the impact of the SMIPs on their lives:

I tried to commit suicide, but then I started to follow your profile, bought your handout, and my life changed... just like that! Why bother going to a therapist when I can learn from you how to overcome my depression?

We divided defenders into three categories: ordinary followers, face-to-face followers (who have attended an in-person course given by the SMIP), and prominent social media influencer followers. It seems to be a hierarchical line between these groups, the latter being the most valued one, followed by the face-to-face group of followers. In this sense, some actors have more power than others in conferring legitimacy (Deephouse 1996; Meyer and Scott 1992). SMIPs often repost complimenting posts/videos about their courses and their content in general from prominent followers who have verified accounts. Face-to-face followers are valued as people closer to SMIP and seek to express their prestige on comments: "I feel so lucky that I had the opportunity to attend his in-person course. The contact with him really touches our heart! When you are there, seeing him face-to-face, his words have much more impact." These two groups–prominent SMI followers and face-to-face followers–seem to act as social reference groups that contribute to strengthen the

SMIP's legitimacy, facilitating the consumption of the SMIPs content by the defenders in general (Hakala et al. 2017).

The critics are the ones who refute defenders' arguments and are divided into three categories: offenders, empathetic, and rule advocates. Offenders often use aggressive arguments related to the SMIPs character and ethics: "I keep asking myself how come this guy attended a medical school and at the end turned out to be THIS. He is an incapable professional, and that's why he needs social media to earn money." The group of empathetic, although disqualifying the SMIPs, show concern for defenders, sometimes assuming a patronizing posture towards the latter:

What really concerns me when I see so many people following a guy like him is realizing the lack of opinion and self-esteem of these people. They end up using this guy as a pillar for something in their lives, what shows how lost they are.

Finally, advocates of rules resort to existing rules, norms and laws, sometimes even commenting that they have reported the SMIPs to their professional council and/or to the social media platform management.

Both defenders and critics play an active role in the legitimation process of the SMIP (Humphreys and Latour 2013). The dominant strategy of defenders is pragmatic legitimacy, and metaphors such as "lighting", "rebirth", and "rescue from the dark" are often used. On their comments, the benefits originated from following the SMIP is often emphasized:

I took a gun and left home determined to kill a guy, but then your words came to my head and I gave up and went home. You've changed my life. I saved my marriage and now I live as a responsible person.

Moral legitimacy is also enhanced by defenders. Drawn on institutions such as universities, science and professional associations, which are often already legitimized within society, defenders refute criticisms by emphasizing the authority of the SMPI on mental health issues:

He is a REAL doctor, member of the [professional association], he has a profound knowledge in Psychiatry, unlike you. He doesn't post his own truth; he posts the truth from published scientific research on mental disorders. Numbers are not a questionable truth.

Critics often use arguments based on cognitive legitimacy to delegitimize SMIPs: "It makes no sense to call these people [followers of SMIPs] into reality, as this is a cult of personality. The followers are mainly fragile and vulnerable and adhere to this cult." Critics in the group of advocates of the rules also use arguments based on moral legitimacy. Like the defenders, but in the opposite way, they resort to institutions, such as medical associations, to question the validity of SMIPs practices. They also threaten to denounce SMIPs, accusing them of "illegal practice of medicine", as one of the critics posted: "Reporting this profile to Instagram is important because he [SMIP] has no ethics and does not act as doctors should act."

Defenders can be aggressive and refractory to critics, not only to reinforce the SMIP legitimacy, but also because, by doing that, they are also seeking to legitimize their own consumption practices (Humphreys 2010a, 2010b), which critics seem to despise:

You have an army that wakes up daily ready to fight and defend you, doc! What you lead here is something that is changing the

world, our world, and I am so grateful to be part of it. If you [critics] have nothing nice to say, you should as well shut up. Don't come to this profile to say these stupid things, you don't know anything, you are a nullity, your life is worthless.

SMIPs seek to reinforce their legitimacy by legitimizing the defenders ("Together we are stronger, a great big family") and diminishing the critics, often attacking them directly and not their arguments. For instance, one of the SMIPs of our study, when asked by a follower what he thought of people who thinks differently from him, replied: "I don't know, I don't care, they [critics] are stupid, stingy and uninformed, they don't study at all and they don't know people who are making history. Those are irrelevant opinions. (SMIP1)"

Our analysis reveals that two institutional logics are at play in this context. Defenders judge that SMIP's activities are embedded in a professional logic related to expertise, competence, and responsibility, while critics judge that SMIPs activities are embedded in a market logic related to maximizing their own benefit. One of the defenders, for example, mentioned that the SMIP he follows "has more wisdom than all the teachers in my University combined." Other reinforced that the SMIP "could be earning a lot of money but, instead, is giving all the knowledge he has acquired in his career in order to help changing people's life for free." Critics, in turn, point out that the main objective of the SMIPs is to earn money out of their followers, as one of the critics stated: "this guy [SMIP] is dishonest and even dangerous. He just wants to earn money from foolish individuals, he is a shame for his profession. I wouldn't even call him a professional." SMIPs seem to alternate their discourse between the two logics, sometimes stating that they are not there for money, but "to make a difference in people's lives", while other times making comments similar to an advertisement ("We have few openings for my face-to-face course. Don't miss this opportunity and sign up now!").

Tension and Network Effect

These contrasting institutional logics (Rao, Monin, and Durand 2003) within the legitimation process lead to tension, that tends to generate a network effect, which describe the network value increase or decrease to any given user due to the number of other users with whom they can interact (Eisenmann, 2007). This effect, in turn, increases the impacts of defenders and critics in the legitimation process, since it amplifies their voices within the social media environment, creating a buzz that drives participation. For instance, posts where critics make comments have far more engagement than others. Statements from critics also tend to go beyond the SMIP's profile and can be found in many other profiles where they create a tension of contrary arguments.

Through our findings we construct a proposed model to help understand the legitimation process of SMI (Figure 1). The judgments and actions present in the model are examples that can be adapted to different types of SMIs.

CONCLUSIONS

Our study makes two contributions that go beyond prior research. First, by better understanding the process through which SMIs acquire legitimacy, we can understand how the tension provoked by competing logics can enhance legitimacy sources' voices, whether they are positive or negative. As seen, previous research tended to focus on judgments and actions pro-legitimation, and the existence of strategies of delegitimating and logic tensions between actors have been little explored. Second, we propose that network effects amplify the SMIs reach and influence and that both critics and defenders contribute to these effects, therefore actively influencing the legitimation process.

Is Effort Required by a Green Behavior Always Negative? The Moderating Effect of Male Gender Identification Strength

Constanze Gathen and Sandra Praxmarer-Carus, Universität der Bundeswehr München, Germany

INTRODUCTION

According to the principle of least effort, humans tend to avoid behaviors that require effort (Hull 1943). This research defines effort as a property of an activity or a product which determines the amount of labor that will be required to perform the activity or to generate utility from the product (Gibbs and Drolet 2003; Inzlicht, Shenhav, and Olivola 2018). Studies demonstrate that the effort necessary to carry out an activity acts as a barrier for performing that behavior (McKenzie-Mohr 2000). Consistently, Ludwig, Gray, and Rowell (1998) demonstrate that reducing effort increases the behavior's attractiveness. Therefore, a relevant recommendation to public policy makers who aim at motivating individuals to perform certain behaviors would be to reduce the effort that the behavior requires (Van Houten, Nau, and Merrigan 1981). However, many prosocial and green behaviors demand a significant amount of effort that is impossible to eliminate. Examples include household waste separation and picking up trash. As motivating individuals to perform such behaviors is valuable to society, it is necessary to understand the effects of the effort that such behaviors require. While the negative effect of effort is self-evident, few theories suggest that required effort may also increase the attractiveness of a behavior. This research aims to contribute to a clearer understanding of the potential positive effects of effort.

The literature has identified few positive effects of effort on the attractiveness of a behavior and has examined few moderators. Effort can positively affect the perceived quality and value of a product (Kruger et al. 2004; Mochon, Norton, and Ariely 2012) and determine how effective (Schunk 1983) and meaningful (Olivola and Shafir 2013) individuals perceive an activity to be. Furthermore, individuals with a high need for achievement actively search for challenges (Johnson and Perlow 1992), and Cutright and Samper (2014) demonstrate that individuals' perceived control over the outcome of a behavior affects how much effort they are willing to take. This research explores an additional effect of effort that the literature has not examined. We propose that the effort that a behavior requires may increase the perceived masculinity of that behavior and we argue that this potential effect may be highly relevant in the context of green behaviors.

Borau, Elgaaied-Gambier, and Barbarossa (2020) and Brough et al. (2016) demonstrate that individuals perceive green behaviors to be feminine. This perception can deter men from engaging in such behaviors (Brough et al. 2016). In line with this, Brough et al. (2016) find that presenting green behaviors in a more masculine way increases their attractiveness among men. We argue that emphasizing the effort required for a green behavior may make the behavior more masculine and therefore more attractive to men. We propose that male consumers' gender identification strength moderates the effect: when gender identification strength is low, the required effort has a negative effect on the attractiveness of the behavior; when male gender identification strength is high, the required effort makes the green behavior more attractive to consumers in comparison to without effort. We propose that the perceived congruence between the individual's self-concept and the proposed behavior mediates the effect. We report an experiment with male consumers. We provide implications for social marketers, green product marketing, and public policy makers.

THEORY AND HYPOTHESES

The negative effect of required effort on product attractiveness

Several studies support the principle of least effort and demonstrate that an option that requires more effort is less attractive than an option that requires less effort (Hull 1943). In the context of green products, for instance, Joshi and Rahman (2015) observe that consumers strive for convenience. As required effort causes consumers to invest time and energy and reduces one's free capacities, it is highly intuitive that effort reduces a choice's attractiveness (Steg and Vlek 2009).

Cutright and Samper (2014) report that individuals may prefer high effort choices versus low effort choices when they are able to observe timely progress towards achieving a goal. However, when fast progress is unlikely, individuals prefer low effort to high effort. The latter situation is typical for green choices because consumers often feel that their choice only has a small impact on the environment and real progress requires long-term and collective work. Thus, effort should decrease the attractiveness of green choices. We propose:

Hypothesis 1:   *Effort that a green product requires by the user has a negative effect on product attractiveness.*

Figure 1 illustrates the effects that this paper examines.
Figure 1: The Effects of Effort and the Hypotheses (H1, H2, and H3) of this Research

The moderating effect of male gender identification strength on the effect of effort on product attractiveness and self-congruence as mediator

We argue that emphasizing the effort required by a green behavior may make the behavior more masculine and therefore, more congruent with male consumers' self-concept. The perceived congruence between a behavior and the consumer's self-concept is a major determinant of consumers' choices (Malär et al. 2011). Thus, self-congruence should mediate the effect of effort on the attractiveness of that behavior.

Furthermore, we argue that male gender identification strength (GIS) moderates the effect of required effort on the perceived congruence between a green behavior and the male consumer's self-concept. The literature demonstrates that **individuals'** gender identity is a **substantial part of their self-concepts (Fischer and Arnold 1994) and defines it as "the** importance or centrality of gender group membership to one's overall self-concept" (Bosson and Michniewicz 2013, 427). We explain the moderating effect of male gender identification strength as follows. First, effort is associated with being capable, physically active, and forceful (Mochon et al. 2012), and these characteristics are associated with masculinity (Holt and Ellis 1998). Effort also relates to an individual's need for achievement and may empower them (Cutright and Samper 2014), both of which are positively related to perceived masculinity (Lobel and Agami-Rozenblat 1993). Thus, individuals should perceive a behavior (or product) that requires effort as more masculine than a behavior (or product) that does not. Secondly, the more relevant gender identity is for a male consumer, the more it influences his self-concept. When gender identification strength is high, being a man is the central reflection of the consumer's self-concept. (Bosson and Michniewicz 2013). When gender identification strength is lower, the male consumer's self-perception focuses less on his gender and instead considers other characteristics, such as his values and interests. Thus, the more relevant male gender identity is to a consumer the more the perceived masculinity of a product should determine the perceived congruence with that product. Concluding, effort that we assume to increase the perceived masculinity of a green product should particularly increase the perceived congruence with the consumer's self-concept when masculinity is the crucial part of their self-concept, that is, when gender identification strength is high. We propose:

Hypothesis 2: *Gender identification strength moderates the effect of effort on the perceived congruence between a green product and the male consumer's self-concept. With increasing male GIS effort compared to no effort increases the perceived self-congruence.*

Because the perceived congruence between a behavior and the consumer's self-concept is a major determinant of consumers' choices (Malär et al. 2011), we propose:

Hypothesis 3: *With increasing male gender identification strength, effort (compared to no effort) makes a green product more attractive, instead of less attractive, to consumers. Perceived self-congruence mediates the effect.*

STUDY

Design and stimuli

Our experiment (green product requiring effort vs. green product not requiring effort) used advertisements for a green heating system. Participants were randomly assigned to one of the advertisements. The ads described the advantages of the green, wood-burning heating system. The "no effort" version did not mention any effort for the user. The "effort" version either explained that the user must layer the firewood in order to allow the system to automatically transport it into the boiler, or explained that the user must split pieces of the firewood in order to make it the right size for the boiler (time requirement in both cases: 15 minutes per week). We used two versions of effort in order to avoid that consumers may like or dislike a specific effort. The analyses did not show differences between the effects of the two effort types and we combined them into one "effort group".

Participants

Four hundred fifty-six male respondents participated in the online experiment. Seventy-seven participants did not respond correctly to a control question. We excluded them from data analysis because they had not read the information provided. The final data set consisted of 379 males. Eighty-seven percent were students and their mean age was 22.

Measures

We measured green consumer values (Haws, Winterich, and Naylor, 2010) with four items like "I am willing to actively do something for the environment" (1 = fully disagree; 7 = fully agree). We measured gender identification strength (Bosson and Michniewicz 2013) with the following items: "Being a man is the most important reflection of who I am" and "Being a man is important to me" (1 = fully disagree; 7 = fully agree). Next, we included a filler task to draw the participants' attention away from the previous topics. Before seeing one of the advertisements, we asked participants to imagine that they were going to buy or build their own home and that they were looking for a heating system. After ad exposure, we measured the perceived attractiveness of the green product with the following items: "How attractive is this heating system to you?" (1 = highly unattractive; 7 = highly attractive) and "How likely are you to look for additional information about this heating system?" (1 = very unlikely; 7 = very likely). Furthermore, we measured the congruence between the participants' self-concept and their perception of the heating system (Malär et al. 2011). The items were: "This heating system is consistent with how I see myself", "Heating with this heating system is consistent with how I see myself", and "This heating system is consistent with the person I would like to be" (1 = fully disagree; 7 = fully agree). In addition, we measured perceived masculinity of the product (7-point rating scale).

Data analyses and findings

Cronbach's Alpha of the green consumer values was .87, the correlation of the gender identification strength-items was .67; Cronbach's Alpha of the three congruence-items was .89, and the correlation between the two dependent attractiveness-variables was .80. Thus, we aggregated the respective items. Participants perceived the products that required effort to be more masculine than the product with no effort (no effort: 3.86; effort: 4.13, p = .068).

We used Process Model 7 (Hayes 2018) to test our hypotheses. The independent variable was the manipulated effort (no effort vs. effort). The perceived attractiveness of the product was the depen-

dent variable. Perceived self-congruence was the mediating variable and gender identification strength (Male GIS) was the moderator. We included green consumer values (Green values) as a covariate, because it affects consumers' green behavior. Table 1 illustrates our findings.

Test of hypothesis 1. The second model of table 1 demonstrates a significant negative effect of effort on product attractiveness (-.241, $p = .048$). The findings support hypothesis 1. In line with the principle of least effort, an effortful choice is less attractive than a choice without effort.

Low	5.13 (2.12)	4.71 (1.76)	
Moderate	5.38 (1.46)	5.03 (1.56)	
High	4.97 (1.97)	5.44 (1.35)	

Please note:	** p < 1%	* p < 5%

Test of hypothesis 2. The first model of table 1 shows that effort has a negative effect on perceived self-congruence (-.995, $p = .02$). This finding makes sense because humans tend to value efficiency (Payne, Bettman, and Johnson 1993) and should therefore perceive a product requiring effort as less congruent with their self-concept than a product that does not. As expected, male GIS moderates the effect of effort on perceived self-congruence. The interaction effect of effort x male GIS is significant (.271, $p = .007$). The conditional effects

of effort at different values of male GIS demonstrate that when male GIS is high, the effect of effort on perceived self-congruence is positive. The results support hypothesis 2.

Test of hypothesis 3. The conditional indirect effect of effort on product attractiveness at values of male GIS is positive when male GIS is high (effect: .523, interval [.043; 1.056]). The index of moderated mediation is .225 and significant because the confidence interval excludes zero (interval [.034; .429]). The findings support hy-

pothesis 3. Among male consumers with high GIS, the green product requiring effort is more attractive than the green product that does not require effort. Perceived self-congruence mediates this effect. Table 1 also reports the mean values of product attractiveness dependent on male GIS and effort. For this illustration, we split male GIS into three groups (percentiles: 3; 5). Again, the mean values demonstrate that product attractiveness was lower when the choice contained effort – only when male GIS is high effort increased attractiveness.

DISCUSSION

We argue that effort that a behavior requires can make the behavior manlier. Because the feminine perceptions of green behaviors may deter males from performing them (Brough et al. 2016), we examined whether an effort that a green product requires may increase the attractiveness of that green product. As expected, we find that, on average, effort reduces a green product's attractiveness. However, male consumers with high male gender identification strength (GIS) find a green product that requires effort compared to one that does not to be more congruent with their self-concept and more attractive.

We make the following contributions. Only few studies have examined the positive effects of effort and previous research has not studied the moderating effect of male GIS in this context. Our findings suggest that when targeting male consumers to whom being manly is of high importance, emphasizing the effort that is required by a green choice may increase the attractiveness of that choice. Based on our theory, we suggest that the presentation of an effort needs to be masculine in order to make the behavior more attractive to males with high GIS. Furthermore, our findings suggest that linking an effort to masculine perceptions (e.g., being active or being capable) should make the choice more attractive to male consumers. The latter may be possible by emphasizing the physical component of an effort. As an example, the request "sweating for the environment" may be more attractive to males than "spending time for the environment" as part of a cleanup campaign. Thus, well-considered presentations of a required effort can help to make green behaviors more attractive to male consumers.

Our theory does not only apply to green behavior. Effort may make any behavior manlier. However, since green behaviors suffer from their feminine perceptions the findings seem most relevant in this context.

Limitations

This study tested two types of effort in a specific context, and the specific effort types are likely to be perceived as masculine. Therefore, we cannot distinguish the effect of the effort involved from the effect of its masculine nature. Future studies should test the effects of other types of effort.

The required time investment in this study was 15 minutes per week, which is relatively low. Future studies should investigate the effects of increasing amounts of effort that may result in different effects. This study measured the perceived attractiveness of a green heating system but did not observe behavior. Future studies may observe real behavior.

To Give or Not to Give: The Roles of Narcissistic Grandiosity and Vulnerability in Gift-Giving

Jen-Hsien Hsu, De Montfort University, UK
Suha Omar, De Montfort University, UK

INTRODUCTION

What drives narcissistic consumer in gift-giving—an opportunity to showcase a grandiose self-image, or a battle to maintain current self-image or a matter of both? In this research, we investigate how narcissistic grandiosity, vulnerability, and their interplay, collectively impact gift-giving orientations—to what extent consumers find pleasure from gift-giving and from buying gifts as well as a tendency to offer a generous gift that exceed recipient's expectations.

The research contribution is twofold. Firstly, we provide further insights regarding the role of narcissistic vulnerability in gift-giving which is underrepresented in the extant literature. More importantly, we further investigate how the interaction between narcissistic grandiosity and vulnerability impacts gift-giving, which is largely neglected in existing studies.

NARCISSISM AND GIFT-GIVING

The evidence for the relationship between narcissistic grandiosity, narcissistic vulnerability, and their interplay is sparse and tentative. As to the relationship between gift-giving and narcissistic grandiosity, extant literature suggests grandiose narcissists regard gift-giving as an opportunity to achieve their interpersonal goals. For instance, Hyun, Park, and Park (2016) found that in a romantic relationship, grandiose narcissists gift-giving behaviors are driven by the motivations to secure their current relationship and to show off in front of others. This inclination reflects the mentalities that grandiose narcissists hold—linking gift-giving with interpersonal goal pursuits (Emmons 1987; Raskin and Terry 1988; Wink 1991). As such, we hypothesize that grandiose side in narcissism positively influences gift-giving orientations.

Hypothesis 1: Narcissistic grandiosity positively predicts gift-giving orientations.

The relationship between narcissistic vulnerability and gift-giving is underrepresented in the extant literature. A plausible reason lies in a fact that this covet side of narcissism, having a fragile self-esteem, is not strongly related to general goal pursuits (Boldero, Higgins, and Hulbert 2015; Miller et al. 2011; Wink 1991). However, when it comes to self-image threats, such facet could come into play. For instance, Casale et al. (2016) found that narcissistic vulnerability is positively correlated with the motivation of hiding imperfection in the self-presentations. Therefore, we conjecture that narcissistic vulnerability, though triggered by self-protections, still positively impacts gift-giving orientations.

Hypothesis 2: Narcissistic vulnerability positively influences gift-giving orientations.

Lastly, we hypothesize that interplay between narcissistic grandiosity and vulnerability, though largely neglected in the extant literature, also positively impacts gift-giving orientations as we argue pure high levels of narcissistic grandiosity or vulnerability are insufficient to promote gift-giving. More precisely, high levels of narcissistic grandiosity would also lead to high levels of self-inflation and arrogance which would demotivate consumers to engage gift-giving (Emmons 1987; Raskin and Terry 1988). Similarly, high levels of narcissistic vulnerability can result in high levels of introversion (Miller et al. 2011; Wink 1991); the need of maintaining self-image through gift-giving becomes less pressing. Therefore, we conjecture gift-giving are boosted under high levels of both narcissistic grandiosity and vulnerability. Our view regarding such interplay is supported by the recent work from Manley et al. (2018) in which they found the conditional effect of narcissistic vulnerability between narcissistic grandiosity and goal persistence.

Hypothesis 3: The interplay between narcissistic grandiosity and vulnerability positively influences gift-giving orientations

PRESENT STUDY

We conducted two studies to examine the roles of narcissistic grandiosity, narcissistic vulnerability and their interplay in gift-giving orientation. In our first study, we investigate how narcissistic traits are associated with the two sources of pleasure in gifting—buying gifts and giving gifts (Macklin and Walker, 2015; Mortelmans and Damen, 2001). In our second study, we examine how these factors impact gift choices—choosing a standard gift that meets the recipient's expectations or a generous one that exceeds the expectations.

STUDY 1

Research Design and Measurements

We recruited 103 US participants from Amazon Mturk (M_{age} = 31.3; Male = 66) to investigate the influences of narcissistic grandiosity, narcissistic vulnerability and their interplay on two types of pleasure in gifting— pleasure from gift-giving (PGG) and pleasure from buying gifts (PBG). With respect to measurements, we used the narcissism single item scale (Konrath, Meier, and Bushman 2014), the narcissism grandiosity scale (Rosenthal et al. 2019) and the narcissism vulnerability scale (Crowe et al. 2018) to measure the narcissistic trait as a whole (M = 4.41), narcissistic grandiosity (α = .911, M = 4.21), and narcissistic vulnerability (α = .950, M = 4.62). The self-esteem scale (Rosenberg 1965) was included to contrast differences between non-narcissistic and narcissistic gift-giving tendencies and to treated as a covariate in the model (α = .727, M = 4.52). As to the two dependent measures, we used Mortelmans and Damen (2001) gift-giving satisfaction scale to measure pleasures from gift giving (α = .773, M = 6.07) and Macklin and Walker (2015)'s gift-giving joy scale to measure pleasures from buying gifts (α = .791, M = 5.71). All the research instruments were assessed on a 7-point Likert-type scale (1 = strongly disagree and 7 = strongly agree) apart from the narcissism single item scale in which we asked participants to indicate to what extent they feel they are a narcissist from 0 (totally disagree) to 10 (totally agree). Lastly, participants also reported their gifting budgets by stating the number of gifts they generally buy a year and the average price of each gift.

RESULTS

We first assessed common method bias (CMB) by performing Harman's single factor test in SPSS. Having constrained the number of factors to one, an un-rotated exploratory factory analysis revealed that the total variance explained by a single factor is 36.566 which is below the threshold of 50% (Podsakoff et al. 2003). This suggests that the dataset does not exhibit CMB issues.

We then conducted the Pearson's correlation test to contrast differences between non-narcissistic and narcissistic gift-giving tendencies (PGG and PBG). The results suggest that narcissistic traits, compared to self-esteem, yield to different gift-giving tendencies. Firstly, all the narcissistic traits are found positively correlated to PBG ($r_{narcissism}$ = .337, p = .000; $r_{grandiosity}$ = .405, p = .000; $r_{vulnerability}$ = .238, p = .016); the correlation between self-esteem and PBG is found insignificant. Contrastingly, none of the narcissistic traits is significantly correlated with PGG whereas self-esteem is ($r_{self-esteem}$ = .309, p = .001).

The follow-up moderation tests were conducted to further examine how narcissistic grandiosity, vulnerability, and their interplay collectively influence PGG and PBG with the use of PROCESS (Model 1) for SPSS (Hayes 2013). Self-esteem, gender, and budget were treated as covariates in these models. We then observed two positively significant interaction effects in both models. As to the pleasure from gift-giving, the results showed that both grandiosity and vulnerability negatively predicts PGG ($\beta_{Grandiosity}$ = -.44, p = .013; $\beta_{Vulnerability}$ = -.98, p = .000) whereas the interplay positively predicts PGG ($\beta_{Grandiosity * Vulnerability}$ = .169, p = .000, 95% CI [.10, .26]). The follow-up floodlight analysis (Johnson and Neyman 1936) revealed that grandiosity positively predicts PGG under the condition when the levels of vulnerability are at 3.5 and above. Similarly, the negative correlations between vulnerability and PGG turns insignificant when the levels of grandiosity are at 4.09 and above.

As to pleasure from buying gifts, we observed a negatively significant effect from vulnerability ($\beta_{Vulnerability}$ = -.63, p = .013) and a positively significant interaction effect from the interplay ($\beta_{Grandiosity * Vulnerability}$ = .121, p = .005, 95% CI [.04, .21]). In the follow-up floodlight analysis, the results showed that grandiosity positively predicts gift-buying pleasure when the levels of vulnerability are at 2.45 and above; the negative influence of vulnerability on PBG turns insignificant when the levels of grandiosity levels are at 2.58 and above. To sum up, we observed narcissistic grandiosity, vulnerability and their interplay yield to different impacts on gift-giving tendencies when they are collectively analyzed in the model. More importantly, the results imply that gift-giving is likely to be driven under high levels of both narcissistic grandiosity and vulnerability. In our next study, we examine whether such pattern is observed in a choice scenario: giving a standard (or a generous) gift that meets (or exceeds) the recipient's expectations?

STUDY 2

Research Design and Measurements

We recruited 100 US participants from Amazon Mturk with research incentives (M_{age} = 36.7; Male = 53); one participant was excluded from the analysis owing to incomplete responses. In this study, participants were asked to indicate to what extent they are inclined to offer a standard gift (a $50 reading lamp that meets the recipient's expectations) or a generous gift (a $90 backpack that exceeds the recipient's expectations) on an 11-point scale (0 = definitely the lamp; 10= definitely the backpack). The authors used the same instruments to measure narcissism (M = 2.31), narcissistic grandiosity (α = .91, M = 2.65), narcissistic vulnerability (α = .93, M = 2.57), self-esteem (α = .92, M = 4.74), and budget. Using the same procedure as in Study 1, CMB analysis showed that the total variance explained by a single factor is 26.493 indicating that CMB is not an inherent feature of our dataset.

RESULTS

The results suggest that narcissistic traits, contrasting to self-esteem, yield to a different gift-giving preference in this scenario. In the Pearson's correlation test, we observed narcissistic traits are positively correlated to the preference for the generous gift ($r_{narcissism}$ = .265, p = .008; $r_{grandiosity}$ = .282, p = .005; $r_{vulnerability}$ = .323, p = .001); the correlation between self-esteem and this preference was found insignificant. We then conducted a moderation test to examine how narcissistic grandiosity, vulnerability, and their interplay collectively influence gift preference with the use of PROCESS (Model 1) for SPSS (Hayes 2013). Self-esteem, gender, and budget were treated as covariates. The results revealed that the simple main effects of narcissistic grandiosity and vulnerability are insignificant, but the interplay is ($\beta_{Grandiosity * Vulnerability}$ = .31, p = .019, 95% CI [.05, .57]). The follow-up floodlight analysis revealed that narcissistic grandiosity positively predicts preference for the generous gift under the condition that the levels of vulnerability are 4.33 and above; narcissistic vulnerability also positively predicts PGG when the levels of grandiosity are 3.01 above.

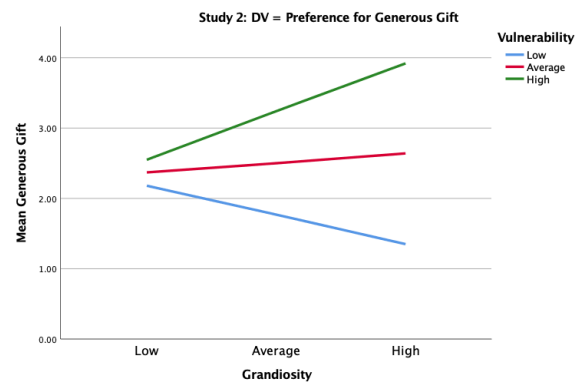
In summary, we found the same pattern in this gift preference scenario. Whilst self-esteem is not associated with a preference for a generous gift, both narcissistic grandiosity and vulnerability are. More importantly, this inclination is driven under high levels of narcissistic grandiosity and vulnerability.


Figure 1: The interaction plot

GENERAL DISCUSSION

Across the two studies, we examined the interactive relationship between the narcissistic traits upon gift-giving. Both studies showed that these traits yield to different gift-giving orientations, compared to self-esteem, in zero-order correlations. We found that both narcissistic grandiosity and vulnerability are positively correlated to pleasure from buying gifts (study 1) and to an inclination to offer generous gifts that exceeds the recipient's expectations (study 2), which validate our hypothesis that instrumental values play a central role in narcissistic gift-giving—be it to showcase or maintain their self-image (Campbell, Foster, and Finkel 2002; Hyun et al. 2016; Sherry 1983).

More importantly, we found narcissistic grandiosity, vulnerability and their interactions yield to different impacts on gift-giving orientations. Regarding the single main effect of narcissistic grandiosity, we found that it is only negatively associated with pleasure from giving gifts, compared to that of narcissistic vulnerability which is negatively associated with both pleasure from giving and buying gifts (study 1). We suggest this is owing to the reason that gift-giving is more associated with interpersonal gains (Emmons 1987; Raskin and Terry 1988; Wink 1991). As such, the grandiose side in narcissism makes gift-giving more enjoyable, compared to the vulnerable

counterpart. However, in terms of behavioral tendencies, these two facets in narcissism lead to a similar outcome (study 2).

What actually drives gift-giving? We found that all the gift-giving indices in our studies, the pleasure from gift-buying and gift-giving along with the generous gift-giving tendencies, were consistently positively predicted by the interplay. These results support our third hypothesis that only under adequate levels of both narcissistic grandiosity and vulnerability would consumers strongly associate the interpersonal gains/ maintenance in the gift-giving which then promotes gift-giving. To the best of our knowledge, we are the earliest who capture such detailed insights regarding how the two sides in narcissism collectively impact gift-giving behaviors.

Table 1: Summary of the findings:

H1	Narcissistic grandiosity positively predicts gift-giving orientations	Supported at zero-order correlations (to PBG and generous gift-choice). However, the single main effect of narcissistic grandiosity negatively predicts PGG.
H2	Narcissistic vulnerability predicts gift-giving orientations	Supported at zero-order correlations (to PBG and generous gift-choice). However, the single main effect of narcissistic grandiosity negatively predicts both PGG and PBG.
H3	The interaction between narcissistic grandiosity and vulnerability positively predicts gift-giving orientations	Supported. The interaction effect consistently and positively predicts all three gift-giving measures.

LIMITATION AND FUTURE RESEARCH

This research presents compelling evidence regarding how narcissistic grandiosity and vulnerability operate as a complex dyad in explaining gift-giving. However, as the present research was taken under a one-shot hypothetical gift choice, it is inevitably exposed to the issue of hypothetical bias which limits the external validity of the research (Hensher 2010). We recommend future researchers to study consumer's actual gift purchases to overcome this limitation. In addition, as this research only captures the correlation relationship among gift-giving intentions and two forms of narcissism, we also recommend future researchers to adopt the priming technique to further validate the research hypotheses and provide further managerial implications.

As to future research caveat, we recommend researchers to investigate different types of narcissistic gift-giving tendencies such as their preferences to offer experiential (vs. material) gifts as well as how would narcissistic consumers prioritize the potential interpersonal gains (e.g., demonstrating economic vs. social vs. cultural capital) in their gift-giving practices (Chan and Mogilner 2016). Secondly, we recommend future researchers to consider the role of publicity (Griskevicius, Tybur, and van den bergh 2010) in gift-giving and investigate the potential interplay in the decision-making process.

The Role of Consumption Activities Within Symbolic Spaces in Shaping the Identities of People Living in Poverty

Anis Jounaid, Institut de Recherche en Gestion-UPEC, France
Abdelmajid Amine, Institut de Recherche en Gestion-UPEC, France

INTRODUCTION

Market-driven consumption has become one of the main factors of status access and identity projects' definition, both individually and collectively (Arnould and Thompson 2005). However, many individuals and groups are found to have a merely partial participation in the marketplace, marginal, even. This may be due to (non-)consumption choices following ideological (Kozinets and Handelman 2004), cultural (Hebdige 2002) or status (Arsel and Thompson 2011) considerations. Moreover, some vulnerability factors such as a physical disability (Baker, 2006), old age (Barnhart and Peñaloza 2013), illiteracy (Adkins and Ozanne 2005) or a precarious financial situation (Williams and Windebank 2002) may also exclude individuals from taking part in consumption activities.

These vulnerable populations suffer a power imbalance in the market consumption sphere (Baker et al. 2005). In that sense, their vulnerable condition (*ibid.*) is not a status, but rather the result of the interaction between individual characteristics and external elements (commercial strategies, social context) in a given situation. It is a constraining, permanent or temporary condition where consumers deal with institutional structures (market, public actors...) that are not tailored to their distinctive characteristics.

The present study tackles the condition of poverty from an identity viewpoint as we adhere to the idea that (non-)consumption choices and activities are socioculturally and spatially embedded (Saatcioglu and Ozanne 2013), and can influence consumers' identity projects (Arnould and Thompson, 2005). Limited economic, social and cultural resources put people living in poverty (referred to as "PLP" throughout the paper) in a weak position in the market (Alwitt 1995), which leads to a discrepancy between what consumption society enables to do and what material constraint prevents from doing. PLP may then resort to non-governmental organizations to tend to some of their daily needs, such as food. This dual access of vulnerable consumers, either to conventional marketplaces (market-sphere-related) that express valued (or at least normal) identities or to charity-related spaces (assistance-related) associated with stigmatized ones, results in activating identity negotiation strategies that unfold through (non) consumption activities. Being that consumption is spatially anchored (Saatcioglu and Ozanne 2013), the latter consumption spaces are assumed to shape people's identities, in the sense that these places of consumption impose behavioral codes and standards that forge individual identities, either by adopting or endorsing them (conforming to the norm), or by circumventing or resisting them (deviance from the norm) (Amine and Gicquel 2011). In accordance with the consumption spaces (unconstrained vs constrained) backed by different offer schemes (wide and free choice vs limited and imposed choice), identities are expressed through the adoption of singular behaviors (overt and claimed vs inconspicuous and unacknowledged) and the expression of differentiated feelings (pleasure and accomplishment vs shame and losing face) (Chase and Walker 2013).

Our goal is to delve into identity strategies used by PLP to (de) subscribe (from)to (rejected)valued social identities and navigate between them, framing our research question as follows: How does PLP's affiliation to charity-related consumption spaces shape their social identity? And how do they negotiate these identities?

Following a quasi-ethnographic research design, we have conducted observations and interviews with affiliates of a situated space of non-market-driven consumption, "Les Restos du Cœur", one of the most prominent charities in France. The thematic-content analysis of our respondents' discourses highlighted different space-bound consumption activities adopted by PLP. Three symbolic consumption spaces have been identified: constrained (stigmatized), non-constrained (normal) and hinge, among which PLP navigate, using cultural and social resources.

LITERATURE REVIEW

PLP In A Consumption Society

We envision poverty as a social dynamic (Simmel 1907/1998) that transcends material constraints to encompass important status, identity and social dimensions (Hamilton and Catterall 2006; Paugam 1998). People Living in Poverty (PLP) are individuals lacking economic, social and cultural resources (Bourdieu 1984; Holt 1998) and/or the ability to activate them, and are therefore restricted in their evolution potential in a consumption society, partly made of "exclusionary" spaces (i.e. marketplaces) (Castilhos and Dolbec 2018,5). Marketplaces are consumption spaces produced as a result of negotiation between social actors (Castilhos 2019), including businesses which, among other things, promote a cleaving social organization (Saatcioglu and Ozanne 2013) resulting in the "segregation of less resourceful people from specific places" (Castilhos 2019, 582).

Furthermore, the marketing paradigm underlying access to products and services, which enable individuals' material aspirations and full inclusion into the consumption society, is middle-class-biased (Hill 2002), and based on the idea that consumption choices derive mainly from preference (Bone, Christensen, and Williams 2014), irrespective of economic and cultural considerations. Consumers outside of this marketing-defined field (Hill 2002) are partially or totally excluded from the market-driven consumption sphere, which can translate into higher access-to-consumption costs compared to privileged classes (Caplovitz 1967). Thus, the lack of financial resources can exclude PLP from the marketplace and bring about a set of vulnerabilities, such as severed social connections (Paugam 1998), and an exit from the conventional economic sphere, leading to a break with society (Castel 1991), all of which have a substantial impact in shaping PLP's identities (Cohen 1997; Reutter et al. 2009).

PLP: An Identity Perspective

In line with both our conceptions of poverty and consumption (i.e. a socio-culturally and spatially situated activity) we mobilize the work of Goffman (1963) who studied identity dynamics through the lens of social interactions and noted a tension between virtual (attributed) and actual components of an individual's identity. This is linked to a discrediting attribute, a stigma (e.g. physical, mental or character disabilities), which "constitutes a special discrepancy between virtual and actual social identity" (*ibid*, 3). The said discrepancy is all the more present in the case of social interactions between normal individuals (people who conform to social norms) and stigma bearers. The latter can potentially be stigmatized due to their non-conforming situation (Goffman 1963), so they resort to identity negotiation strategies to cope with the tension between their actual and virtual social identities. Hence, analyzing people's identity configuration seems quite relevant when studying individuals whose consumption needs are not always met.

In the French context, PLP can benefit from welfare programs under certain conditions. Still, the welfare state cannot bridge the gap created by an unequal wealth distribution system, so non-governmental charity organizations take on the mission of preventing a total disconnect from society (and from consumption access) (Hamilton and Catterall 2006; Oosterlynck et al. 2013). These social innovations, such as charities, that develop on the fringes of institutional structures, are contextually localized responses to the inability of both the market and the public sphere to tend to PLP's full needs and mitigate the risks of social exclusion. The spatial separation between charities and mainstream marketplaces can materialize a distinction between market-related and charity-related identities, leading to downgrading feelings and stigmatization (Nau, Derbaix, and Thevenot 2016). This matter of fact legitimates the use of a Goffmanian framework to explore the tensions between PLP's experiences with non-governmental organizations and "the idealized consumption-oriented lifestyles that global consumer culture promotes" (Yurdakul, Atik, and Dholakia 2017, 299) and the ways they cope with. The charity-related space affiliation can be seen as stigma symbols referring to poverty and assistance (Chase and Walker 2013), whereas the conventional consumption area (i.e. supermarkets) can be seen as a prestige symbol (Goffman 1963) related to market-driven experiences in a consumption society where self-perception is closely linked to the capacity to consume (Holt 2002).Studies linking identity and consumption have mainly focused on affluent consumers (Belk 1988; Kozinets and Handelman 2004; Sandikci and Ger 2010) rather than vulnerable ones like PLP in a context of subsistence and market exclusion. We propose to cover this ground by analyzing how PLP consumption activities, embedded in consumption spaces, can shape their identities. More precisely, we study the consumption activities that PLP adopt inside the charity space and outside this area (i.e. marketplace), and the ways they combine the two to negotiate their identities.

METHODOLOGY

Fieldwork is conducted in the French charity, "Les Restos du Cœur," operating nationwide to provide, mainly, food assistance to eligible PLP[1]. The heterogeneity of profiles benefitting from this charity presents a broad scope of social, cultural and identity elements, allowing for a more thorough account of identity negotiation strategies through consumption activities. A qualitative method based on a quasi-ethnographic research design was selected to shed light on the meanings of consumption activities for PLP and to analyze the identity implications thereof.

Firstly, we made several visits to the Restos Du Cœur distribution center in Créteil in the suburbs of Paris, where we informally spoke with managers, volunteers and beneficiaries, to grasp the functioning of this non-market-driven space of consumption. Frequent observations were then made twice a week for 12 months along with semi-structured interviews with fifteen beneficiaries (nine women and six men), aged 32 to 63. Given the sensitive nature of the poverty topic (Hill 1995), we started by building a trusty relationship with the respondents to make them feel comfortable with the interviewing process, and also to establish the necessary empathy to be the closest possible to the meanings of their statements.

We asked open-ended questions about respondents' backgrounds and trajectories, both charity and market-related consumption activities and experiences as well as their perceptions, attitudes and judgments of their living situation with respect to themselves and others both inside and outside charities. Interviews lasted one hour on average and took place either in the distribution center, cafés or respondents' homes, at their convenience.

The interviews were transcribed and analyzed via thematic-based coding following an iterative process between literature and gathered data. The authors double-coded a portion of the collected data both to validate and stabilize the coding scheme (Miles and Huberman 1994). Interviews were first coded with the purpose of remaining as close to the respondents' intended meanings as possible at a category level, and then emerging themes were built while moving up in terms of theorization (Spiggle 1994).

FINDINGS

The analysis of the collected data shows that (non-)consumption activities hold ambivalent meanings in regard to identity implications. These activities are analyzed in light of their potential ability to position PLP in of the following three symbolic consumption spaces:

Consumption Activities that Place Individuals to the Constrained (Stigmatized) Space

In addition to their non-market-driven consumption activities inside charities, other ones like compromise between basic expenses such as housing (Amine and Toumi 2018) and food consumption through storing and consuming goods after the expiration date as Jean (56 years, lost his job due to health problems) states: "they gave me a veggie pizza in June, it's still in the freezer even though it shouldn't have exceeded September", anchor consumers in poverty, as identification between beneficiaries is facilitated by their sharing said consumption activities. Consumers who partake in these activities reify the constrained dimension of this consumption space (i.e. charities), as an '*entre-soi*' that either consecrates participants' internalization of the beneficiary, stigmatized (Chase and Walker 2013) social identity, or allows others to use this space as a place to socialize even with people experiencing the same constrained situation, which is illustrated by the following excerpt from Jean: "Coming here is to have, to be able to communicate (…) there are [people] who understand or happen to be in the same situation".

Consumption Activities that (Re-)Place Individuals in the Non-Constrained (Normal) Space

The Identification/disidentification among PLP is based on the similarity/divergence of adopted consumption practices compared to other individuals living in poverty. PLP can reject the beneficiary social identity by, temporarily, adopting affluent consumers' practices such as consuming paid cultural or hedonic services (Holt 1998), as Jean asserts:" Oh, leisure, well, when I have some savings every now and then (…) it's Louvre Museum, it's Musée de l'Homme, I am still a scientist". By doing so, impoverished consumers momentarily escape their constraining materiality and the related beneficiary identity, by (re)placing themselves in a non- constrained (normal) symbolic consumption space. They do not give up their charity-related consumption activities, though, as long as they resort to information control strategies, like concealment and/or selective disclosure (Goffman 1963) regarding their beneficiary status to avoid stigmatization and to be able to navigate securely between the two spaces, such as Alain (45 years, unemployed, temporarily homeless): "No, few people know (that I am a charity beneficiary), only my friend and my mom".

---

1   Respondents earning less than 667 euros a month which is beneath the 50 % economic poverty threshold established by INSEE in France (867 euros) in 2019.

Consumption Activities Between Normalcy and Poverty: A Hinge Space

The hinge space is composed of consumption places where people consume either for economic or status (symbolic) reasons, installing a blurred distinction or a confusion between constrained (i.e. non-market-driven) and alternative (i.e. market-driven) identities expressed in these interstice places. Activities pertaining to this consumption space refer to both financially constrained and affluent consumers. This ambivalence can be understood by comparing the meanings associated with human-scale market buying of both consumers' profiles. While there is a statutory dimension (Thompson and Coskuner-Balli 2007) related to said activity for the former (i.e. alternative ideology), the economical dimension is what drives the latter to adopt it as Gabriel (38 years old, unemployed) states: "You fall back on local growers (…) there is a farm near Chennevières, as we are directly dealing with growers, it's way cheaper". Collecting discarded goods (or Gleaning) presents itself as an analogous case as it holds practical meaning for Amélie (48 years, retired) who resorts to it rather out of necessity, "when I need a piece of furniture (…) something expensive, if I find it [even] broken [in the street], I'll repair it", than as a form of alternative provisioning (Guillard and Roux 2014).

DISCUSSION AND CONCLUDING REMARKS

Our first theoretical contribution is a conceptualization of consumption spaces as a framework for understanding PLP's identity configuration, which we illustrate in table 1 below. We focus on identity strategies PLP resort to in order to (de)subscribe (from)to (non) constrained spaces.

Consumption spaces have been conceptualized as spatial types marked by dynamics of participation/subjugation and negotiation/ consensus (Castilhos and Dolbec 2018). We find charities to share specificities with segregating (entre-soi) and emancipating (rehabilitating vulnerable consumers) spaces.

In our analysis, the frontier between constrained and non-constrained spaces is not clearly defined, it's more of a junction (inclusive) space between the exclusive spaces than a limit separating the two. Rather than a classification of disjointed elements, the constrained and non-constrained consumption spaces are linked by the hinge space, forming a continuum through which PLP can navigate, switching from one space to another, depending on their social contexts and the social identity they want to (dis)identify (from)with, using information control strategies for instance (Goffman 1963).

The second contribution of this exploratory research is highlighting the potential of the symbolic dimension to transcend, even temporarily, the material one (Hogg, Banister, and Stephenson 2009). As consumption practices hold social meaning, they enable PLP to navigate from constrained to non-constrained consumption spaces and briefly dissociate from material difficulties by adopting consumption choices, hedonic ones for instance, that (re-)place them in a valued social identity set (Hamilton 2012). This contrasts with the opposite movement, from non-constrained to constrained space, motivated by status and ideological dimension as it is the case with collecting discarded goods (Guillard and Roux 2014). This highlights the ambivalent nature of consumption activities' meanings, which can be used as an identity strategy based on the blurred distinction between the constrained and the chosen nature of consumption activities such as the collection of discarded objects (or gleaning) or human-scale market buying to distance themselves from the rejected impoverished identity.

Finally, the pendulum swings depend on the availability of social and cultural resources (Bourdieu 1986; Holt 1998) along with the capacity of the PLP to activate them. This relates to the temporality (transitory or enduring) of the poverty situation, a structural element in the experiences of our respondents (Amine and Toumi 2018).

As our research focuses only on one charity, we are currently working on gaining access to another non-governmental organization to broaden the scope of our study and circumvent the possibility

Table 1: Consumption spaces and identity negotiation

Consumption activities	Identity strategies	Consumption space
• Fare evasion • Food consumption after expiration date • Charitable consumption	• Identification to other beneficiaries to avoid isolation	*Constrained space:* Non market-driven consumption (Charities)
• Human scale markets (farms) • Buying second-hand goods • Collecting discarded goods (Gleaning)	• Prevalence of economic reasons over identity and status' motives to attend these places • Blurred distinction between constrained and alternative identities	*Hinge space:* Market and non-market-driven consumption (interstice places)

• Hedonic consumption
• Cultural consumption
	• Information control:
	  o Concealment
	  o Selective disclosure
		Non-constrained space:
		Market-driven consumption (Traditional markets)

of a structuring effect of the organization on the beneficiaries 'consumption activities, and, therefore, identity negotiation. In addition, we are negotiating with our interviewees to allow us to follow and observe them as they make forays into an unconstrained space (supermarkets, paid leisure spaces, etc.), in order to understand the way they behave, consume and use material signs (such as clothing) to express their identity, and put these elements into perspective with what we have observed in the charity constrained space.

When Saying Less Tells More:
The Impact of Socio-Economic Status on Justifying Luxury Consumption

Goedele Krekels, IÉSEG School of Management, France

INTRODUCTION

When a person sends a signal by using a luxury brand, another person may acknowledge receiving the signal. Will the signaler then offer a justification? And how will this justification (or lack of) be perceived? The answers depend on the socio-economic status of both the signaler and the receiver.

SOCIO-ECONOMIC STATUS (SES) AND LUXURY JUSTIFICATIONS

Most of the literature on luxury consumption has focused on the signaling function of brands in a typical one-directional format: either from the signaler's perspective, or from the perspective of the target who receives the signal (Connelly et al. 2011). This research has shown that signalers expect receivers to make certain inferences about their identities based on which possessions and brands they choose to display and how they display them (e.g. Belk, Bahn, and Mayer 1982; Berger and Heath 2007; Dubois, Rucker, and Galinsky 2012; Wang and Griskevicius 2014). Furthermore, how receivers interpret such signals is based on a combination of the signal itself and of the signaler's characteristics (e.g. Bellezza, Gino, and Keinan 2014; Shalev and Morwitz 2012; Sirgy 1982).

However, the literature has neglected possible bi-directional effects. If the receiver indicates he or she has received the luxury signal, how does the original signaler respond? Through five studies we examine whether the original signaler offers a justification for the origin of the luxury product, and how this justification (or lack thereof) is received by the recipient. Most research on luxury justification has focused on self-justification. This includes consumers' tendency to construct a pre-purchase internal justification to allow for indulgent spending or consumption (Cheema and Soman 2006, Dubois, Laurent, and Czellar 2001, Kunda 1990, Okada 2005) or consumers' internal post-purchase reasoning aimed at justifying past indulgent expenses to reduce cognitive dissonance (Oxoby 2004, Mitchell and Boustani 1994).

In this research, however, we examine whether the original luxury signaler provides a justification to the person who has acknowledged receiving the signal, and the content of this justification. Given the lack of research on the topic, the five studies presented here offer a first investigation of how the original receiver of the luxury signal reacts to the presence or absence of a justification, and of the form it takes. More specifically, we examine the impact of socio-economic status (SES) on justifications and on the interpretation of justifications.

Research has shown that consumers with high socio-economic status (SES) are less likely to engage during social interactions (Kraus and Keltner 2009) and see less motivational relevance in other people (Dietze and Knowles 2016). Furthermore, high SES people should also be more familiar and experienced with luxury consumption, making a current luxury consumption less exceptional and therefore less noteworthy to them (Adler, Epel, Castellazzo, and Ickovics 2000). Thus, we predict that people with high SES would not justify their luxury consumption to a conversation partner.

There is only limited research on luxury conversations by consumers with lower SES. We do know that people are embarrassed when their identity signal (here, their public consumption of a luxury product) and their beliefs about themselves (here, their low SES) are incongruent (Cavanaugh, Nunes, and Han 2016). To solve this incongruence, people with a lower SES may offer some justification for the ownership of the luxury product. This could be seen as a type of impression management for low SES consumers (Schlenker 1980). Thus, we predict a general main effect of consumer SES, where a lower SES would lead to an increased likelihood of justification. Second, if justifying luxury could indeed be seen as a type of impression management, one could also predict that the social status of the receiver might influence the luxury consumer's justification. In fact, we predict that low SES consumers might feel more incongruence between their own status and their signal with a high-status conversation partner, and this might make them more likely to justify their luxury consumption. We predict the opposite effect with a low-status conversation partner, where the luxury signaler might be less likely to justify to distinguish themselves (Stephens, Markus and Townsend, 2007).

Five studies test the general prediction that a decrease in SES leads to an increase in justification of luxury consumption, due to impression management. In the fifth study we also examine if this main effect indeed depends on the SES of the conversation partner.

STUDY 1 – WHO JUSTIFIES?

A first study examined whether people do in fact justify luxury consumption and what types of justification they use. A sample of 379 Mturkers (132 Men, M_{age} = 36.7) participated in a scenario study. They read a scenario in which they attended a social gathering during which an unfamiliar person recognizes their luxury wristwatch and enquires whether it is a specific brand and model. Respondents then saw an open-ended question in which they were prompted to reply to the other person. Afterwards they completed measures on how they thought the other person would perceive them, and answered questions related to materialism (Richins and Dawson 1992), status consumption (Eastman et al. 2015), and social comparison (Gibbons and Buunk 1999). Respondents also indicated their SES both subjectively, with the MacArthur ladder question (Adler et al. 2000), a direct social class question (Jackman 1979), perceived financial security (Mittal and Griskevicius 2016) and perceived status (four items, e.g. "I have high social status") and objectively (measured as annual household income and education level).

Answers to the open-ended scenario question indicated that most respondents merely acknowledged the watch model (60%). Some respondents did justify their ownership of the watch as a gift or bonus (17%), inheritance (2%) or by indicating they borrowed it for the evening (1%). Other responses included claims of big discounts (3%) or counterfeit watches (5%). Logistic regression on these responses indicated that people high in subjective but not objective SES were more likely to purely acknowledge the watch without giving any justification (e.g. effect of perceived status B = -.260, SE = .082, Wald χ^2 (1) = 10.192, p = .001). Furthermore, those who gave

no justification for owning the watch believed this to indicate marginally less embarrassment ($M = 2.72$, $SD = 1.40$ versus $M = 3.00$, $SD = 1.26$, $t(337) = -1.735$, $p = .084$). This effect was reinforced by interactions with individual difference variables: the higher the respondent's materialism ($p = .011$), status consumption ($p = .026$) or social comparison propensity ($p = .057$), the stronger the effect of subjective SES on lack of justification. This is a first indication that impression management might be at play.

STUDY 2 – WHO JUSTIFIES WHEN?

In a second study, we wanted to confirm this lack of justification by high SES people. One reason for the high amount of mere acknowledgements in the first study could have been the lack of knowledge about the origin of the watch. Therefore, this time re-

FIGURE 1: Effect of Materialism and SES on the Likelihood to Justify

spondents were given an explicit origin for the luxury watch. A sample of 320 Mturkers (125 Men, $M_{age} = 37.7$) saw the same scenario as in the previous study, but were either told that they received the watch as an inheritance from family (ascribed condition) or as a professional performance bonus at work (acquired condition). After the scenario and purchase manipulation, respondents were asked whether they would justify their ownership of the watch ("Yes, it is indeed this brand. I received a family inheritance/professional performance bonus from my company") or not justify it but merely acknowledge it ("Yes, it is indeed this brand"). Respondents answered the same personality questions, individual difference measures and SES items as in study 1.

Results indicate that people were more likely to justify their ownership of the luxury watch in the acquired condition than in the ascribed condition (B = .572, SE = .233, Wald χ^2 (1) = 6.036, $p = .014$), in line with impression management. Furthermore, supporting the results from the first study, people scoring high on subjective SES were again less likely to offer a justification, regardless of the condition (e.g. effect of perceived status B = -.215, SE = .103, Wald χ^2 (1) = 4.312, $p = .038$). In both conditions we found that not giving a justification was thought to indicate less embarrassment ($M = 2.70$, $SD = 1.36$ versus $M = 3.10$, $SD = 1.34$, $t(312) = 2.54$, $p = .012$). Furthermore, the justification (or lack of it) mediated the effect of the subjective SES on embarrassment (b = .04, 95% CI .09 – .005, $t= 2.21$, $p < .05$). Thus, in both studies are people with low SES more likely to justify the consumption of a luxury watch in public, and a lack of justification is thought to indicate less embarrassment.

STUDY 3 – CAN PEOPLE PREDICT THE CONSEQUENCES OF JUSTIFICATION?

In a third study, we examined how luxury consumers predict that their justification (or lack of) will be interpreted. If impression management drives the justification of luxury, consumers should have specific predictions that could lead to a positive impression for a lack of justification. A sample of 184 Mturkers (64 Men, $M_{age} = 39.1$) read a similar scenario as in the previous studies. They were assigned to one of three conditions where they either did not justify wearing the watch (lack of justification condition) or justified it through an inheritance (ascribed condition) or work performance bonus (acquired condition). Afterwards, participants were asked to predict how their conversation partner would perceive their personality and subjective SES as well as their perceptions of the luxury watch. We also measured their self-image through self-esteem (Rosenberg 1965) and need for power (Anderson, John, and Ketlner 2012).

Respondents who gave a justification for wearing a luxury watch inferred that they would be perceived as having a lower SES (e.g. ladder score $M = 7.06$, $SD = 1.87$ vs. $M = 5.55$, $SD = 1.66$, $t(180) = 3.54$, $p = .003$) and being more embarrassed ($M = 1.53$, $SD = .89$ versus $M = 2.30$, $SD = 1.57$, $t(183) = 2.71$, $p < .001$) than those who did not justify. However, interaction effects with individual difference variables showed that justifying the luxury product might also have positive effects. In both justification conditions, a more positive self-image increased predicted status perception (e.g. effect of justification by self-esteem $F(1, 180) = 6.97$, $p < .05$) and decreased predicted perception of embarrassment (e.g. effect of justification by self-esteem $F(1, 176) = 3.95$, $p < .05$) to the same level as those in the justification condition. Furthermore, a positive self-image also led to predictions of being perceived as a more agreeable person (e.g., effect of justification by self-esteem on liking $F(3, 178) = 1.499$, $p < .05$) in the case of a justification.

STUDY 4 – WHAT ARE THE CONSEQUENCES OF A JUSTIFICATION?

A fourth study focused on the other side of the communication dyad: the target who receives first the signal then the justification. In this study we wanted to examine how luxury signalers are judged depending on the justification (or lack of) they offer. If the decision whether to offer a justification is a form of impression management, it is essential that the impression one wants to give is correctly iden-

TABLE 1 Effect of Signal Receiver's Self-esteem and Justification on Product Attitudes

	Beta	SE	*T*	*p*
Constant	4.947	1.031	4.800	.000
Justfication	1.180	.659	1.789	.797

tified. Thus, instead of signalers predicting how their justification (or lack of) could be perceived, we actually measure how the receiver perceives it. A sample of 187 Mturkers (87 Men, M_{age} = 37.3) read a scenario similar to those in the previous studies, but from the perspective of the person who recognizes the brand and type of the luxury watch of their conversation partner. They saw one of three conditions from the previous study: lack of justification, ascribed condition, and achieved condition. Afterwards, respondents indicated their perception of the signaler's personality and subjective SES as in previous studies as well as their perceptions of the luxury watch and the self-image measures.

Signalers who gave no justification for wearing a luxury watch were perceived as having a higher SES than those who did justify (e.g., status ladder score *M* = 8.33, *SD* = 1.00, vs. *M* = 8.05, *SD* = .73, *t*(97.389) = 2.545, *p* = .013). In line with signalers' expected positive perceptions in the previous study, interaction effects with the individual difference variables showed that justifying the luxury product might have positive effects. Receivers with a more positive self-image (measured through self-esteem and sense of power) indicated more positive product attitudes and better personality impressions in both justification conditions compared to the lack of justification condition (e.g. effect of justification by sense of power *F*(3, 178) = 11.818, *p* = .037).

STUDY 5 – WHO JUSTIFIES TO WHOM?

In the fifth and final study, we examined the impact of the receiver SES on the likelihood of offering a justification. If luxury justification could be a type of impression management, the social status of the receiver should influence signaler's justification. We predict that a lower SES individual might be more likely to offer a justification to reduce their incongruence in the eyes of a high-status receiver, but less likely to offer a justification to a similarly low-ranked individual, to distinguish themselves. A sample of 185 business school students (75 Men, M_{age} = 21.4) read a scenario similar to those in the previous studies, from the perspective of the person wearing the watch. They saw one of two conditions: either their conversation partner was a medical doctor earning a high income, or a sales worker owning a low income. Afterwards, they indicated how likely they were to justify wearing the watch, and indicated their own subjective SES as in previous studies, as well as that of the other person as a successful manipulation check. Finally, they responded to an "impostor syndrome from luxury consumption" scale (Goor et al. 2019) as a measure of incongruence between their luxury signal and their SES.

Results indicated a marginally significant interaction effect between signalers' and receivers' SES on the likelihood of offering a justification (B = -.242; SE = .135, *t*(181) = -1.797, *p* = .074). Respondents with a low SES were more likely to justify their luxury consumption to a high SES receiver than to a low SES receiver, in line with our predictions. The likelihood of a high SES respondent offering a justification, however, was independent of the receiver's SES. This interaction was mediated by impostor feelings for low but not high SES consumers (-1SD: B = .162, CI = .016 to .187; +1SD: B = -.097, CI = -.327 to .086; Index = -.113, CI = -.292 to -.001). Thus, it seems that impression management is indeed especially important among low SES luxury consumers.

CONCLUSION

These five studies are the first to examine how a signaler reacts to a receiver's inquiry about a luxury signal, and how this reaction in turn may influence the receiver's perception of the signaler. We show that people low in SES are more likely to justify their consumption of a luxury product in public when asked about it, though they are aware that they might give away their lower social status that way. However, interactions with the signaler's and receiver's personality might lead to positive effects of justifications, resulting in more positive perceptions of product and personality. Furthermore, in line with impression management theories, this justification effect only exists for high SES receivers but disappears for low SES receivers.

I Don't Own It But It's Mine
The Impact of Materialism on Perceived Ownership of Rented Luxury

Goedele Krekels, IÉSEG School of Management, France
Bruno Kocher, University of Neuchâtel, Switzerland
Sandor Czellar, HEC Lausanne, Switzerland
Brigitte Müller, IAE De Toulon, France

INTRODUCTION

Renting luxury products has become a new trend. Due to their high need for ownership, literature theorizes that materialists should react negatively to renting. We demonstrate that high (low) materialists in fact feel an identical (higher) perceived ownership of and attitude towards bought versus rented luxury, because of brand attachment.

RENTING LUXURY AND MATERIALISM

Recently, new forms of acquisition such as renting luxury products gained traction in the sector, rendering luxury consumption no longer limited to the highest social classes. In general, renting produces positive effects on cognitive dissonance, self-exploration, budgeting and convenience (e.g. Yeoman, 2011). However, since renting means using the object for a limited time, it might not become part of the extended self (Belk, 1988), decreasing a sense of ownership and hence having a less positive effect on perceptions (Perkins and Forehand, 2012). Furthermore, renting *luxury* may blur the signaling power of luxuries (Wilcox, Kim, and Sen, 2009), making them less exclusive (Yeoman, 2011).

We argue that materialism, which denotes a set of centrally held beliefs about the importance and pursuit of possessions and wealth in one's life (Ger and Belk, 1996; Kasser, 2002), will play a key role in consumer response to how luxury product are acquired. According to literature, since possessiveness and control of ownership are important to materialists, materialists might react negatively to rented luxury (Belk, 1985). We predict however that materialists might actually become attached to the rented luxury objects and in turn construct a sense of perceived ownership leading to an equally positive reaction to rented and bought luxury.

There is strong evidence in the literature that materialistic consumers suffer from a lower self-esteem (e.g. Chaplin and John 2007; Kasser 2002), which they try to compensate through the consumption of luxury goods that can signal status and prestige (Dittmar, 1992, Kasser & Ryan, 1993), forming strong attachment to these luxury objects (Escalas and Bettman 2003; Richins and Dawson 1992). However, for these luxury product associations to bolster materialists' self-esteem and become part of their self-identity, they need to be perceived as 'mine' (Park and John 2010; Pierce, Kostova, and Dirks 2003; Weiss and Johar 2016). There are two routes to ownership: actual legal ownership, which is impossible in the case of renting, but also non-legal psychological ownership (Peck and Shu 2009; Pierce, Kostova, and Dirks, 2003). As psychological ownership is based on the strong connection and incorporation into the self of the object and its associations (Belk, 1988; Dittmar, 1992; Pierce, Kostova, and Dirks 2003), we believe that materialistic people's strong attachment to luxury might result in a sense of psychological ownership despite a lack of legal ownership in the case of renting. Thus, through a mechanism of brand attachment and perceived ownership, materialists might not experience many consumption differences between rented and bought luxury. However, as non-materialists' self-identity is less likely to encompass luxury, they will react more objectively to rented luxury, do not create attachment to or a sense of ownership over the product, and in turn have less positive reactions to rented than bought luxury.

We examine the positive impact of renting luxury on ownership for materialistic consumers (study 1) due to brand attachment (study 2). We test 2 boundary conditions of brand attachment (studies 3 and 4), showing that it is indeed attachment to the rented luxury that drives the effect. Finally, we investigate the impact of acquisition mode and materialism on managerially relevant outcomes (study 5).

STUDY 1 – IMPACT OF MATERIALISM ON RENTAL OWNERSHIP

In a first study, we examined the general impact that materialism has on the perceived ownership of rented and bought luxury goods. To test whether our predicted effects would hold for the target consumers of these luxury rental companies, in collaboration with a high-end watch and jewelry brand that was interested in new types of retailing strategies we employed 435 members of a national service organization (392 men, M_{age} = 57, SD = 11, M_{yearly_income} = [150,000 - 200,000 USD]). Respondents read a watch-shopping scenario in which they either bought or rented a luxury watch. To ensure respondents thoroughly read and visualized themselves in this scenario, participants spent several minutes answering an open–ended question in which they were asked to describe their feelings, emotions or thoughts that came to mind when they thought about wearing the watch. Afterwards, they indicated their sense of ownership over the watch (Peck and Shu, 2009) and answered the Material Values Scale (Richins and Dawson, 1992). We found the predicted interaction effect between materialism and acquisition mode on sense of ownership (β = -.265, t(430) = -2.045, p = .042): the more materialistic a participant, the less differences in perceived ownership were observed for a rented vs. bought watch (JN-value = 6.51). This study demonstrate that an increase in consumer materialism level increases the likelihood of viewing a rented (vs. bought) luxury product equally in terms of ownership.

STUDY 2 – THE IMPACT OF BRAND ATTACHMENT

In study 2 we directly examine why materialistic consumers process rented objects as owned objects by testing the underlying driver of brand attachment, and enhance the external validity of our effect by examining real behavior rather than using a scenario. 201 Students from a large university (94 men, M_{age} = 21.3, SD = 2.9) participated in a 3-day incentive compatible lab study. On the first day, participants were given an existing luxury pencil from a well-known luxury stationery brand, priming the luxury status of the brand and product. They were instructed that as part of the study, they would have to pay to rent or buy this luxury pencil. Respondents in the renting condition were emphasized that their rental period would be the two days in between stage 1 and stage 2 of the lab sessions, and that they would have to give the pencil back at the end of phase 2. Respondents in the buying condition were clearly instructed that the pen was theirs and they got to keep it, but that they had to bring it with them for phase 2. This was done to keep the physical proximity of the luxury pencil constant across conditions in the second stage.
Figure 1 - Effect of Acquisition Mode and Materialism on Ownership

When respondents returned 2 days later, they indicated their brand attachment to the luxury pencil (Escalas and Bettman 2003), sense of ownership over the pencil (Paundra et al. 2017), and answered the Material Values Scale (Richins and Dawson, 1992) amongst other measures. Those who rented the pencil also had to return it at the end of phased 2.

A regression showed that materialism again moderated the effect of acquisition mode on perceived ownership (β = .61, t(198) = 2.58, p = .011, JN = 4.89) (figure 1). The more materialistic the participant, the less difference perceived by that individual with regards to the ownership of a rented (vs. bought) pencil. Furthermore, brand attachment mediated this moderation effect (Index = -.150, CI = -.331 to -.028), in line with our predictions.

STUDY 3 – DECREASING ATTACHMENT TO PRODUCT TYPE (LUXURY VS. NON-LUXURY)

In study 3, we further examined brand attachment as the underlying explanation of this positive effect of renting for higher (vs lower) materialistic consumers by testing a theoretical boundary condition. To do so, we investigated both luxury and non-luxury products. As non-luxury products do not help materialistic people enhance their self-identity and self-esteem through consumption, there is no reason for them to become attached to these products, and construe the rental of non-luxury products in line with owned products. We followed the same scenario design as in study 1 and added a non-luxury condition. The results from 742 online participants (308 Men, Mage = 39.7, SD = 11.0) showed a marginally significant three-way interaction, indicating that in the non-luxury condition all respondents felt more ownership of bought than rented products, indicating only a main effect of ownership and no interaction with materialism (β = .08, t(346) = .40, p = .688). In the luxury condition, we replicated the results from study 1 and 2, showing that materialism moderated the effect of acquisition on the sense of ownership, such that high (low) materialists felt similar (lower) sense of ownership

in the renting condition as in the buying condition (β = .50, t(394) = 3.04, p = .002).

The analyses confirm that the more materialistic consumers are, the less they perceive a difference in ownership between rented and bought luxury products. The results also indicate that decreasing the product associations needed for materialists' self-identity boost, hence the attachment to a certain product, indeed diminishes the inclination to view renting as a form of ownership for highly materialistic consumers. Taken together, the results of this study provide support for brand attachment as an underlying process behind the interaction effect between materialism and the acquisition mode on perceived ownership for luxury products.

STUDY 4 – DECREASING ATTACHMENT THROUGH INCREASING SELF-ESTEEM

In study 4, we expand the support for brand attachment by examining a second theoretically-relevant boundary condition: self-esteem. As stated, previous literature has shown that materialistic people use conspicuous consumption to cope with low self-esteem (Kasser 2002; Richins and Dawson 1992). Therefore, increasing consumer self-esteem may decrease the attachment to luxury products for higher (vs. lower) materialist consumers, and should decrease their psychological ownership. A sample of 884 online participants (342 men, Mage = 37.1, SD = 11.8) listed either four (easy, self-affirming) or twelve (hard, not self-affirming) positive characteristics of themselves (pretested to manipulate self-esteem), followed by the design of study 1b. The results showed a marginally significant three-way interaction (β = .370, t(882) = 1.750, p = .081). In the weak self-affirmation condition, we again replicated the effects from study 1, 2 and 3 (β = .545, t(394) = 3.589, p = .004): materialism significantly influenced sense of ownership for those who rented the product, and for highly materialistic consumers there was no difference between renting and buying. In the strong self-affirmation condition however, where materialistic respondents no longer suffered from a low self-esteem,cthere was only the main effect of acquisition mode but no

moderating influence of materialism on the effect of renting versus buying on ownership ($\beta = .175$, $t(464) = 1.187$, $p = .236$).

This study again supports the moderating effect of materialism on the relationship between the acquisition mode and perceived ownership of luxury products. Given the fact that highly materialistic consumers tend to suffer from chronically low self–esteem (Chaplin and John 2007; Sivanathan and Pettit 2010), the weak self–affirmation condition was similar to their standard level of well–being, leading to in increased sense of ownership of rented objects through brand attachment. In the strong self–affirmation condition however, consumers' self–esteem was boosted, in turn reducing their attachment to luxury rentals and in turn their sense of ownership. Overall, this study further supports our argument that brand attachment may drive the interaction between materialism and the effect of the acquisition mode on perceived ownership.

STUDY 5 – MANAGERIAL CONSEQUENCES

In Study 5, we explore the downstream consequence of our theorizing. Research on the endowment effect has shown that the sense of owning an object, even without real ownership, produces a strong positive effect on product attitudes (Beggan 1992, Perkins and Forehand 2012). Therefore, we investigated product attitude as the

CONCLUSION

Globally, our findings indicate luxury rentals as a viable new alternative mode of access to luxuries, besides currently used strategies such as masstige products. The finding that renting and buying luxury produces similar positive effects for more materialistic consumers, coupled with the fact that our current societies are becoming increasingly materialistic (Burroughs et al. 2013), leads us to believe that luxury rentals represent an important potential consumer market. Furthermore, considering the impact of materialism on renting luxury not only has practical implications, but also advances theoretical insights. We add to the materialism literature, corroborating previous theorizing on materialism as a motivated goal pursuit and indicating that renting luxury is a goal-oriented behavior for materialistic consumers, showing that usage rather than ownership of luxury items may be key for materialists' self-identity. Further, we extend the literature on solid versus liquid consumption, indicating that the difference between the two might not just be a theoretical construct, but that one might on fact be mentally construed as the other and vice versa based on consumers' needs. Finally, we add to the literature on ownership, indicating renting as a possible source of psychological ownership identical to buying, but also showing that

psychological ownership may be a discriminating process based on motivation besides only context clues.

key downstream construct. 204 students (113 men, Mage = 21.15, SD = 2.11) saw the same design as in Study 1b. They also indicated their attitude towards the product. A moderated mediation analysis showed that buying luxury led to higher product attitudes than renting moderated by respondents' materialism as in previous studies, and fully mediated by sense of ownership (Index = -.11, CI = -.02 to -.24).

The results of this study again confirm our main hypothesis: more materialistic people perceive less of a difference in ownership between rented and bought luxury products. Furthermore, we show that this effect is not only limited to the psychological concept of perceived ownership, but that it also influences consumption-relevant outcomes such as product attitudes. As product attitudes have been shown to influence consumer behaviors such as product valuation, purchase intention, willingness to pay and brand loyalty (e.g., Perkins and Forehand 2011), this study broadens the scope of our findings.

Motives For Anonymous Gift-giving and Its Beneficiaries

INTRODUCTION

The literature on gift-giving in recent years answered many questions. For instance: who are the *givers* and what are the motives behind gift-giving and re-gifting (Ballantine & Parsons, 2011; Segev, Shoham, & Ruvio, 2013) and how gifting can act as symbolic communication between *giver* and *recipient* (Sherry, 1983) and therefore indicate goodwill in a relationship (Caplow, 1982). Thereby, this research primarily focused on the giving aspect and hence, the *giver* of gifts. Gift-giving takes many different forms, starting with gifts that are given privately and directly, such as gifts for Christmas or birthdays, up to and including gift-giving in the form of charitable donations (Sherry, 1983). In all these acts of giving that research has focused on thus far, it is clear that the recipient is chosen deliberately. Either the giver shares a personal relationship with the recipient, or is giving to a particular group of people (e.g. victims of a natural disaster) for whom someone (e.g., organizations) is requesting donations. However, there are also forms of gift-giving which build upon the idea of giving to an unknown recipient without the need to ask for it. One example gaining increasing attention in the last couple of years are so-called public bookcases. These are used to give away unneeded books (gift-giver) but of which may be of some interest to others (recipients). Another novel example are food-sharing initiatives where people provide food in public areas for others to take (LittleFreePantry, n.d.). The aim of this current paper is to focus on emerging ways of gifting unknowns, using the example of public bookcases, to discover the motives behind utilizing this practice of giving and also to take a deeper look at the beneficiaries (recipients) of this new form of consumption.

THEORETICAL BACKGROUND

Public bookcases are boxes or some similar sort of bookcase that is publicly accessible allowing the placement and exchange of books, and providing a free, anonymous manner to give away, share and obtain access to books. In recent years, public bookcases have been widely implemented throughout Europe and especially in German speaking countries. For example, according to the website open-bookcase.org a total number of 4,228 public bookcases worldwide have been reported (OpenBookCase.org, n.d.). In Vienna, Austria, approximately 60 public bookcases and other public book sharing possibilities can be found. While the bookcases are mostly provided by associations, private initiatives or the city administration, it is upon private citizens to place, exchange and take books from the bookcase.

Regarding the process of using a public bookcase the well-researched motivations for gift-giving fall short here. The process of gift-giving requires a giver and a recipient (Mick & DeMoss, 1990). However, in the case of public bookcases the recipient is anonymous. Therefore, in this instance, gift-giving does not fulfill the function of establishing and maintaining a relationship as proposed by Belk (1976). Also, the motivation behind giving cannot include neither the sending of signals about future investments in a relationship (Camerer, 1988), nor a symbolic act of communication (Sherry, 1983). Furthermore, the usage of offers like public bookcases does not fit the definition of charitable donations. A charitable act is undertaken to help people, who are in need of special resources or assistance (Ranganathan & Henley, 2008; VandenBos, 2017). The usage of a public bookcase, from the perspective of giving, is not a purposive act benefitting socio-economic disadvantages, but rather an act with an unknown outcome for others (gift-givers). Important to note here is that public bookcases, as well as other examples in this segment such as food-sharing initiatives, offer both the possibility to give and receive simultaneously, which is unlike charitable donations, where the role of giver and recipient are distinct at the moment of donating. Furthermore, Sargeant & Woodliffe (2007) point out the necessity of asking for a charitable donation as a defining element, which cannot be applied to public bookcases. The research question emerging regarding this circumstance is:

RQ 1: What are the motives that lead people to give gifts to anonymous recipients?

The possibilities of anonymous gift-giving raise the question of who the recipients are. For example, public bookcases can either be utilized for the mere act of sharing, or as a way of giving to people of a lower socio-economic status who lack access or the resources to obtain books. Public bookcases can be discussed as part of the sharing economy (Belk, 2014; Botsman & Rogers, 2010) with the principal idea of less possession and finding alternative manners of consumerism. In addition to other characteristics, Bikos and Papadimitriou (2017) identify public book exchanges as "an act of social policy undertaken by the civil society itself" (Bikos & Papadimitriou, 2017, p. 32). They argue that public bookcases contribute to society providing access to educational material for those unable to afford it. Therefore, public bookcases may not only serve as a way to distribute good readings for booklovers, but also foster education, self-education, lifelong learning and intellectual learning to people who lack these benefits. It is against this background, that our second research question focuses on the recipients of books placed in public bookcases shedding light on if such initiatives of anonymous giving can reach the socio-economic poor and thus bear a charitable notion of gift-giving as described above.

RQ 2: Who are the recipients of anonymous gift-giving and does their socio-economic status differ from the givers?

METHODS

Sample

This current research builds on intensive field work on public book cases in Vienna, Austria. The research project used a mixture of methods, including *observations* and *photographical documentation* of three public book cases (for a period of two weeks with seven observations per bookcase per day, resulting in a total of 294 observations), as well as a *representative questionnaire*. For the latter, a representative sample from Vienna, Austria was drawn for an online survey. The survey link was opened by 1,206 visitors, out of which 105 participants aborted the survey. Overall, 1,101 participants completed the survey; out of all the participants, 179 reported to have neither having heard of nor seen a public bookcase and therefore excluded from the final analysis. Of the remaining sample, 421 participants reported never having used a public bookcase and thus also excluded. One participant did not provide demographic data and was therefore also excluded. Thus, the final sample consisted of 500 par-

Table 1: Descriptive and statistical values regarding the ANOVAs testing of differences in the three groups.

ticipants (48.4% men, M_{age} = 43.13 years, SD_{age} = 14.15, $Range_{age}$ = 18-69) for further analyses.

Procedure

First, we asked participants how many books they placed in or took from the bookcase in the last year and how many they place or take on average per visit. Participants then indicated how often they visit a public bookcase and why they use (place and take books) it. Next, participants answered the social value scale (56 items; adapted from Schwartz, 1992) in which we asked them to rate the importance of each item (e.g. "equality – equal opportunity for all"; "social recognition – respect, approval of others") as a principle in their life on an 8-point Likert scale, ranging from 1 ("completely unimportant") to 8 ("totally important"). The 56 items represent ten different values (achievement, benevolence, conformity, hedonism, power, self-direction, security, stimulation, tradition, universalism). The internal consistency was satisfying for all value scales (Cronbach's α > .69). Furthermore, participants estimated the number of books they possess and how many books they read per year on average. Using an open question, we asked them for their motives behind giving and/or receiving books and if they use other methods to give away or receive books and if so, which distribution channels they use besides public bookcases (e.g. "Why do you put books in a public bookcase?"). For these final questions we used an open-ended question format to ensure the answers were unrestricted and handled the participants' answers as qualitative data. Finally, socio-demographic data was assessed.

RESULTS

Concerning the observation and photographical documentation of the three public bookcases, we registered a total of 4,547 books in the bookcases during the two weeks of observation. On average 84 books were located in a bookcase per observation and an individual book remains there for 20 hours until removed.

For the representative questionnaire, as a first step to uncover the motives behind giving gifts to anonymous recipients, we focused on participants who indicated to having placed books in a public bookcase at least once, independent of their removal behaviors, (N = 416, 47.6% men, M_{age} = 44.00 years, SD_{age} = 14.02, $Range_{age}$ = 18-69) and the reasons they gave for placing books in a public case. Accordingly, we did a qualitative content analysis to categorize their answers (Mayring, 2010) and found seven different motive catego-

ries in a total of 611 given reasons. The most common reason was the benefit for others (25.53%, e.g. "So that others can also read a good book for free"), followed by the motive of merely discarding books (21.93%, e.g. "because I already read a book and don't need it anymore"). The third most often stated reason was to use a public bookcase as an alternative to throwing books away (20.62 %, e.g. "I don't want to throw away books I don't need anymore. Books are too valuable to throw away.")[1]. After this analysis we further examined the most mentioned motive behind benefitting others. The answers in this category were again divided into two groups. The first one and most mentioned was benefitting an undefined other person (80.13%, e.g. "to give others pleasure"). The other group of motives was benefitting people with a lower socio-economic status and supporting a societal social balance (19.87%, e.g. "so that people who cannot afford to buy books can read the newest bestsellers", "it is knowledge for free, a contribution to nature and society").

When looking at motives users of public bookcases state for taking books, again independent of their giving behaviors (N = 380, 50.8% men, M_{age} = 43.14 years, SD_{age} = 14.52, $Range_{age}$ = 18-69) we found eight different motive categories in a total of 388 given motives. The most common motive was the interest and curiosity in one or more of the books in the bookcase (40.98%, e.g. "because I often find interesting books"), followed by financial motives (17.27%, e.g. "in order to have a book at hand for free which I couldn't afford otherwise") and the motive of wishing for a constant supply of books to fulfil ones' reading habits (14.95%, e.g. "because I need new reading material"). Eighty-four people of this sample reported to have taken books without replacing any in public bookcases (52.4% men, M_{age} = 39.00 years, SD_{age} = 14.16, $Range_{age}$ = 18-69). When we look at their book taking motives, the results show the same most important reason, that of interest and curiosity (39.29%), followed by financial motives (17.86%) and other unclassified reasons (17.86%, e.g. "to gather knowledge").

In order to answer the question of who the beneficiaries of anonymous gift-giving are and if their socio-economic status differs from the givers (RQ2), we ran an ANOVA to compare the mere recipients of books (R) with the mere givers (G) and people who engage in both, giving and taking books (sharer; S). The results show that recipients are significantly younger and own significantly less books than the other groups. Concerning values, recipients showed significantly lower scores in universalism. Furthermore, the groups

---

1   Detailed data available upon request.

differ significantly in self-direction and in the number of books they indicated to have read in the last year (see table 1 for detailed results). However, we did not find any significant differences of the three groups concerning socio-economic variables (e.g. educational status and income).

GENERAL DISCUSSION AND CONCLUSION

Our observation of three public bookcases in Vienna, Austria clearly demonstrates a high usage rate and acceptance of this manner to give and receive books anonymously and for free in the population and stresses the relevance to scientifically study similar initiatives of anonymous gift-giving. The results of the representative study show that the most common motive behind giving to anonymous recipients is a benevolent one, in which the focus is on the joy and pleasure of others. However, this motive is closely followed by other motives that are rather self-interested, i.e., the motives of discarding books and the aversion of disposing unneeded books. However, one fifth of people who want to benefit others explicitly want to assist those of a lower socio-economic status. This result supports the importance to find out who the recipients of anonymous gift giving are in comparison to the givers. Our results show that currently the recipients of anonymous gift-giving are significantly younger, own less books and have a lower score of the universalism value than givers of books, as well as people who report to give and take books. However, we did not find that recipients necessarily had a lower socio-economic status than the givers, even if the second most common motive to take books are financial reasons. Furthermore, we found that sharers show significantly higher scores in self-direction. Based on Schwartz (1992) the value of self-direction is connected to creativity, independence, curiosity, self-respect and a high appreciation of freedom of action and thought. Due to the aspect of curiosity and a kind of open-mindedness that comes with this value, sharers might also be users who are seeking ̄new experiences, like public bookcases in general and are interested in both the experience of giving as well as the experience of taking books. However, in order to sufficiently explain this aspect, future research should further examine the characteristics of givers, recipients and sharers.

Alongside its merits, the current study also has some limitations. First, when asking people about their motives behind giving gifts, social desirability might lead people to overstate their own benevolent motives. However, the collected data clearly shows that the participants do not hesitate to also report self-interested motives (e.g. not enough space to keep books). We therefore assume a negligible effect of social desirability. Second, in order to provide people of lower income and/or educational level with free educational material, public libraries are a valuable source, that was not included in our study. However, public bookcases and libraries differ in some aspects. For example, with public bookcases the focus lies on the exchange of books between consumers, unlike in libraries. Furthermore, unlimited loan-periods apply to public bookcases as the books are not traced and there are no means of recording the placing and taking of them. Also, owing to the issuance of a library card and opening hours, we expect the hurdles in borrowing books from a library to be greater than that of those taking a book of a public bookcase, which can be utilized by anyone at any time as they are publicly accessible. We suggest to include the role of libraries in comparison to public bookcases in future studies.

Public bookcases and other initiatives enabling people to gift anonymous recipients have the potential to reach the ones in need. By providing books publicly, those with lower income and educational levels can be encouraged to read and therefore strengthen their involvement in cultural and societal activities (Otnes & Ilhan, 2009),

and foster lifelong learning and self-education (Bikos & Papadimitriou, 2017). However up to this point, the books placed in public bookcases are not reaching the socio-economic disadvantaged. We advise providers of public bookcases to encourage people with a low socio-economic status to make use of the bookcases. Also, we want to draw the city administrations and other initiators of public anonymous gift-giving projects' attention to the possibility of promoting these activities as a way to help others and thereby integrating them in the discourse and practice of creating a socially sustainable and educating society.

Co-consuming a Pet Home: Balancing Functionality and Aesthetics of a Taste Regime

Anu Norrgrann, Hanken School of Economics, Finland
Henna Syrjälä, University of Vaasa, Finland

INTRODUCTION

In this paper, we aim at exploring how the aesthetics and functionality of pet homes are balanced in the socio-material practices produced in the interaction within digital platforms. The home as a place for consumption is previously addressed in culturally oriented consumer studies discussing practices, and agentic and expressive capacities of objects in home (e.g., Arsel & Bean, 2013; Csikszentmihalyi & Rochberg-Halton, 1981; Figueiredo, 2016; Epp & Price, 2010; Valtonen & Närvänen, 2015). Recent work has addressed the notion of taste (Arsel & Bean, 2013, 2018), conceptualized as an accretion of material goods through processes of socialization, sensemaking and preference shaping. Taste as a reflexive, systematic practice that creates social hierarchies is thus regarded to emerge and become negotiated in interactions between consumers. Our study joins the discussion in which online platforms are considered as the mediators, re-creators and modifiers of taste (Arsel & Bean, 2013; Phillips, Miller & McQuarrie, 2014).

We build particularly on Arsel and Bean's (2013) concept of problematization, which shows how deviations from normative and cultural standards of taste question the alignment of everyday objects, doings and meanings. This conception appears particularly omnipresent in pet homes. Literature on consumer-animal relations describe a balancing between aspired aesthetics of a certain taste regime and the multiple functionalities living with pets requires. To illustrate, Jyrinki (2012) discusses how pets act as their owners' "character developers", and Belk (1996, 127) describes pets as "problems", in which roles they may, "be messy, do damage, and disrupt normal routines" in homes.

The focus of this paper is in the intersection between two areas of consumption; pet ownership and interior decoration, the Scandi-modern taste regime, in particular. We investigate how the socio-material consumption practice of problematization appears as a constant balancing between aesthetics and functionality, and how solutions for these mundane negotiations are produced in the interaction emerging in digital platforms. In doing so, we adopt a distributed agency perspective (Bajde, 2013), rooted in assemblage theory (Canniford & Bajde, 2016). We expand the notion of co-consumption (Kylkilahti et al., 2016) to describe shared agency between fellow consumers, and between human consumers and non-human, technological and material entities. To this end, the study draws on two sets of qualitative, netnographically generated data from two extensive Facebook-groups related to pets and to interior decoration. We contribute to the extant research by interlinking the prior examinations on co-consumption and non-human animal agency (e.g., Bettany & Daly, 2008; Bettany & Kerrane, 2011; Smith, 2016; Syrjälä et al., 2016; Syrjälä & Norrgrann, 2018, 2019) with literature on socio-material practices illuminating taste regime at home (e.g., Arsel & Bean, 2013, 2018; Phillips, Miller & McQuarrie, 2014; Epp & Price, 2010; Valtonen & Närvänen, 2015).

THEORETICAL FOUNDATIONS

Agentic Animals as Co-consumers in Home Assemblage

Although pet animals cohabit with their owners, most of the extant research on consumers and their animals lacks focus on home as a shared consumption space, home emerging only as a by-product of living together with non-humans. To illustrate, one of the earliest consumer studies on pets by Hirschman (1994) illuminates the various roles pets may possess, and the boundaries assigned to pets at home (e.g., if they are allowed on the sofa, or in the bedroom) demonstrate the meanings given to the animals. Similarly, most prior studies on companion animals rely on a human-centered view as, for instance the roles of animals are elaborated from the human's perspective, that is, how consumers experience what their pets mean to them (e.g., Belk, 1996; Brockman, Taylor, & Brockman, 2008; Hirschman, 1994; Holbrook et al., 2001; Jyrinki, 2012).

To address these gaps, the current study joins the post-humanist stream of consumer studies on animal companions (e.g., Bettany & Daly, 2008; Bettany & Kerrane, 2011; Smith, 2016; Syrjälä et al., 2016) and focuses on non-human agencies in home assemblage (Syrjälä & Norrgrann, 2018, 2019). In these accounts, the idea that agency is solely possessed by human consumers is left aside, and instead, the differences and interdependencies between human and non-human entities are illuminated to show how agency appears in varied and multiple qualities in assemblages (Canniford & Bajde, 2016), such as homes.

Furthermore, by directing attention to both human and animal agency, we regard humans and non-human animals co-consumers (Kylkilahti et al., 2016), whose agency may be captured as co-existing and mutable in relation to emerging situations and conditions that flicker in the networks that produce home. From this post-human perspective, human and animal constitute a co-consuming unit with distributed agency, where both are co-implicative and intertwined within the material-cultural environment of the home. This relates to Cheetham and McEachern (2013), whose notion of inter-subjectivity emphasises subjectivity of the animal entity and the reciprocity of this subject-subject relationship (also, Haraway, 2003). Borgerson (2013) has proposed a typology in which agency is analyzed in terms of effects and intentions, in a way that living entities (be they human or non-human) may hold intentional capacities of agency, whereas non-living things trigger only effects (see also, Syrjälä et al., 2016). For instance, Epp and Price (2010) and Figuereido (2016) understand that the agentic capabilities of material objects in the home are not as purposefully intentional, but they are capable of being agentic through their relations.

Taste regimes and agentic digital communities

A particular characteristic of the home as a place of consumption is that it often involves aesthetic pursuits. Consumers' ideas of a beautiful home can be understood through the notion of taste, which, in Bourdieu's (1984) definition, is a mechanism through which individuals judge, classify, and relate to objects and acts of consumption. In recent work by Arsel & Bean (2013; 2018) taste is conceptualized as reflexively performed everyday practice that reinforce symbolic boundaries, creating social distinction. They have introduced the notion of taste regime, which encapsulates the linkage between aesthetic and action - dimensions that particularly characterize consuming homes. The taste regime concept illustrates the orchestration of objects, doings and meanings in an aesthetic system, and enroll consumers in processes of problematizing (questioning material objects' relation to the taste regime's meanings), ritualizing (establishing behaviors that align objects with doings) and instrumentalizing (enrolling objects and doings to actualize meanings).

Table 1: Integration between pet-related practices and Scandi-modern taste regime in Facebook groups

	Problematization	Balancing	Interaction in the digital communities	Illustrations from diglital platforms (openings of discussion threads)	
Objects	toys, beds, bowls, food, leashes, sofas, rugs, floor materials, space	optimizing the astheic-functional ratio in objects, redefining "ownership" boundaries of objects, hiding/camouflageing, accessorizing	seeking and sharing product ideas, recommendations, inspiration; reinforcement of the taste regime through shared product understandings and preferences	"What kind of baskets for dog toys you have? Preferably, some that look stylish enough to be kept in the living room by force of circumstance 😄"	"We are expecting a puppy to our home. Could you post pictures of how your dog with his/her bed, bowls, and equipement is part of your home"
Doings	sleeping, eating, playing, destroying, messing up, storing, cleaning, moving between indoor/outdoor, taking into possession	finding material solutions that enable an integration pet-related doings and the taste regime; handling animal agency beyond human control □	seeking and sharing ideas for organizing and planning the home and its functionalities	"Do you have a restricted area in you homes in which your dogs are allowed to go or not? We are about to move to a new home, and I am "tempted" by the idea that our dogs (three big, long-haired 😊) would not be allowed into the bedroom or living room. The dogs would still have a plenty of space, the entire hall, kitchen and dining room. Wouldn't need to worry about them jumping onto the brand new leather couch, and it would be possible to keep at least a couple of rooms in a bit tidier condition 😄"	"I have a project of staircase painting ahead, which I have been avoiding already a year. And ever bigger pain comes from stair mats / anti-slip mats. Me, myself, I wouldn't ever want such a thing, but I need to think about our old dog, who still rushes wrecklessly in the stairs. So, please, post pictures of what kinds you have in use. 🐾 I can find web-pages myself, so what I need is just pictures to assure me that they are not all ugly 😄"
Meanings	challenged mininmalism, uncletteredness, tidyness, lightness, purity, threatened design orientation	integrating demands of easy maintenance (e.g. detachable and washable) into material objects; re-assessing the "sancity" of designer items	discursive portrayal of pets as obstacles in the taste regime; as unproblematic extensions of the taste regime; as a way to express individuality within the taste regime	"Honest opinions and viewpoints, please. Dare I really buy an off-white wool rug in a dog and cat family? Are they really so dirt-repelling that the occasional vomiting (which of course always ends up on the newest or most expensive rug) doesn't cause stains? Am I dreaming in vain of a white wool rug?"	"It would be nice to see photos of other Scandinavian and modern homes with pets 😊♀ This is ours (+ one dog not in the picture)"

In this research, we focus on pet homes as we elaborate particularly on Arsel & Bean's (2013; 2018) problematization practice, exploring how pet-related practices problematize, and become integrated into a specific interior decoration regime.

Culturally oriented consumer studies have emphasized the way in which discursive systems normatively shape and regulate consumption (Arnould and Thompson 2005; Arsel & Bean 2013), and the role of mediated culture, such as online communities and social media are acknowledged as central tastemakers, cultural intermediaries and triggers of desire today (Arsel & Bean 2018; Phillips et al 2014; Kozinets et al 2016). Participation in communities where a specific taste regime is cultivated offers a fruitful ground for exploring taste from a co-consumption and distributed agency perspective, revealing how the peer-to-peer interactions' show the "flickering" agency in the heterogeneous network of various human and non-human entities.

METHODOLOGY

Our research is grounded in a particular stream of practice theory, the socio-material practice approach, that acknowledges practices not only as social and cultural, but also as material (Fuentes, 2014). Most practice theoretical approaches place the *social* in practices, as activities of social life are carried out over and over again, and this mundane performativity is organized through a variety of collectively shared practices (Halkier and Jensen, 2011). However, as practices are manifested in individual performances and embedded in cultural structures (Halkier et al., 2011; Warde, 2005), the individual *human* consumer is seen as the carrier of practices. Although *material* artefacts are also situated in practices, in these views, they have no agency of their own (Fuentes, 2014) as, for instance, 'objects are handled' (Rexwitz, 2002) by a human activity.

In contrast, post-human practice approaches consider the agentic capacities of non-human entities as pivotal in the making of social practices (Schatzki, 2001). As Fuentes (2014) highlights, "to think in terms of socio-material practice is to treat materiality and its meanings, image and things, humans and non-humans simultaneously and as intrinsically interlinked." This resembles how assemblages are regarded as continuously shaped in the interactions between heterogeneous entities, both human and non-human, which "gain their qualities and capacities through more or less stable connections with fellow elements" (Canniford & Bajde, 2016, 2). In this way, prac-

tices and assemblages are mutually dependent as practices construct assemblages and assemblages in turn shape and have an impact on practices (Fuentes, 2014).

To generate an in-depth understanding on the prevailing socio-material practices and construction of taste in home assemblages as they appear in digital platforms, we employed netnography (Kozinets, 2015). Relying on the premises of (n)ethnographic research, in which the researcher ideally participates in the interaction within the community under study (Kozinets, 2015), we followed and participated in discussions in two Finnish Facebook groups, one focusing on dogs ("Dogs") and the other on interior decoration ("Modern and Scandinavian interior decoration"). In the dog-related Facebook group, we focused on the discussions on home-related matters, whereas in the interior decoration group we did the same in relation to pets in homes. As the idea of netnography is to study everyday life within virtual social interaction (Kozinets, 2015), it offers an unobtrusive way to generate data (Kozinets, 2006). Indeed, the topics appeared abundantly in both of the groups, which enabled us to observe the discussion without deliberately triggering any further discussions ourselves. Our material consists of both verbal discussion as well as pictures shared in the two communities.

FINDINGS

Our empirical examination addresses the questions of how pet-related practices intersect with and problematize adherence to a Scandi-modern taste regime, and how the digital Facebook communities as discursive systems play a role in this. Our findings and empirical illustrations, summarized in Table 1, are structured according to how objects, doings, and meanings are linked and orchestrated into patterns of consumption. The analysis focuses particularly on the problematization practice (Arsel & Bean 2013) when pet-related consumption considerations are assessed against the taste regime.

Even if pet-related *objects*, like their beds, toys or food containers can be perceived as challenging to align with the taste regime in a satisfactory way, the digital community contributes by offering a platform to share ideas, inspiration and concrete product tips on how to resolve these problems and balance functionality and aesthetics in the pet home.

Pet-related *doings*, from neutral activities such as eating or sleeping, to more strongly interfering like smirching or destroying, problematize the taste practice, particularly considering that the

agency of these doings is partly beyond of the human consumer's control and intention. In this respect, the digital community can provide peer resources for handling this integration by, for instance, providing ideas how, and with what kind of material resources to organize the pet-related activities in accordance with the taste regime (e.g. storing various pet items practically, but out of sight) or proactively plan interior solutions with a consideration of pet-related doings.

The *meanings* and material expressions related to Scandi-modernism are recurring topics of online discussion. Members of the Scandi-modern group characterize the style with terms such as clarity, minimalism, neutral colors, natural materials and designer items. When a pet is co-consuming the home, it may be perceived as a threat or limitation to these pursuits, expressed for instance as reluctance or hesitance to invest in delicate and/or expensive products, that one would choose were it not for the practical considerations. The collective online discourse reflects such trade-offs and problems, seeking peer reassurance, recommendations and warnings, as well as suggested solutions for integration. Nevertheless, pets and the Scandi-modern home are not always regarded as a problematic clash in the online discourse, but the groups also exhibit content of the two becoming integrated in unproblematic ways. From this viewpoint, the pet as a cultural symbol in fact rather enhances the specific taste regime and is used to match the décor (Syrjälä & Norrgrann 2019). While dogs carry a symbolic meaning related to homeliness in general ("a house without a dog is not a home"), the data provide examples that the role of dogs is also an aesthetic one. Picture material in the forums showcase dogs that are, for instance, color matched with their surroundings, or accessorizing the décor similarly as sheepskin rugs as typically used within the taste regime to indicate warmth and texture.

Overall, the social platforms where taste is negotiated, and practices discussed contribute to the integration of practices in several ways. In line with previous research (Phillips et al., 2014, Kozinets et al., 2016) these networks allow consumers to dream, plan, develop desires, and discover and refine their taste, be it by passively following the content, or more actively taking part in interaction and even through concrete peer-to-peer problem solving and practice integration.

CONCLUSIONS

In this study, we have delved into the socio-material practice of problematization (Arsel & Bean, 2013), and elaborated on how it appears and is balanced in the interaction emerging in digital platforms concerning pet homes. Furthermore, we provided illustrations on how agency appears distributed across various human and non-human entities when assembling home. The human consumer and non-human animal appear as a co-consuming unit, in which the non-human animal poses several functional demands for the human consumer in their attempts to align with Scandi-modern aesthetics. Yet, the solutions for these problematizing occasions, regarding objects, doings and meanings are sought for in digital platforms, which in itself also exhibit agency by resolving problems, mediating, and re-creating the Scandi-modern taste regime. In this way, we have advanced extant knowledge by combining research on socio-material practices and taste in homes (e.g., Arsel & Bean, 2013, 2018; Epp & Price, 2010; Valtonen & Närvänen, 2015) with distributed (animal) agency (e.g., Bajde, 2013; Bettany & Daly, 2008; Bettany & Kerrane, 2011; Smith, 2016; Syrjälä et al., 2016; Syrjälä & Norrgrann, 2018, 2019).

From a managerial viewpoint, we believe that the socio-material practice view that considers how different consumption arenas intersect, offers new ways to understand what constitutes value for customers, and which different kinds of requirements need to be negotiated in specific consumption practices intertwined in a taste regime. Such understanding may offer new business opportunities for companies who manage to take a broader view of the practices surrounding their products and integrate the diverse requirements - for instance practicality and aesthetics - into their offerings. In our empirical context, examples of such include pet products that are positioned as interior design and lifestyle products, or in the marketing communication of a design sofa brand, that emphasizes the fabric's suitability for domestic life including pets and children.

Future research should indeed focus on other co-consuming units, such as parents and children (Thompson, 1996), which would open up not only novel managerial implications but also views to distributed agency. Further, a limitation of the current study is that it has employed visual materials only in a supporting role for interpretation, so future examinations should dig deeper into visual analysis, as pictures are constantly pervading as a larger and more meaningful part of social media communication.

Don't Take My Warm Glow: Unasked Prosocial Gifts Reduce Subsequent Donations

Ekin Ok, University of British Columbia, Canada
Rishad Habib, University of British Columbia, Canada
Karl Aquino, University of British Columbia, Canada

EXTENDED ABSTRACT

Prosocial gifts, defined as *charitable donations made by gift-givers on gift-recipients' behalf, which support a cause rather than benefit the gift-recipient directly*, are growing in popularity, promoted by many prominent non-profit organizations such as World Vision, Plan International, and Oxfam. These organizations enable consumers to donate to their causes as gifts for others. For instance, on Plan International's website, consumers can purchase school supplies for kids in developing countries on someone else's behalf for a variety of special occasions ranging from a birthday, Christmas, or even Valentine's Day (Plan International Canada, 2018).

Also known as "socially responsible gifts" (Cavanaugh, Gino, & Fitzsimons, 2015), prosocial gifts offer a seemingly win-win arrangement for all parties involved. For the gift-giver, they offer a unique and meaningful way to fulfill the task of buying a gift and convey a favorable self-expression as a moral person, while eliciting feelings of warm glow that arise from "doing good" (Andreoni, 1990). They constitute an additional source of revenue for the non-profit organization, enable them to enlarge their potential donor base and increase awareness for the cause they seek to address. A unique aspect of the prosocial gifts is that the direct recipient of the donation (i.e., the beneficiary) is different from the gift-recipient, on whose behalf the donation is made. While the gift-giver's donation is used to provide the beneficiary with the resources they need, the gift-recipient typically receives a personalized e-card that is customized for the gift-giving occasion, notifying them that a donation has been made in their honor. In this arrangement, the gift recipient is presumed to enjoy the indirect psychological benefit of sharing the warm glow (Cavanaugh et al., 2015).

Despite their growing popularity, research on prosocial gifts is limited. To our knowledge, the only academic work on prosocial gifts investigates the interpersonal outcomes of this type of gift-giving, documenting an asymmetry in givers' anticipated and recipients' reported appreciation of them based on social distance (Cavanaugh et al., 2015). Furthermore, the majority of the existing research on gift-giving (including non-prosocial, traditional gifts) targets the relationship between the gift-giver and the gift-recipient. Expanding this focus, our research investigates the consequences of receiving prosocial gifts from the recipient's perspective. We examine how receiving a prosocial gift affects recipients' subsequent involvement with the non-profit organization (i.e., their willingness to donate to and volunteer for the organization in the future). To that extent, it is novel not only for focusing on the relationship between the gift-recipient and the brand (i.e., the charity organization), but also for doing so in the scantly studied domain of prosocial gifts. It also carries managerial relevance for the organizations promoting socially responsible gift-giving practices.

According to impure altruism theory, people are motivated to do good deeds partly because of the emotional benefit and utility they receive from the act of giving itself – a benefit often referred to as "warm glow" (Andreoni, 1990). The concept of warm glow has been applied in a variety of domains in the marketing literature, including work on corporate social responsibility and cause marketing (Krishna, 2011; Habel, Schons, Alavi, & Wieseke, 2016), consumer responses to discount- vs. donation-based promotions (Winterich &

Barone, 2011), and involvement in 'green consumption' programs (Giebelhausen, Chun, Cronin Jr, & Hult, 2016).

Recent research reveals that choosing to give voluntarily and intentionally in the presence of an opportunity to behave self-servingly is necessary for experiencing warm glow (Evren & Minardi, 2017). For instance, Giebelhausen et al. (2016) show that individuals feel greater warm glow when they participate in an eco-friendly program voluntarily, compared to when participation is mandatory. The notion that warm glow is dependent on a sense of agency is also supported by work in neuroscience, which shows that neural activity in the reward processing areas of the brain is highest when giving is voluntary, and thus eliciting "warm glow" (Harbaugh, Mayr, & Burghart, 2007; Tankersley, Stowe, & Huettel, 2007). Based on these findings, we theorize that an important element missing in prosocial gift-giving is the recipients' sense of agency over having made the donation decision. To the extent that agency is a precondition for experiencing warm glow, and that people primarily gain pleasure from heling others when they feel ownership over their good deeds (Berman & Small, 2012), then this experience should not occur when a person receives a prosocial gift, thereby eliminating one of the possible sources of motivation for subsequent engagement with the organization. Importantly, we hypothesize that this effect will occur only when the initial donation is not explicitly requested by the recipient. Figure 1 below shows our conceptual model.
Figure 1. Conceptual Model

In three experiments, we show that when prosocial gifts are not explicitly requested by the recipient, the recipient's future intentions to donate to the organization is lower, compared to when they are specifically requested ('asked condition') or to a 'control condition' that does not involve a gift exchange. This effect is reliable across two different organizations (Greenpeace and a local children's hospital), two distinct gift-giving occasions (birthday and Holidays season), for both money and time donations, and with both MTurk and undergraduate student samples. We also have preliminary evidence that this effect occurs due to a reduction in recipients' feelings of warm glow, resulting from a perceived lack of agency over the donation decision and find that restoring agency can decrease this gap.

Study 1 tested our main hypothesis that receiving unasked prosocial gifts results in lower future donations to the organization. 152 participants from MTurk took part in a three-condition between-subjects study: Unasked gift vs. Asked gift vs. Control. In the control condition participants simply read some information about Greenpeace. In the unasked gift condition, after reading the same information about the organization, participants saw an e-card notifying them that a friend had donated $50 to Greenpeace on their behalf as a birthday gift. In the asked gift condition, prior to seeing the same card and the message as in the unasked gift condition, they were asked to imagine that they had suggested their friends to make such

a donation (instead of a traditional gift) on their Facebook. Next, all participants answered how likely they were to donate money to Greenpeace three months from now (1 = *very unlikely*, 7 = *very likely*). A one-way ANOVA showed that there was a significant difference in the donation likelihood between conditions. The donation likelihood in the unasked condition ($M_{unasked}$ = 2.80, $SD_{unasked}$ = 1.68) was significantly lower than the asked (M_{asked} = 3.92, SD_{asked} = 2.00, p = .003), and marginally lower than the control condition ($M_{control}$=3.48, $SD_{control}$=1.90, p = .07). There was no difference between the control and asked conditions, p =.23.

Study 2 was conducted just before the Holidays season with 162 students, who were randomly assigned to one of two conditions: Unasked vs. Asked gift. Participants were asked to imagine receiving an e-card from a friend who had made a $50 donation to Children's Hospital on their behalf as a Christmas gift. We used the same manipulation as in Study 1: Participants in the asked condition read that they had requested such a donation instead of a traditional gift, whereas those in the unasked condition read that they had not mentioned anything about their preference for such a gift. We then measured their likelihood of donating time (*i.e.,* volunteering at a local fundraiser organized by the hospital) and money in counterbalanced order (on a scale from 1 = *very unwilling* to 7 = *very willing),* and their feelings of warm glow upon receiving the gift, with six items (e.g., *happy*, *proud*, *satisfied, a = .96)*) adapted from Giebelhausen et al (2016). Replicating Study 1, those in the asked condition were significantly more likely to donate time (M_{asked} = 6.08$_{asked}$, SD_{asked} = 1.26, $M_{unasked}$ = 4.81, $SD_{unasked}$ = 1.42 p < .001) and marginally more likely to donate money (M_{asked} = 5.70, SD_{asked} = 1.18, $M_{unasked}$ = 5.09, $SD_{unasked}$ = 1.02 p = .06) than those in the unasked condition. Furthermore, this effect was mediated by feelings of warm glow: Those in the unasked condition reported feeling less warm glow, resulting in lower intentions to donate time (B=.34, 95%CI =[.09, .62]) and money (B=.37, 95% CI= [09,.67] to the organization in the future.

Study 3 (N=229) provides further evidence for the role of agency driving our effect. We employed the same materials and procedure as in Study 1 (donation to Greenpeace for the recipient's birthday); but added a third condition to manipulate the sense of agency over the donation decision. In this condition ('unasked gift, choice present'), after reading that their friend had made a $50 donation to Greenpeace on their behalf, participants were shown five Greenpeace initiatives (e.g., Protecting Our Oceans, Living Toxic-Free) and were asked to select which specific initiative(s) they would want the donation to go towards. Participants in the other two conditions (unasked gift and asked gift) saw the same list of initiatives but were not allowed to choose specific ones. In this study, in addition to the same warm-glow items from Study 2, we also included questions on perceptions of choice restriction and controlled for participants' prior attitudes toward Greenpeace. Finally, all participants indicated their likelihood of donating money and time to Greenpeace three months from now.

Likelihood of Donating Money. An ANCOVA on the likelihood of donating money with experimental condition as the independent variable and liking for Greenpeace as a control variable revealed that condition marginally affected participants' reported donations, F(2,225) = 2.49, p = .085. Liking for Greenpeace was also a significant predictor, F(1,225) = 45.14, p < .001. We find that the unasked choice absent condition (M = 4.10) led to significantly lower likelihood of donations than the asked condition (M = 4.94), F(1,225) = 4.97, p = .027. The unasked choice present condition (M = 4.53) was not significantly different from the asked condition, F(1,225) = 1.14, p = .29, thus eliminating the negative effect of a lack of choice.

Likelihood of Donating Time. An ANCOVA on likelihood of donating time with experimental condition as the independent variable and liking for Greenpeace as a control variable revealed that condition significantly affected participants' reported donations of time, F(2, 225) = 4.56, p = .01. Liking for Greenpeace was also a significant predictor, F(1, 225) = 34.14, p < .001. We find that the unasked choice absent condition (M = 3.95) led to significantly lower likelihood of donating time than the asked condition (M = 4.97), F(1,225) = 9.11, p = .003. The unasked choice present condition (M = 4.62) was not significantly different from the asked condition, F(1,225) = 2.45, p = .12

Restriction of Choice. We also predicted that there would be differences in feelings of choice in the three conditions. We conducted an analysis of covariance (ANCOVA) on feelings of choice with experimental condition as the independent variable and liking for Greenpeace as a control variable. Condition had a significant effect on feelings of choice restriction, F(2, 225) = 21.59, p < .001. Liking for Greenpeace was also a significant predictor, F(1, 225) = 7.04, p = .009. We find that the unasked choice absent condition (M = 6.83) led to significantly higher perceived restriction of choice than the asked condition (M = 4.81), F(1,225) = 40.08, p < .001. The unasked choice present condition (M = 6.26) was also significantly higher than the asked condition, F(1,225) = 21.72, p < .001.

Warm Glow. We conducted an analysis of covariance (ANCOVA) on feelings of warm glow with experimental condition as the independent variable and liking for Greenpeace as a control variable. Condition had a significant effect on feelings of warm glow, F(2, 225) = 8.21, p < .001. Liking for Greenpeace was also a significant predictor, F(1, 225) = 45.16, p < .001. We find that the unasked choice absent condition (M = 4.34) led to significantly more negative emotions and thus lower warm glow than the asked condition (M = 3.40), F(1,225) = 16.07, p < .001. The unasked choice present condition (M = 3.85) led to more negative emotions than the asked condition, F(1,225) = 6.23, p = .01.

Mediation through choice and warm glow. To determine whether choice and warm glow mediated the effect of prosocial gift condition on intentions to donate, we conducted mediation analysis (Hayes PROCESS Model 6 with condition coded as a categorical variable and liking of Greenpeace as a covariate). Compared to the unasked choice absent condition, we found a significant indirect effect on intentions to donate money through choice and warm glow for the asked condition ($b_{indirect}$ = .57, 95% CI = [.33, .87]). Indirect effects through only choice (95% CI = [-.18, .49]) or warm glow (95% CI = [-.17, .69]) alone were not significant. The reverse serial mediation where condition predicts warm glow, choice and then donations was not significant ($b_{indirect}$ = .04, 95% CI = [-.05, .15]).

A recent survey conducted with 1000 Canadians revealed that 62% of Millennials and Gen Z adults reported interest in giving a prosocial gift in the next year (Plan International, 2019). Academic research on this increasingly popular form of gift-giving practice is currently scant, and no work to date has explored the downstream consequences of receiving prosocial gifts on recipients' subsequent involvement with the organization. In three studies, we show that receiving prosocial gifts that one did not explicitly request hinders agency perceptions and feelings of warm glow, which results in lowered intentions to donate money and time to the organization in the future. Our findings offer substantial managerial importance for the organizations that promote this type of gift-giving practice, particularly since we provide evidence that receiving such gifts may backfire when they are not explicitly requested by the recipient. We also demonstrate a theoretically consistent and managerially relevant

way to restore gift-recipients' sense of agency to minimize their negative reactions to receiving prosocial gifts.

How do we Measure the Impact of Word-of-Mouth on Social Networking Sites?

Delane Osborne, Curtin University, Australia
Graham Ferguson, Curtin University, Australia
Sonia Dickinson, Curtin University, Australia

INTRODUCTION

Word-of-mouth and social media have been areas of significant research interest during the past decade however in reviewing past research there appears a lack of consistency in exploring its operation and measurement. Furthermore, the majority of social media research has focused on the platforms of emails, reviews, and blogs, with little research focusing on social networking sites. As such, there remains a need for development of a holistic model of the operation of word-of-mouth communications on social networking sites and their outcomes.

WORD-OF-MOUTH ON SOCIAL NETWORKING SITES

With the rapid growth of social media and the introduction of platforms such as review sites, blogs, and social networking sites, word-of-mouth communications are becoming increasingly influential. According to recent statistics, 62% of Australians use social media each day, with 23% using such sites for the purpose of retail research (Yellow 2018). These social media sites facilitate the exchange of electronic word-of-mouth communications not just from one person to another, but from one person to thousands of others. These 'one-to-many' communications can take many forms including 'Tweets' and replies on Twitter, posts and comments on Facebook, comments on blogs, and location based 'check ins'. Redsicker (2013) explains, "when a Facebook user sees that her friend has checked into a particular store, she'll be curious to learn more about that location and will probably click through for more information". With the expanding capabilities of social media sites, interpersonal influence now has the potential of occurring without written communication even taking place. For example, when Facebook users acknowledge a positive association with a brand or company by 'liking' their page, when Twitter users 'retweet' a communication by another user, or when Instagram users post photos of products. According to Chitty, Hughes, and D'Alessandro (2012, 177), "86% of Australian internet users contact other internet users seeking their opinions and information about products, services and brands". The way in which consumers behave post-purchase or post-consumption has also greatly changed with the emergence of social media with consumers now publicly rating and evaluating their experiences with products and services.

Social networking sites such as Facebook are becoming increasingly popular among young adults who utilise the sites to communicate with others and express themselves through sharing content such as photos and music and comments about products and brands. Whilst the primary motive for using social networking sites is to keep in touch with family and friends, some interesting consumption related motives have also emerged (Yellow 2018). According to a recent survey, 28% of users cited 'to follow or find particular brands or businesses', 22% of users cited 'to research products / services you might want to buy', and 10% of users cited 'to provide reviews / blogs about products you have bought' as reasons for use (Yellow 2018). The 22% of people who cited 'to research products services you might want to buy' as a main motive for use were asked to list the types of products they typically search for with results showing popular items include clothing and fashion, appliances and electronic equipment, furniture / homewares, trade services, cosmetics and beauty products, health and medical services, and computer hardware and software (Yellow 2018). Additionally, 59% of respondents indicated that the last time they used social media for the purpose of researching a product or service it resulted in a purchase (Yellow 2018). As such, interactions that take place on social networking sites can have a powerful influence on consumption behaviour and thus, understanding the nature in which consumers are communicating on social networking sites is paramount for marketing practitioners.

RESEARCH GAPS

Upon review of past studies in the research areas of word-of-mouth and social media, it is evident there exist several gaps in the literature that support the need not only for further research but additionally for development of a holistic model in order to measure influence. The first of such gaps relates to incorporation and measurement of the various antecedent and moderating characteristics of word-of-mouth communications. Despite being acknowledged as significant moderators of influence from word-of-mouth communications, receiver characteristics such as prior knowledge, personal involvement, and personal expertise are often neglected. As Subramani and Rajagopalan (2003) highlight, additional research is also required into product characteristics that can affect the influence of communications such as the level of involvement and the nature of the product (hedonic / utilitarian). Whilst numerous word-of-mouth studies have acknowledged the interaction of combinations of characteristics, such as sender and receiver characteristics (Bone 1995; Fan and Miao 2012), sender and message characteristics (Jalilvand, Esfahani, and Samiei 2011; Lee and Koo 2012; Li and Zhan 2011; Schindler and Bickart 2012), receiver and message characteristics (Floh, Koller, and Zauner 2013), sender and product characteristics (Smith, Menon, and Sivakumar 2005), and sender, message, and product characteristics (Adjei, Noble, and Noble 2010), there remains a lack of research incorporating all of these factors and the numerous variables within them. Secondly, whilst outcomes such as perceived influence, purchase intention, and share intention have been explored in past studies, they have typically only been measured by a single item and / or measured in conjunction with other behavioural intentions. As single item measures have low reliability and may not capture the total concept of the variable, further studies should engage in more rigorous testing of these variables, utilising separate multi-item constructs to measure each unique outcome. Lastly, whilst social media and electronic word-of-mouth studies have explored the effectiveness of various platforms such as emails (Shabsogh, Liao, and Reynolds 2012), reviews (Cheung and Lee 2012; Park and Kim 2008; Park and Lee 2009), and blogs (Chu and Kamal 2008), no previous studies have examined the effectiveness of social networking sites as a platform for word-of-mouth communications. Thus, research into social networking sites and the various forms of communications within them is required.

SOCIAL NETWORKING SITE WORD-OF-MOUTH FRAMEWORK

Drawn from the review of past research on the operation of word-of-mouth and the subsequent research gaps identified, Figure 1 proposes a holistic conceptual framework of the operation of word-of-mouth communications on social networking sites.

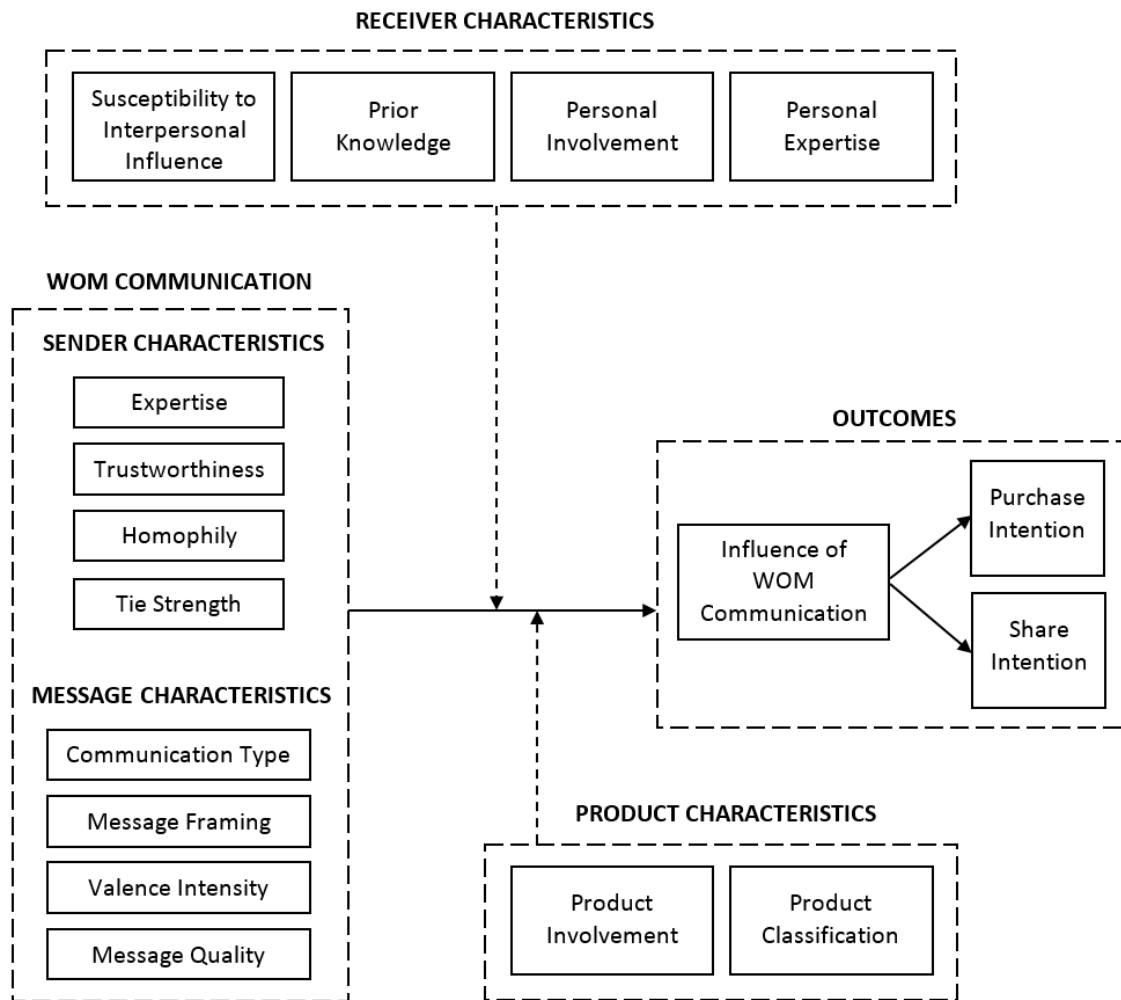
RECEIVER CHARACTERISTICS


Figure 1: Framework of Social Networking Site Word-of-Mouth Communications

Sender Characteristics

Whilst previous studies have identified the sender characteristics of expertise, trustworthiness, homophily, and tie strength as antecedents to influence from word-of-mouth communications, they have typically only tested combinations of one or two characteristics, for example, expertise and homophily (Gilly et al. 1998), expertise and tie strength (Bansal and Voyer 2000), and homophily, expertise, and trustworthiness (Shabsogh, Liao, and Reynolds 2012), and not all four characteristics. Additionally, whilst the four sender characteristics have been found to be positively related to influence for traditional word-of-mouth communications (Bansal and Voyer 2000; Brown and Reingen 1987; Gilly et al. 1998), electronic word-of-mouth studies haven't always confirmed this with Airs and Ang (2012) finding no significant relationship for homophily and Steffes and Burgee (2009) finding no significant relationship for tie strength. As traditional word-of-mouth originates from a sender known to the receiver, their credibility can by evaluated however due to the nature of electronic word-of-mouth, the anonymity of senders doesn't facilitate this evaluation given the weak tie strength of strangers. As communication exchanges on social networking sites are more representative of traditional word-of-mouth than electronic word-of-mouth due to receivers' existing friendship with the sender, it is anticipated that as with traditional word-of-mouth, all four sender characteristics will be positively related to influence for communications exchanged on social networking sites.

Message Characteristics

Message characteristics refer to aspects of the actual message being communicated, independent of the characteristics of the sender and receiver. Four key characteristics of messages are acknowledged as impacting the level of influence of communications; communication type, message framing, valence intensity, and message quality. Communication type refers to the means by which a message is communicated from a sender to a receiver (e.g. review, comment, share, like, etc.). Message framing refers to whether the communication is written in a positive or negative tone whilst valence intensity, also referred to as argument quality or argument strength, refers to the persuasive strength of arguments contained within word-of-mouth communications (Cheung and Thadani 2012). Valence intensity has been found to play a significant role in the level of influence of word-of-mouth communications with stronger messages bearing greater influence than weaker messages resulting in stronger responses (Floh et al. 2013). Message quality refers to the content of a communication (the information it provides) and the style in which it is written (Schindler and Bickart 2012). Communications can vary in length and nature (objective / subjective, evaluative / descriptive) and are subsequently classified as either high or low quality (Lee, Park, and Han 2008). Past research has found a positive relationship between communication quality and influence with high quality communications found to have a greater impact on consumers purchase intentions (Lee et al. 2008; Park, Lee, and Han 2007).

Receiver Characteristics

Moderating the level of influence of word-of-mouth communications are the receiver characteristics of susceptibility to interpersonal influence, prior knowledge, personal involvement, and personal expertise. The susceptibility to interpersonal influence construct is derived from influenceability theory which purports that individuals respond differently from one another in the presence of social influence (Cox & Bauer 1964). Janis (1954) cites early studies that suggest some individuals are highly amenable to social influence whilst others are predisposed to be resistant. Based on this theory of differences in response to social influence, it is possible that two individuals could receive the same message however be influenced differently dependent upon their susceptibility to interpersonal influence rendering it an important factor to control for when measuring influence from word-of-mouth communications. Prior knowledge refers to a receiver's prior knowledge of or familiarity with a product or brand and is based on consumers' memories or known knowledge (Shirin and Kambiz 2011). When receivers have no prior knowledge of a product, they are more likely to be receptive of information regarding the product (Bansal and Voyer 2000). However, if they are familiar with the product and hold existing attitudes towards the product then they will be less affected by word-of-mouth communications (Bansal and Voyer 2000). Receiver's personal involvement refers to the importance an individual places on a product and describes the feelings of interest and enthusiasm consumers hold toward product categories (Goldsmith and Emmert 1991). High-involvement consumers may be more influenced by word-of-mouth than low-involvement consumers who may be less attentive if they do not consider the product to be important (Skourtis et al. 2012). Due to this, personal involvement is recognised as a significant moderator of the influence of word-of-mouth communications (Skourtis et al. 2012; Wu and Wang 2011). Personal expertise refers to the extent to which an individual perceives themselves to be knowledgeable, competent, trained, and experienced in relation to a particular subject (Adjei et al. 2010). Consumers who consider themselves as having greater expertise are likely to place less value on information provided by others and thus be less influenced by information received (Adjei et al. 2010). Conversely, consumers who consider themselves less informed regarding a product acknowledge the need for additional information and thus are more likely to be influenced by information received (Adjei et al. 2010).

Product Characteristics

An additional important factor to consider when exploring the influence of word-of-mouth communications is the moderating effect of the type of purchase decision the communication relates to. Purchase decisions can be classified according to the level of product involvement (high or low) and whether the products being purchased are considered to be hedonic or utilitarian (Stafford, Stafford, and Day 2002). Product involvement refers to the effort consumers exert in the decision making process prior to purchasing a product (Solomon et al. 2014). Due to the increased risk and more complex nature of the decision making process for high involvement products, consumers typically seek out more information before purchasing these types of products than they do for low involvement products (Lovelock and Wirtz 2007). Products can be classified as being either utilitarian or hedonic in nature (Botti and McGill 2011). Past research has found that the influence of word-of-mouth communications differs dependent upon whether the product being reviewed is of a utilitarian or hedonic nature (Sen and Lerman 2007).

Outcomes

The outcomes of a communication are described by Hovland (1948) as how the behaviour of the receiver is modified following receipt of the communication. The first outcome is that of influence as a receiver must first be influenced by a communication for it to lead to behavioural change (Smith et al. 2005). If a receiver doesn't pay attention to a communication or receives a communication but ignores it, no behavioural changes will be effected. Once a communication has been acknowledged as having an influence on the receiver, the resultant behavioural outcomes can be explored. Purchase intention is defined as an individual's willingness to purchase and perceived likelihood of purchasing a particular brand, product, or service (Rezvani et al. 2012). Past studies have generally found a positive relationship between word-of-mouth communications and purchase intention; that positive word-of-mouth has a positive impact on purchase intention and negative word-of-mouth has a negative impact on purchase intention (Jalilvand and Samiei 2012; Skourtis et al. 2012; Sparks and Browning 2011). Whilst many word-of-mouth studies have examined purchase intention as an outcome, few studies have focused on share intention or willingness to recommend. Furthermore, whilst some studies have measured willingness to recommend, it has typically only been measured by a single item in conjunction with other behavioural intentions such as purchase intention. Share intention is an important outcome to include in word-of-mouth research as whilst receivers' purchase intentions may not be influenced, they may share the communication with others who in turn may be influenced, termed amplification (Lipsman et al. 2012).

CONCLUSION

This study contributes theoretically to the existing body of knowledge on social influence through conceptualising a holistic model of the operation of word-of-mouth on social networking sites. Whilst previous studies have acknowledged and tested varying combinations of outcomes and sender, message, receiver, and product characteristics, none have expanded on this to develop a holistic model encompassing all of these variables nor anything capable of accurately measuring the word-of-mouth effect on social networking sites. As such, this framework will prove useful for marketing practitioners in understanding how consumers are influenced by one another on social networking sites.

How Mother-Daughter Purchase Interaction Affects Daughter's Situational Self Construction in Japan

Mototaka Sakashita, Keio University, Japan
Junko Kimura, Hosei University, Japan

INTRODUCTION

During major transitions between life stages, consumers are often required to act properly in a new environment that is totally different from the previous one (Andresen 1984). It is assumed that consumers try to project what they consider the most appropriate self-image in each of these transitions, but face a variety of difficulties in doing so. This is partly because they cannot decide which ideal self-image they should project in the new role in a totally unknown environment.

Faced with this transitional stage, a daughter often determines her ideal situational self through dynamic interactions with her mother. The specific consumer behavior context we focus on is the catalogue shopping in the cultural sphere of Japan, where the mother-daughter relationship is unique. We anticipated that a Japanese daughter is often controlled by her mother who acts as a significant other for her daughter. In these situations we expected that a mother tries to determine her daughter's ideal self-image by exerting control over her daughter, while the daughter is willing to accept her mother's control to a certain degree. This study aims to explore the diversity of a daughter's situational self construction, particularly from the viewpoint of her dynamic interactions with the mother. By stressing the importance of the role of the interfamilial relationship, the concept of situational self can be further refined.

THEORETICAL BACKGROUND

Situational Self

Situational self is defined as "the meaning of self an individual wishes others to have of him/herself (Schenk and Holman 1980, 611)." One's self image — how he/she wishes to be seen by others — differs in different environments (Hollenbeck and Kaikati 2012). Thus, consumers are thought to engage in acts of possession of consumption objects based on the self image that is suitable to the particular environment (Belk 1988).

There are various types of situations that effect consumers (Belk 1975) who are known to select a brand among a variety of choices in accordance with those situations (Bettman, Luce, and Payne 1998). Consequently, consumers' brand selections become diversified according to the situation. This diversification of brand selections is partly attributed to the rise of a corresponding situational self (Schenk and Holman 1980). This differs from the notion of plural self, in which multiple selves are seen to arise across situations (Ahuvia 2005; Bahl and Milne 2010).

The study of the situational self has been concentrated on the explanation of the brand choice. While there have been a number of studies on how situational self affects consumers' behavior (Belk 1974; Bishop and Witt 1979; Lutz and Kakkar 1975), there have been few studies of how situational self itself is constructed. Therefore, this article argues for the importance of anatomizing the situational dependency of choice phenomena in the context of interpersonal relations by examining different situations creating different ideal self images. We refine the concept of situational self by focusing on the process of the situational self construction within the special relations between a daughter and her mother in Japan. Since self-concept is believed to account for behavioral patterns, it is critical to the study of consumer behaviors (Onkvisit and Shaw 1987).

Coercive Nature of Mother-Daughter Relationship in Japan

While others in general are believed to influence the construction of one's self concept, the others that affect self-development are called *significant others* (Mead 1934). For children, their parents are significant others and mothers are particularly important significant others especially for daughters (Surry 1985; Bohannon et al. 1999).

It has been stressed by a number of scholars that parents help their children's process of socialization (Moschis and Churchill 1978; Roedder John 1999; Sullivan 1947; Turner 1962). Socialization refers to the process through which an individual acquires communally influenced values, attitudes, skills, knowledge, and motivation through interactions with others and, thus, form a pattern of thinking. The family unit generally plays the most influential role in preadults' socialization process (Ward 1978), and mothers' roles are believed to be particularly influential in socializing their daughters in terms of attitudes (Acock and Bengston 1978; Gentina, Huarng, and Sakashita 2018). Daughters, in turn, internalize a large portion of their mothers' behavior, values, thinking, and meanings. By internalizing these properties, they can become like their mothers (Boyd 1989; Chodorow 1978), who, in many cases, present a primary consumption model for their daughters (Gavish, Shoham, and Ruvio 2010).

Mother-daughter relations are particularly close in Japan (Doi 1971; Gentina, Hogg, and Sakashita 2017), which is reflected in their consumption behaviors. It is not unusual for grownup daughters to go out shopping with mothers as if they were friends (Gentina et al. 2018), and this attracts much attention of both marketers and mass media in Japan. Doi (1971) uses the concept of *amae* (dependency) to explain the Japanese trait of depending on others. *Amae* is a concept that means *dependence* and, according to Doi (1971), it is typically found in an infant's inclination to seek an intimate contact with its mother. In Japan, *amae* is not confined only among infants and is also found in children and even in grownups (Clammer 1997; Takemoto 1986).

Occasionally, daughters are coerced to be like their mothers (Weitzman 1984), or led to accomplish the failed dreams of mothers for their sake (Sakashita and Kimura 2010). Mother-daughter relations are maintained while daughters internalize mothers' values and, at the same time, pursue their self-development.

Considerate Nature of Mother-Daughter Relationship in Japan

Mother-daughter relations in today's Japan, however, cannot be explained solely in terms of a daughter's simple dependence on her mother. A daughter often appears to be devoid of self-reliance in her interactions with her mother; however, it is not a simple dependence and, on the contrary, it is actually an attempt by the daughter to actively help her mother (Maeda 2008; Takemoto 1986). For instance, Maeda (2008) reports on a case in which what appears to be a daughter's financial dependence on her parents turns out to be the parents' attempt to hold on to their daughter by financially assisting her. This is a case of parents-dependent-on-their-child, the total opposite to the presumably ordinary pattern of children depending on their parents. What is stressed here is the attitude of the daughter who actively tries to help her mother instead of passively depending on her mother.

What is implied by these prior studies is that there is a diversity of mother-daughter relations in contemporary Japan. In general, it is known that mothers try to control their daughters through the process of socialization (Gentina et al. 2018), while daughters generally accept their mothers' control through an internalization process. This phenomenon, however, cannot be explained only as a simple and unilateral dependence of the daughter on the mother. As revealed by Nobuta and Ueno (2008) as well as Maeda (2008), there also are cases in which daughters willingly try to help their mothers hold on to them. Mother-daughter relations in Japan are, indeed, diverse and so are the attitudes of daughters in these interactions.

PROPOSITION

Based on above discussions, we propose the following proposition:

In a daughter's situational self construction process, the mother as a significant other tries to interfere in the process by exerting control over the daughter, while the daughter tends to accept the control by mother. However, this control-acceptance interaction can take two different patterns, either dependency-oriented or consideration-oriented, since mother-daughter relations are highly diverse.

METHOD

The complex interplay of individual, relational, and collective identity practices tends to be neglected by family researchers (Epp and Price 2008), thus the present study employs a unique method to overcome this limitation. Specifically, relying on the interpretive approach, it aims to comprehensively understand mother-daughter relations by combining observation of the video recordings of actual purchasing processes on one hand, and multiple qualitative data collected through subsequent semi-structured depth interviews on the other. In high-context cultures like Japan, people tend not to speak out their thoughts; instead, they often use non-verbal communication, such as nodding, staring, hand gesticulations, and so forth (Hall 1976). Hence, the present study tried to collect and interpret not only the explicit verbal data, but also the implicit non-verbal communications.

In order to grasp the uniqueness of mother-daughter relations, six mother-daughter pairs were recruited and requested to conduct catalogue shopping using fashion magazines. The six mother-daughter pairs were requested to browse a fashion magazine together and talk freely about fashions as they normally do, to choose one outfit to be purchased, which they believed would change the current image of the daughter. We chose the catalogue shopping situation because it would allow us to collect an abundance of qualitative data on mother-daughter interactions in a relatively natural environment.

After the item to be purchased was decided, mother-daughter pairs were interviewed on the catalogue shopping they just enacted, and their usual fashion-related behaviors. In the interview, the mother and the daughter were asked questions together, so they were aware of being heard by the other person. Since the purpose of the present study is to cultivate a better understanding of the puzzling mother-daughter relationship in Japan, this unique data collection method was employed so that the data better reflects the true nature of the relationship, leaving more genuine and realistic interaction data compared to individual data collection in isolation.

All six daughters were junior or senior college students of 22 or 23 years of age, who were in stages of preparation for employment after graduation. Therefore, selection of the outfit to change their images that they were requested to make in the study was in preparation for the major turning point in their life, employment. The six pairs spent between 30 to 40 minutes to choose an item to be purchased

from the magazine, followed by post-choice interviews which lasted for about one hour. Each pair was presented with the honorarium of \10,000 (about US$95) which was the contribution toward the actual purchase of the item they chose. To record the entire process of catalogue shopping and the interview, two video cameras were employed. In order to ensure the credibility of data, four independent coders, separate from participating researchers, were employed to transcribe collected verbal and non-verbal data, which were checked several times by the two researchers.

DESCRIPTION

This section is devoted to interpretation of the qualitative data we collected. Overall, it was confirmed that mothers tried to control their daughters, while the daughters were trying to construct a self image that was suitable to the situation. Anxious about their uncertain futures, daughters were willing to accept the ideal self that their mothers suggested to them, but the control-acceptance pattern was highly variable among informants.

More specifically, the following four patterns were observed. First, *dependency-oriented acceptance*, in which the daughter, who was totally dependent on her mother, accepted mother's control so that she herself could be carefree. In this pattern, the daughter was often a passive being and simply followed her mother's advice; therefore, this was named the *Meek Maid*. On the contrary, daughters sometimes showed greater agency and a more active trait, carefully evaluating her mother's guidance in deciding whether to accept it. This pattern was named the *Discreet Follower*. In addition to these two dependency-oriented patterns a second basic pattern involved *consideration-oriented acceptance*, where the daughter was willing to accept her mother's control, fully aware that her mother was trying to impose her own preferences on her. In this case, sometimes daughters showed passivity, gently letting their mothers take control; therefore, this pattern of acceptance was named the *Thoughtful Sympathizer*. However, in some other cases, they actively chose to depend on their mothers for the mothers' sake, fully aware of the mothers' wish to control them, which was beyond a simple dependence on mothers. This pattern of acceptance was thus named the *Cheerful Altruist*. Table 1 summarizes the four patterns with corresponding verbatim with non-verbal communications.

DISCUSSION

Implications

We believe the present study makes the following three theoretical contributions. First, by calling attention to the importance of interpersonal relations in the situational self concept, the present study has contributed to the refinement of the construct. While situational self concept has been regarded as an explanatory factor for the brand-choice diversity, the present study has succeeded in highlighting its dynamic nature by focusing on the construction process of situational self itself. At the same time, the present study indicates that the process of situational self construction is affected by subjects' relations with a significant other. This is why we focused on collecting data in a pair-wise setting, rather than individual-based interviews. Based on this finding, the present study stresses the importance of exploring the situational dependence of the situational self construction process itself.

A second contribution is related to the finding that even when the mother and the daughter appear to make a similar selection behavior, their perceptions and thinking can be totally different. Intergenerational research generally suggests that many forms of influence are transmitted from parents to their children (Moore, Wilkie

and Alder 2001; Moore, Wilkie and Desrochers 2017; Moore, Wilkie and Lutz 2002), and prior studies (Boyd 1989; Chodorow 1978) point out how parents' behavior, values, thinking, and meanings are passed on to children and this is particularly noticeable in the case of mothers' socialization of their daughters. Findings obtained through interpretations of qualitative data in the present study imply, however, that the phenomenon of child's socialization by parents can no longer be understood in the simple schemes of the past.

Thirdly, the present study makes an important contribution to the understanding of complex relations between mother and daughter in Japan. It has shown that it is possible to describe and interpret subjects' behaviors more accurately by combining an original observation method, which enables data collection in more natural environment, and a post interview. As findings of the present study reveal, the influence of mother-daughter relations during the daughter's situational self construction process can be grasped only through the dynamic interactions between them due to the uniqueness of these

informative, focusing on different life stages such as marriage, child birth, and divorce.

Moreover, it should be recalled that consumers are not only enmeshed in mother-daughter relations, the main subject of the present study, but also in many other relations, including friends, lovers, relatives, and peers. Considering that the situational self construction process itself is affected by interpersonal relations that consumers have, it would be highly valuable to make a similar exploration into other relations than the mother-daughter relations. It is hoped that further studies will be made on the role of interpersonal relations in the situational self construction process.

DATA COLLECTION INFORMATION

The first and second authors jointly collected all the data in the spring of 2008, supervised the data documentation by research assistants at Sophia University, and interpreted the data.

Table 1: Acceptance Patterns and Corresponding Verbatim with Actions (in parenthesis)

	Dependency-Oriented Acceptance	Consideration-Oriented Acceptance
Passive	**Meek Maid** *Nana: (stares at her mother) I almost always go shopping with my mom. (stares at her mother)* *Mother V: Right, she can't make a decision by herself. (stares at her daughter)* *Nana: That's right. I can't make a decision by myself. Ha-ha. (laughter)* *Mother V: (laugher)* *Interviewer: (laughingly) Is that right?* *Nana: Because I can't make up my mind alone, it's the easiest when my mom is with me.*	**Thoughtful Sympathizer** *Eri: Ha-ha. (laughter) How about this one? (asking for Mother W's reaction)* *Mother W: Well, this can go with so many things. I think it's good. You don't think so? (asking for Eri's reaction) (staring at Eri)* *Eri: No, no. I think it's good, too. It's cute (pointing at the outfit).* *Mother W: It goes well with everything.* *Eri: What color? Grey? (asking for Mother W's comment)* *Mother W: I think it should be black.*
Active	**Discreet Follower** *Interviewer: So, you abuse your daughter's choice roundly? (laughter)* *Eri: Yes, she would say stuffs like "You don't look too good in it."* *Mother W: Isn't it better then to go shopping with me and have my approval? (laughingly)* *Eri: I may be too dependent on you.* *Interviewer: (to Eri) You mean you are too dependent on your mother?* *Eri: Yes. (nods) When we go shopping together, I won't buy a thing before asking for my mom's preferences and approval.*	**Cheerful Altruist** *Interviewer: Did you select this item because you thought it fitted your mother's preference?* *Mother X: (stares at her daughter)* *Mai: Yes, you can say that. Our preferences are so different. When putting post-its, we chose totally different items.* *Mother X: I also chose this one. We both chose this one.* *Mai: I thought I had to select an item that we both liked and picked up this one. But mom said, "This one is better." (pointing at an item) Then I said it should be this one [The one her mother preferred]. (laughter)*

relations. Therefore, our study calls not only for collecting an abundance of qualitative data through similar research methods but also pursuing deep interpretations of data collected.

Limitations and Future Research Directions

While the present study succeeded in anatomizing the dynamic nature of the situational self construction process from the unique perspective of mother-daughter relations, it is not free from its own limitations. It should be noted, first of all, that all the informants in the present study were mother-daughter pairs who live together and maintain relatively intimate relations. Although all the daughters in the present study accepted the choice of outfit to be purchased as the one preferred by their mothers, whether a similar phenomenon can be observed between not-so-intimate mother-daughter pairs needs to be investigated. Also, comparisons to other cultures can be highly

Reward Choice in Multi-Level Loyalty Programs

Serdar Sayman, Koc University, Turkey
Ayse Onculer, ESSEC Business School, France

INTRODUCTION

A loyalty program offers a reward to the customer when accumulated purchases (or miles, points, etc.) reach a certain level. Over $1 trillion worth of miles are accrued worldwide in airline miles, credit card points, and other reward programs (Bonnassies, 2018). Many loyalty programs feature multi-level rewards with different purchase requirements. For example, as a part of its reward program, Walgreens offers gift cards of value $10 for 10K points, $20 for 18K points and so on. The current paper focuses on customers' reward choice in such multi-level programs and examines the role of purchase rate in their choice. In the exemplar case of a program with two rewards (small versus large in value), we propose and provide evidence that frequent buyers are more likely to choose the larger reward than light (infrequent) buyers.

If the loyalty program has a limited duration (or if the customer has a short planning horizon), the only viable option for a light buyer may be the smaller reward (S) since the larger reward (L) is unattainable. However if the buyer can fulfill the purchase requirements for both S and L, the case is not trivial. Even though L represents a better deal in terms of reward size per requirement, S can be received multiple times, first of which will be reached earlier than L. By nature, light buyers face longer times to reward redemption, compared to frequent buyers, and L represents a worse time trade-off for a light buyer. Thus, a light buyer prefers to receive S multiple times even though she could redeem L, whereas a frequent buyer prefers to wait for L.

In the current paper we propose that buyers with purchase rates lower than a certain threshold (referred to as *light* buyers hereafter) would choose S, and frequent buyers would choose L. Data from two experiments (hypothetical coffeeshop and supermarket programs) and an actual loyalty program of a restaurant booking system support our main proposition. In all studies, we find that more frequent / heavy buyers tend to wait for the larger reward, providing a rare practical insight into the role of purchase rate in loyalty programs.

CONCEPTUAL FRAMEWORK

Customer loyalty programs has been a growing area of research in the last decades, especially in economics and marketing. Economists model loyalty programs as a means to facilitate collusion among firms by creating artificial switching costs (e.g. Banerjee and Summers 1987; Klemperer 1987, 1995). Marketing researchers study the impact of loyalty programs on purchase behavior and share-of-wallet (Sayman and Hoch 2014; Meyer-Waarden 2007; Liu 2007), and on firm metrics (e.g. Lal and Bell 2003; Kopalle et al. 2012) as well as the attractiveness of different rewards types for firms (Kim, Shi, and Srinivasan 2001) and for customers (Kivetz and Simonson 2002, 2003). Breugelmans et al. (2015) offers a concise review of loyalty programs research, largely in the domain of marketing.

Despite the interest in loyalty programs, insight regarding multi-level programs is sparse. Multi-level programs can be used for motivating repeat purchases. One motivational argument is that introducing a smaller reward makes it easier for the customer to reach that reward, and this can motivate her to make a purchase at the beginning of the program (Nunes and Drèze 2004). As purchases accumulate, the larger reward also becomes attainable. Presumably, some buyers targeting the smaller reward may continue to accumulate purchases towards the larger goal. Nunes and Drèze (2004) point out that firms introduce a variety of reward levels as customers are motivated by different levels. We interpret this argument as the choice among different rewards being driven by situational factors or non-systematic differences in customer needs.

A second motivational argument is related to the convex nature of the reward structure -- reward value per purchase requirement is typically higher for larger rewards. O'Brien and Jones (1995) propose that larger rewards motivate customers to spend more. This implies that the smaller reward promotes the attractiveness of the larger reward. Empirical research shows that loyalty programs may encourage spending (e.g. Lewis 2004; Kivetz, Urminsky, and Zheng 2006), but it is not clear whether a multi-level reward structure would enhance purchase intention. While the two arguments mentioned above may partially explain why multi-level rewards exist, they cannot predict any systematic differences between customers that choose S versus those that choose L. In this paper, our goal is to provide some insight into the reward choice behavior.

In contrast to the motivational arguments, Sayman and Usman (2016) propose that multiple reward levels are for targeting different segments. The menu of rewards acts as a price discrimination mechanism, because the smaller reward is also smaller on a *per* purchase basis.

The current paper focuses mainly on the link between purchase rate and the choice between reward levels. We consider a firm offering rewards of monetary value S and L to customers when they complete n and $2n$ purchases respectively. Customers can exchange accumulated purchases for a corresponding reward, and continue to accumulate purchases afterwards for another reward. We assume that the program duration and customer's planning horizon are long enough to allow the customer make a choice between S and L. As the requirements for S and L are different, the customer should compare the stream of S versus L rewards over the same duration. The choice problem can be specified as *receiving S twice versus L once in the course of 2n purchases*. However, customers differ in their purchase rate. We propose that a light buyer, who has a purchase rate p below a certain threshold, would prefer to receive S twice whereas a frequent buyer with would prefer to wait for L within the same duration of the program. This constitutes our main hypotheses:

Hypothesis 1:   *Frequent buyers choose L with a higher probability than light buyers.*

Hypothesis 2:   *The average spending per period of customers choosing L should be higher than of those choosing S.*

In the next sections, we test the relationship between purchase rate and reward redemption choices using (*i*) survey-based data involving hypothetical programs, and (*ii*) data from an actual marketplace loyalty program.

STUDY 1

In Study 1 the purchase frequency is manipulated, as light buyers and frequent buyers, and the choice between S and L is elicited. 98 students from a European business school participated in the on-

Table 1: %L chosen in Study 1

	Frequent Buyer (n=51)	Light Buyer (n=48)
%L chosen	72.5%	50%

line study in exchange for course credit. The study employed a two group (Light Buyers versus Frequent Buyers) between-subjects design.

Respondents were presented with a hypothetical scenario about a coffeeshop offering a new loyalty program. In the frequent-buyer condition, subjects were told to imagine that they bought a beverage every morning from this coffeeshop. In the light-buyer condition, they were told that they bought a beverage twice a week from this shop. In each condition, subjects were asked to report their preference between S (a €2 store credit when they buy 5 hot beverages) or

compared to those who chooses the S reward. These results support Hypothesis 2.

To conclude, the results from the two experimental studies provide convergent support for our prediction, i.e. frequent users are more inclined to wait for L, compared to light users. However, the extent to which subjects would prefer redeeming S once or multiple times is not evident in the two experiments. The field data from the loyalty program provides a better insight to this problem since the actual reward redemption history of the participants is recorded.

Table 2: Average Monthly Spending in Study 2

	Monthly Spending in Euros (SD)
L chosen (n=35)	85.65 (61.29)
S chosen (n=31)	51.22[a] (37.18)
Not interested (n=8)	29.25[b] (31.25)

a: significant with $p < 0.01$; *b*: $p < 0.10$; both two-tailed tests.

L (a €5 store credit when they buy 10 hot beverages). They were also given an option to choose "not interested in this promotion".

Table 1 summarizes the results for the two conditions. None of the subjects chose the "not interested" option. In the frequent-buyer (light-buyer) condition, 72.5% (50%) of the subjects chose the L reward. Chi-square test reveals that the preference for L was significantly higher among frequent buyers then light buyers ($\chi^2 = 5.26$, $p = 0.02$). This finding is consistent with Hypothesis 1.

STUDY 2

This study differs from Study 1 in two ways. First, it involves a program based on the purchase volume, rather than the number of purchases. Secondly, the purchase rate (i.e. volume per period) is a self-reported measure, unlike the light / frequent buyer manipulation employed in Study 1. An online survey was conducted at a European university with 89 student participants. For a (hypothetical) loyalty program initiated by the campus supermarket, we asked the participant's choice between two rewards, and monthly spending level from the supermarket.

In the scenario, the campus supermarket (M) offers a gift check of €5 when cumulative purchases amount to €50, or a check of €12.5 for €100 purchases. Participants were told that these checks can be used at any M store, and there is no time limit for the promotion. Furthermore, after qualifying for and redeeming a check, they can accumulate purchases again and receive additional checks. After describing the program, we asked whether they would prefer to receive the €5 or €12.5 check after the respective purchases. We also provided a "not interested" option. The subjects also reported the monetary amount they spend at M in a typical month.

The monthly spending levels of subjects preferring S versus L rewards are presented in Table 2. A significance indicated with a superscript refers to a comparison with the cell above; e.g. the difference between 51.22 and 85.65 is significant at $p < 0.01$ ($t = 3.06$). Subjects preferring L report a significantly higher purchase level compared to those preferring S. In addition, participants not interested in the program spend significantly less compared to those who would participate, i.e. choose S or L, ($t = 3.47$, $p < 0.01$), but not

FIELD DATA

We use the loyalty program data provided by a leading restaurant booking service. The company operates in 11 countries (mostly in Europe), offering reservations at more than 30,000 restaurants. Customers make online reservations at participating restaurants and collect loyalty points. The current dataset consists of reservations from 1240 restaurants in three countries that took part in the loyalty program in a six-month time period. The program consists of a simple two-level structure. Customers get 100 points for a booking. Once they reach 1000 points, they qualify for a €10 discount, and when they reach 2000 points, they qualify for a €25 discount, valid at any participating restaurant. Points earned are valid until the end of the next calendar year, i.e. there is sufficient time to collect and redeem points.

Our dataset consists of the activity data of 3551 customers between July 2014 and February 2015. Only the customers that redeem at least one reward are included in the sample. As an indication of purchase rate (i.e. reservation frequency), we calculated the average duration (in days) between bookings for each customer. For choice, we identified the number of small (€10) and large (€25) rewards redeemed by each customer -- without any consideration of the order of rewards.

Table 3: Duration (Days) between Purchases in the Field Data

# S redeemed	# L redeemed			
	0	1	2	3
0	–	9.2 (3.0) n = 798	7.3 (2.8) n = 165	6.4 (2.4) n = 58
1	15.9 (4.7) n = 2021	8.1 (2.1) n = 73		
2	13.0 (4.4) n = 268			
3	9.6 (3.2) n = 52			

Note: Numbers in parentheses are standard deviations.

Table 3 presents the results for subgroups of customers redeeming different combinations of *S* and *L* rewards. We report (*i*) the number of customers, and (*ii*) the average number of days between bookings for respective subgroups. Empty cells in the lower part of the table have small numbers of participants ($0 \leq n \leq 15$); we purposefully omitted those for a cleaner picture (they do not lead to meaningful comparisons). 97% of the customers are reported in Table 3 (3435 out of 3551). Although the majority of customers redeemed only one *S* or one *L*, other choice patterns are also observed.

At the aggregate level, the average duration between purchases was 13.3 days (SD = 5.3). The longest duration (i.e. the lowest purchase rate) is observed for customers who only redeemed *S* once (15.9 days). The average durations were 13.0 days and 9.6 days for customers who redeemed two *S* and three *S* rewards respectively. The same pattern is observed among customers redeeming one, two, and three *L* rewards (9.2, 7.3 and 6.4 days respectively). In general customers redeeming *S* rewards exclusively (first column) are less frequent users than those redeeming *L* rewards exclusively (first row); average duration for customers who only redeem *S* is 15.4 days (SD = 4.8), whereas it is 8.7 days (SD = 3.1) for those who redeem only *L*. ($t = 48.1$, $p < 0.001$)

Another comparison relevant for the purchase rate - reward choice relationship is between customers who choose one *L* in the given time period, i.e. cell (0,1) in Table 3, versus customers who choose two *S*'s, i.e. cell (2,0). Customers in cell (2,0) choose to get *S* twice even though *L* is achievable for them. Their interpurchase duration is significantly longer compared to customers choosing *L* (13.0 vs. 9.2 days; $t = 13.2$, $p < 0.001$). Furthermore, the combined set of customers in the (2, 0) and (3, 0) cells use the booking service less frequently compared to the customers in the (0, 1) cell (12.5 vs. 9.2 days; $t = 12.2$, $p < 0.001$). These empirical findings are consistent with our hypotheses: The frequent buyers choose *L* more often than light buyers do.

DISCUSSION AND CONCLUSION

This paper proposes that the frequent buyers would be more inclined to wait for the larger reward in a reward redemption choice. This is due to different time trade-offs for different buyers, i.e. even though they choose between the same rewards, time distances to reward levels depend on the purchase rate. Interestingly this intuitive and fundamental link has not been studied by prior research. Our experimental findings and the actual data obtained from a marketplace program show that customers redeeming the smaller monetary reward have a lower purchase rate compared to those redeeming the larger reward. In our field data, this difference was significant even for customers that redeem the smaller reward *multiple times*; these light users can actually qualify for the larger reward.

Future research can examine the reward choices in more detail. For instance, eliciting the discount rates at the individual level may reveal that buyers with a higher discount rate would choose the smaller reward (keeping the purchase rate constant). Another avenue for research could be horizontal differentiation, where loyalty rewards differ not only in terms of monetary value but also in terms of content, such as a $10 restaurant discount coupon (*S*) versus a $25 Amazon gift card (*L*). This kind of differentiation is observed frequently in airline loyalty programs. We expect a variation among buyers in terms of their reward type preferences but there should still be a systematic relationship between purchase rates and reward choices. Such potential variations of multi-level reward programs underscore the need for a deeper investigation of loyalty programs and their impact on consumer choice.

Consuming Commodified Bodies – Performative (Re-)embodiment of Digital Corporeal Consumption

Jonathan D. Schöps, University of Innsbruck, Austria

INTRODUCTION

In a consumer culture obsessed with youth, beauty, fitness, and health, consumers are confronted with visuals of corporeal ideal types, that is, lean, shaped, and muscular, on a daily basis (Borgerson and Schroeder 2018; Carrotte, Prichard, and Lim 2017). Bodies have always mattered (Adelman and Ruggi 2016), but especially in digital environments, such as Instagram, a 'fashionable, fit body' constitutes a commodified object of consumption (Bauman 2005). In numbers, the hashtag #fitness currently accumulates to 238 million posts on Instagram (top-hashtags.com 2020). Thus, visual representations of fitness and fit bodies are central to digital consumer culture on Instagram. Therefore, the question arises – how do consumers re-integrate digital consumption on Instagram into their own corporeal self-understanding?

Prior research investigated visual representations of bodies as other-directed consumption objects, that is, the body as a medium for self-presentation. As such, the body functions as an intermediary communication device conveying desired impressions to others (Jensen Schau and Gilly 2003). Another stream of research focused on self-directed body projects, that is, the body as part of consumers' identity work where consumers form and modify their bodies by various practices, e.g. tattooing (Roux and Belk 2019). However, with ever-increasing digital consumption, these consumption dynamics increasingly become fluid and entangled. Thus, research on digital (disembodied) consumption, and consequential re-integration (re-embodiment) of digitally consumed content into consumers' corporeal self-understanding needs more attention (Adelman and Ruggi 2016).

Correspondingly, this study aims to investigate how digital consumption mediates consumers' corporeality in the context of bodies and fitness on Instagram. Analysis focuses on in-depth narrative interviews supplemented with auto-driven photo elicitation (Heisley and Levy 1991). Findings reveal consumers' embodied, disembodied, and re-embodied consumption dynamics related to the body and fitness. The study closes with discussing findings, and addressing limitations and possible future research.

THEORY

Consuming the body and fitness in postmodern society

In postmodern society, construction of consumers' selves is ephemeral, instantaneous, fluid, and fragmented (Bauman 2005; Schöps 2018). Similarly, the body does not constitute a fixed entity, but one composed of "bits of things" (Cavallaro 1998, 13). As such, the postmodern body poses an object to be continuously worked on through an abundance of new technologies "which are, in turn, produced through […] cultural discourses and people's overt attempts to 'defy' or transform the limitations of embodied reality" (Adelman and Ruggi 2016, 915) – a never-ending compulsive cycle (Bauman 2005).

Digital environments, such as Instagram, become the new playground for the postmodern body. These environments allow consumers to reconcile their corporeality, firstly, by being confronted with images that resemble their desires in a non-physical, disembodied space, and, secondly, by consuming, appropriating, and manipulating digital images (Jensen Schau and Gilly 2003; Schöps, Kogler, and Hemetsberger 2020). Thereby, digital media delimits and breaks

the finitude of embodiment enabling consumers to experience disembodied subjectivity, that is, to leave the embodied self behind (Beetham 2006).

However, digital media also contains uncountable visual representations of fitness regimes. Only those who obey may acquire the "certificate of 'being in', of belonging, of inclusion, of the right of residence" (Bauman 2005, 93). Therefore, individuals not only work their bodies to improve their physical condition, but also their social status in the digital realm. This duality illustrates the paradoxical relationship between fitness and health (Bauman 2005). First, individuals, conditioned that a "lean body and fitness to move […] are the prime cultural tokens of the era of instantaneity" (Bauman 2000, 128), strive for "instant gratification" (Smith Maguire 2002, 455) – harming mental health if absent (Tiidenberg and Gómez Cruz 2015). On the other hand, consumers train fitness to achieve physical and mental health (Glassner 1989). As a consequence, consumers find themselves torn between permanent "self-scrutiny, self-reproach and self-deprecation" (Bauman 2000, 78), and their "daily bustle about health" (Bauman 1992, 141).

Performativity theory

This study draws on performativity theory (Austin 1975; Butler 1990, 1993) to illuminate how consumers consume bodies and fitness on Instagram, and how consumed content affects their own corporeal self-understanding. Performativity theory comprises the notion that "discourse produces the effects that it names" (Butler 1993, 13) by means of reiterative and citational performances. These performances frame the relationship between performer, audience, and actions (Butler 1990). Performative acts encompass practices, language, and visuals that construct reality by exerting intentional (illocutionary) forces that have related intentional or unintentional (perlocutionary) effects (Austin 1975).

In the context of this study, this implies that corporeal performances on Instagram name bodies into being (Butler 1993) – in other words, these performances enact societal discourse that (re-)produces and defines "the materiality of bodies" (Butler 1993, 3). Digital corporeal content then constitutes an intentional (illocutionary) force of its own that, in turn, conveys related types of socially tying consequences – possibly naming and bringing unintended corporealities into being – in this study, consumers' corporeal self-understanding, re-embodiment respectively (Austin 1975; Butler 1993).

METHODOLOGY

This research uses in-depth narrative interviews supplemented with auto-driven photo elicitation (Heisley and Levy 1991) to evoke consumers' meanings attached to the consumption of bodies and fitness. Selection criteria for the applied purposive sample encompassed that interviewees, firstly, were digital natives, secondly, actively trained fitness, and, thirdly, actively engaged with Instagram.

Prior to the interviews, interviewees were asked to provide at least one fitness-related Instagram account of their choice, a visual of themselves working out, and, if existing, a so-called 'body transformation picture.' This projective material was integrated into the interviews eliciting insights into interviewees' embodied meanings of the body and fitness, digital consumption on Instagram, and re-embodiment of digitally consumed content (Figure 1). The sample consisted of 12 German-speaking interviewees (age mean = 24; gender: fe-

male (3), male (9); profession: student (10), clerk (1), self-employed (1); training days per week mean = 5). Interviews lasted from 47 to 101 minutes resulting in 206 pages of verbatim transcripts. Analysis entailed a process of inductive categorization, constant comparison, and abstraction (Kreiner, Hollensbe, and Sheep 2006; Spiggle 1994) to extract central themes from interviewees' narratives.

FINDINGS

Narrative interviews elicited deep insights into the myriad of meanings consumers attach to and derive from (digital) corporeal consumption. The following section offers a detailed account of insights into consumers' embodied, disembodied, and re-embodied consumption dynamics related to the body and fitness (Figure 1).

1989). Interviewees consider fitness as an enabler for persistence in everyday life in general. Lessons drawn from fitness training translate into interviewees' mentality on life per se – helping them to set and pursue life goals, to stay motivated throughout the journey, and to continually grow as a person, as Thomas illustrates:

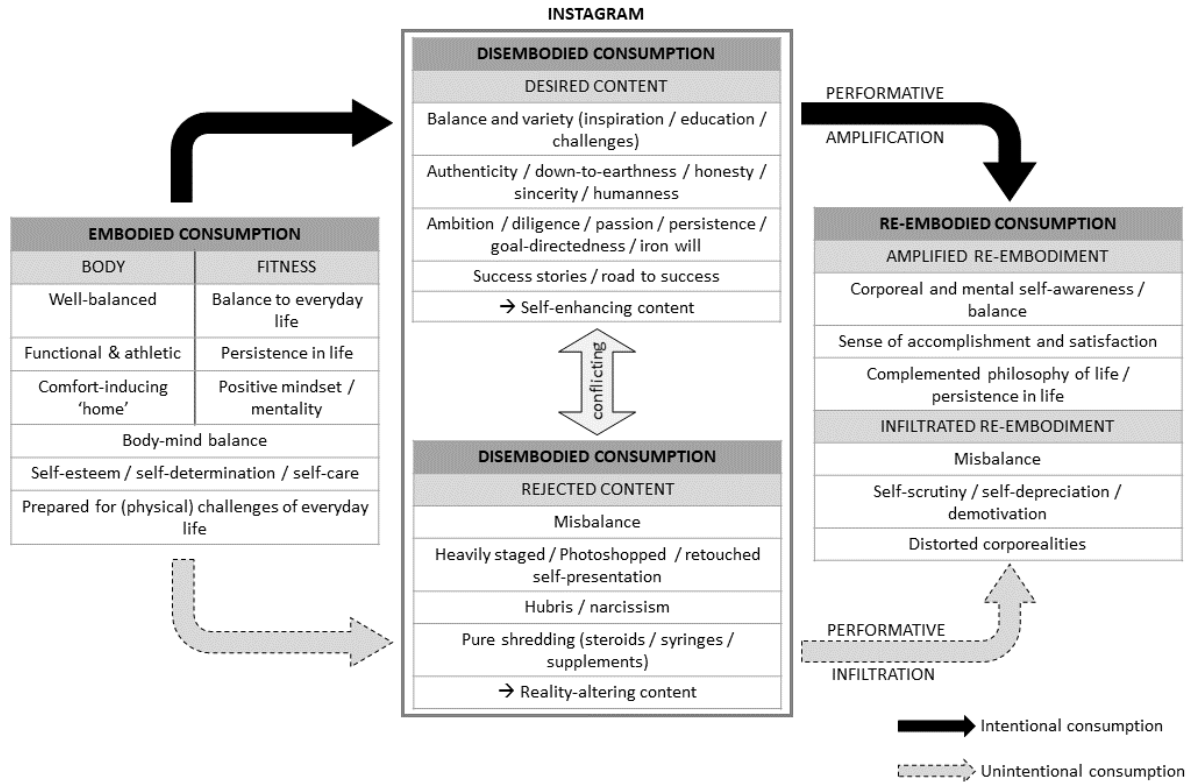
"Fitness influences many other aspects of my life. For instance, my motivation and my goals, that is, that you stay committed to a goal, and never give up. I studied way more consequently, because I knew if I stay committed, and try to develop myself further, I'll achieve success. So, fitness helps me to balance my life, to have a positive attitude towards life in general, but also to mentally recharge myself." (Thomas, male, 27)


FIGURE 1 - DIGITAL CORPOREAL CONSUMPTION DYNAMICS

Embodied consumption

Interviewees first and foremost accentuate the importance of balance with respect to both, body and fitness ideals. The 'perfect body' is not solely a physical, but moreover a mental matter – the body as comfort-inducing 'home' for the mind evoking a sentiment of well-being. Aesthetics still do matter, but a well-balanced – athletic and functional – body, that does not exceed the limits of nature and allows for versatility, is what prevails upon interviewees, as Max elucidates:

"My ideal isn't a bodybuilder in the sense of developed muscles [...]. To me, it's important to look aesthetic. By aesthetic I mean that the muscles are clearly evident but at the same time to be athletic enough, let's say, when I play football to be able to act quickly." (Max, male, 24)

In similar vein, interviewees predominantly train fitness to achieve a balance between physical and mental well-being (Glassner

This balance between physical and mental well-being converts into increased self-esteem and a sense of self-determination, that is, feeling prepared for the (physical) challenges of everyday life (Thompson and Isisag 2018). Moreover, self-determination reflects a self-care mentality linked to the future body, that is, fitness as a means to prevent diseases, e.g. diabetes (Table 1). However, interviewees partially admit their unquenchable thirst for more (Bauman 2005), as *"one can never do enough, there's always more one can do" (Daniel, male, 22)*.

Disembodied consumption

Interviewees' digital corporeal consumption illustrates an immersive, disembodied consumption experience that interviewees delve into – momentarily fading out and altering reality (Schöps 2018). Disembodied consumption dynamics are twofold. Firstly, interviewees experience a sense of detachment from their own corporeality as their digital consumption is other-directed – consuming corporealities of others. Secondly, interviewees rather seek content

Table 1 - Findings

		Additional examples of interview data
Embodied consumption	Body	*"The right balance and mix between an athletic body, but at the same time not too ripped [...] that's the perfect body to me." (Daniel, male, 22)* *"The perfect body is a matter of balance to me. I find it strange if you appear to be a machine par excellence, but almost collapse when you have to climb up like ten stairs. Moreover, this balance is so important to me, because I want to achieve it by myself. And that is why I practice a variety of sports, not only training fitness in the gym." (Ivan, male, 24)* *"When it comes to the body, corporeal well-being is most important to me, because if you don't love yourself then you can't expect others to love you. If you haven't got things straightened out with yourself, the same also applies to your personal surroundings. I remember when I had an injury, I wasn't happy with myself. You interact with your personal surroundings differently when you are happy with yourself; you appreciate your fellows way more." (Sara, female, 25)*
Embodied consumption	Fitness	*"Fitness has not only to do with sports, but with everyday life as well. When you, for example, want to move objects from A to B [...]. You have to find a balance and it may be important to have a certain degree of fitness in order to accomplish it so that you have an advantage in different situations of everyday life." (Alex, male, 24)* *"It [fitness] is extremely important to me concerning various aspects. [...] naturally, the health aspect; to increase life expectancy, and prevent future diseases. But also for balance in general, and well-being. It's very important, because you produce feel-good hormones, you spend active time outdoors, you feel better both, physically and mentally, and you learn lots of things that are important in life in general by doing sports." (Nina, female, 22)* *"Well, to me, fitness is a form of well-being. You don't have to be able to run up the mountain like a marathon runner, but you should just feel well doing it. That you are able to do it without having to lay in bed for the next two days; that you can do what you enjoy without completely exceeding your physical limits." (Sara, female, 25)*
Disembodied consumption	Desired content	*"Tamara [owner of an account] tells us a story. On her account, she tells us how she became the person she's today… from her beginnings until today. She's a young, cheeky, strong, mature and also proud woman. You see where she started and where she came from. She used to be that young, unexperienced girl. I think she has doted on her development… the training. You could accompany her body transformation, and you can also see that she is happy about what she is doing. Those are no 'hardcore' posed photos, but you see a natural human being who went through a process of self-development." (Patrick, male, 28)* *"I feel good following his content, because it eases the burden on me… This restrictiveness that you have to align everything at fitness to achieve your goals. That you can still be a normal human being who can have a [alcoholic] drink or eat a burger sometimes… that you don't have to completely restrict yourself to achieve a fit body, but that you can also skip your regime for one or two days." (Hannes, male, 24)* *"In the caption, he always writes lengthy instruction how you can improve, for instance, when deadlifting… a detailed description of common mistakes, the correct execution even supported by the use of metaphors. He shows lay people how to do it., that's why I consider his account an asset. He provides knowledge to his followers who, in turn, can then reflect on his or her own execution." (David, male, 23)*
Disembodied consumption	Rejected content	*"My personal boundary is everything that has to do with extreme fitness. Everything that exceeds the limits of what is physically doable. Having breast and neck implants, pumping pure poison into your body… full of supplements. No thanks!" (Patrick, male, 28)* *"For instance, these people who have a complete misbalance in their training. When there is a complete mismatch between arms and the rest of the body. You notice that those people don't train for an aesthetic body, but are like 'dude, phat arm. Nice one! Haha.'" [ironic] (Christoph, male, 24)* *"Instagram can also be an illusory world. Some of these people do everything to gain publicity and popularity. Their photos are super staged, retouched, and Photoshopped. That isn't reality. Those people look completely different in real life." (David, male, 23)*

Re-embodied consumption	**Amplified re-embodiment**	*"It [consumed content] always impresses me… it impresses me, and reinforces my own will to go to the gym, to work on myself, to pursue my aesthetic goals, to go my own way. Every human being can achieve his / her goals and objectives if he / she sees his / her goals in his / her mind's eye. If you work hard for a goal, you will get there." (Max, male, 24)* *"I came to the point where I was bored by all this pure fitness drill content. These people follow the same regime over and over… every day… every morning in the gym for three hours. This was the moment for me… a moment of realization. I thought to myself: 'This monotony, these bodies. My versatility, my body.' I made myself aware that it isn't aspirational for me to run to the gym every single day, just to look like them, or to earn a little money with, in my opinion, a short-lived medium as Instagram. Instead, I decided to really enjoy life, stay fit, feel comfortable, even though not having the 'abs of the century.'" (Nina, female, 22)* *"Well, it's interesting in the sense that you may bear in mind that 'if you grin and bear it, and go through with nutrition and fitness and who the hell knows what else, you will maybe achieve such body.' […] But then I remind myself of what lies behind all this, and remember the pressure that I used to feel back in the days. This makes me appreciate and be satisfied with who I am and what I've accomplished. I then think to myself 'yes, it's fine.'" (Sara, female, 25)*
	Infiltrated re-embodiment	*"You are confronted with these 'perfect bodies,' as many people would call it, on a daily basis. I'm sure it affects me subconsciously… my self-perception. Maybe sometimes it motivates me, but at the same time it can be very demotivating. I can well imagine that it's injected into my subconscious, and, thereby, triggers something. By subconsciously I mean that I don't really notice it actively. I don't look at these pictures and say to myself 'hm, now I'm feeling bad' afterwards. But it certainly has an influence." (David, male, 23)* *"I sometimes feel inferior. I think that this is a problem of contemporary society. On the one side, by all of this use of Photoshop, and on the other, by all of these fitness accounts and so on and so forth. People who maybe do not put fitness into the center of their life… All this content reflects on them, and of course on me, too, and leads them to have low self-esteem." (Daniel, male, 22)* *"All this pressure to be fit, to be muscular that you experience all the time… this constant feeling that you are not happy with yourself, not satisfied with your body… Your self-esteem, your self-confidence plummet. This, in turn, makes it hard to look in the mirror afterwards [after digital corporeal consumption], and say to yourself: 'I'm feeling fine.'" (Ivan, male, 24)*

that represents desirable character traits for life in general than fit bodies per se. That is, content of honest, down-to-earth characters who at the same time embody goal-directedness, diligence, ambition, passion, persistence, and iron will (Figure 1). In other words, visual narratives of a balanced life, as Daniel elaborates on his idol Dwayne 'The Rock' Johnson:

"All this hard work… it represents his life in general, because he translates the hard work he puts into his training into all areas of his life […]. Always pushing to the limit, being diligent, respecting one's own body, always continuing, vanquishing the inner temptation, but also maintaining a balance between normal and fitness life. This is exactly what enables you to grow in life in general, in your job, in your leisure time, in your relationship, in your family. It's about the effort you put into things. That's exactly what this account symbolizes to me." (Daniel, male, 22)

Interviewees further seek a balance between inspirational, educational and challenging fitness content, and authentic, genuine and honest content, that is, content displaying, for instance, 'cheat day' feastings (Table 1). Such content aids interviewees to balance their own life as this conveys the message of *"[…] fitness or not – we are still human after all"* (Patrick, male, 28).

However, interviewees also emphasize the often delusional nature of corporeal content on Instagram transmitting distorted corporealities. Interviewees heavily reject staged and Photoshopped content that exhibits hubris and narcissism on the one hand, and content showing misbalanced bodies, that is, recognizably steroid- and supplement-infused bodies, exceeding the limits of the human body on the other, as Max illustrates:

"I see all those pumped up bodies where I'm not sure what kind of supplements they are taking. It's disgusting. That's not aesthetic any more… it's way too much. I can't even tell if it's Photoshopped or if it's injected, because these bodies appear so artificially rendered. All those popped out veins… it couldn't get more disgusting. Utterly disgusting." (Max, male, 24)

Even though interviewees reject the illusory world of Instagram, they are inevitably exposed to the social imagery of Instagram as a whole which, in turn, may affect their own self-understanding (Figure 1).

Re-embodied consumption

Digital corporeal consumption performatively amplifies interviewees' embodied consumption (Figure 1). In other words, interviewees re-negotiate between their embodied self-understanding and digitally consumed content, that is, a performative re-embodiment of embodied and disembodied consumption. As such, interviewees intentionally seek self-enhancing content that functions as a daily reminder and a reflexive mirror (Rocamora 2011) for corporeal and mental self-awareness, reinforces a sense of accomplishment and satisfaction, and complements interviewees' philosophy of life, and persistence in life, as Hannes illustrates:

"It [fitness consumption on Instagram] definitely broadened my horizon with respect to exercises, nutrition, but also life in general. I really noticed that my approach to motivation, and goals and objectives changed, because now I really see those things in my mind's eye... it's something I track on a daily basis by using Instagram. In the past, I didn't have this daily reminder and now I see my goals and objectives in my mind's eye, and I get input how I can achieve those, and how I can improve and grow as a person every day." (Hannes, male, 24)

While fitness-related content on Instagram intents to motivate, educate, and inspire consumers, emphasized by hashtags such as #fitspiration (Carrotte et al. 2017), the consumption of fitness content may also have unintentional (perlocutionary), unconscious effects on interviewees' re-embodied self-understanding (Austin 1975; Prichard et al. 2017). That is, the often distorted reality of Instagram may performatively infiltrate interviewees' corporeality (Table 1). Although rejecting misbalanced forms of bodies and fitness, interviewees are still exposed to such content, e.g. in the explore feed, and may thereby find themselves re-embodying distorted corporealities – yet, unconsciously, and only noticed when being confronted by others, as stated by Anna:

"I worked out so hard... but I developed more into a masculine female instead of shedding weight, and my perception of an athletic body and a good figure became distorted up to the point when my mum said to me: 'Well, now you look like a man. Do you like yourself better now?' This statement made me reflect, and stop all this strength training. I then really tried to consider fitness as means to achieve balance, not bodily perfection." (Anna, female, 24)

Accordingly, re-embodied consumption dynamics are of dual nature (Bauman 2005). On the one hand, fitness-related content offers advice, inspiration, guidance, and aid to re-negotiate the relationship to one's body, fitness, goals and objectives, and life. On the other, it may bring distorted corporealities into being (Butler 1993) by leading consumers to believe that the often 'digitally-botoxed' bodies on Instagram reflect reality (Schöps et al. 2020). Consequently, consumers may find themselves torn between two conflicting, paradoxical 'realities' needing constant reflection and re-negotiation of (re-)embodiment to fulfill their quest for balance.

DISCUSSION

The empirical investigation illustrates how consumers re-negotiate their own corporeality between embodied and disembodied consumption, and how this re-negotiation performatively translates into consumers' (re-)embodied self-understanding. Digital corporeal consumption may have intentional (illocutionary) forces by performatively amplifying consumers' embodied self-understanding, but also unintentional (perlocutionary) effects by performatively infiltrating and distorting consumers' corporeal self-understanding (Austin 1975; Butler 1993). Thereby, this study contributes to an increased understanding of digital corporeal consumption dynamics, and the increasingly entangled and intermingled relationship between on- and offline realities in postmodern society (Adelman and Ruggi 2016).

Consumers in this study find themselves in-between different social realities where the boundaries may be blurred. Consequently, consumers may experience different bodies brought into being (Butler 1993); not only through their embodied self-understanding, but also through finding and (re-)integrating meaning by means of other-directed consumption – in this case digital corporeal consumption on Instagram. Thus, Instagram becomes a performative framework exerting forces and effects of oftentimes conflicting nature (Austin 1975) on consumers moving through its social and cultural imagery. Consumers trying to navigate through this paradoxical realm may only hold their postmodern body together "through finely balancing the tensions that tear it apart" (Bauman 1995, 121). As a consequence, the postmodern body is just as "'socially regulated' as before," but finds a new agency that is "presiding over regulation" (Bauman 2005, 100) in Instagram.

This study has one main limitation. Interviews were conducted at one point in time. Future research drawing on longitudinal interview and visual data could therefore provide deeper insights into consumers' (re-)embodiment of digital corporeal consumption.

A Luxury Moment to Go, Please: Paradoxes of Luxuriousness Among Cosmopolite Consumers

Sarah Schwarz, University of Innsbruck, Austria
Andrea Hemetsberger, University of Innsbruck, Austria

INTRODUCTION

"Just remember, the sweet is never as sweet without the sour."
– Jason Lee as Brian Shelby (2001), Vanilla Sky, film

Technological ubiquity and socio-cultural upheavals have contributed to the advent of nomadic-like consumption orientations that also manifest in nuanced conceptions of luxury. The fluid lifestyle of cosmopolites, who call traditional conceptions of living into question, casts unprecedented light on the paradoxical dynamics of consumption styles—the creative synthesis of heterogeneous oppositions—that are salient in today's fast-moving and multiplex environments. Resonating with what Reckwitz (2017) introduces as singularized society that adheres to a logic of the particular, the neo-community of nomads relates differently to possessions and locations, and values detachment and flexibility (Bardhi, Eckhardt, and Arnould 2012).

Contemporary societies' liquid (Bauman 2000) and singularized (Reckwitz 2017) culture also bears an ephemeral, immaterial, flexible, and self-centering nature of luxuriousness (von Wallpach et al. 2020). This understanding is anchored in recent research on luxurious moments that are pregnant with feelings of elation, imbued with intimate meanings (Hemetsberger, von Wallpach, and Bauer 2012; Holmqvist, Diaz Ruiz, and Peñaloza 2020), and thus evocative of what Csikszentmihalyi (2008) dubbed the mental state of "flow." The liquid relationship between the cosmopolitan consumer and the material world opens a fertile ground for delving deeper into the intricacies of perceptions of luxuriousness in the life of a neo-nomad.

We recognize the need for in-depth reflections on the nascent lifestyle culture of cosmopolites to take the first step toward elucidating the paradoxical character of luxuriousness in singularized and liquid societies. Using a paradox lens, this study develops a grounded theory account of the momentousness of present-day luxury experiences. Consumer narratives of 38 moments exhibit three negotiated, seemingly antithetical dynamics that are caught in a net of mutuality and underlie postmodern luxury perceptions.

THEORY

Luxuriousness in a Postmodern Era

To fathom the present social life, Reckwitz (2017) introduces the logic of singularization as mirrored by the celebration of trueness and otherness within societies. Studies unveiling that consumer cultures seek distinction (Eckhardt and Bardhi 2019), "Anders sein" to counteract communitarian notions of normality (Hemetsberger and Weinberger 2012), or individualism (Tumbat and Belk 2011) hint at the potential of the postmodern marketplace to invigorate singularization. Bauman (2000) points out the epochal shift from the hardware-oriented modernity to the software-oriented postmodernity and introduces the concept of liquidity to epitomize the latter. This transition runs in parallel with processes of cultural, societal, economic, and political change (Inglehart 1997), blurring the boundaries of once-taken-for-granted frames of reference (Bauman 2007). Research unpacks the idea of liquefaction in the realm of consumer behavior, heightening the nomadic logic of consumption that is marked by instrumentality, dematerialization, situation-dependency (Bardhi et al. 2012), and deceleration (Husemann and Eckhardt 2019).

A growing body of research has, in this vein, opened up a debate about the waning power of materials in settings of neo-nomadism (Bardhi et al. 2012; Bardhi and Eckhardt 2017). Eckhardt and Bardhi (2019) highlight that flexibility (adaptability) and attention (visibility) replace possessions as the postmodern status markers, arguing that fluid consumers value authenticity, and accumulate experiences as they fulfill purposes of personal development and differentiation from the outsider. Similarly, recent research ultimately introduces a new notion of luxury that goes beyond the material object (Bardhi, Eckhardt, and Samsioe 2020). Instead of emphasizing possessions that signal prosperity due to their enduring nature (Veblen 1902) or combine a prestige positioning with price premiums to address the mass market (Silverstein and Fiske 2003), luxury is regarded as encapsulated in moments reminding of the logics of liquidity and singularization (von Wallpach et al. 2020).

The Paradox

"Paradoxes stare us in the face" (Schad et al. 2016, 4)—this observation accentuates the ethos of consumption in postmodernity (Firat and Venkatesh 1995) which is symbolized by the figure of the nomad (Bauman 2000). Just as there could be no shadow without light and no light without shadow, paradoxes denote the persistent co-existence of polarities within a unified whole, hence illuminating "two sides of the same coin" (Lewis 2000, 761; O'Driscoll 2008). Cameron and Quinn (1988) herald the opportunity of transcending dichotomous divides by presenting the paradox as a framework to disentangle postmodern complexities (Lewis 2000). We acknowledge this proposition and carve out the potential of the paradox to identify "novel coordinates in a constantly evolving world" (O'Driscoll 2008, 101), assuming that tension fields are the driving source of luxury moments encountered by a neo-nomadic consumer culture. Evidence stemming from a research body in psychology substantiates this paradox view by attesting to the possibility that the synergy between polarities promotes well-being (Tversky and Griffin 1991). This study adopts a paradox lens and, in doing so, attempts not to portray a paradoxical dynamic as the "degraded opposite of logicality" (O'Driscoll 2008, 96) but rather to tap "its enlightening potential" (Lewis 2000, 763).

METHODOLOGY

Based on an interpretive approach, this study employs an interview method inspired by the Zaltman Metaphor Elicitation Technique (Zaltman and Coulter 1995) to surface detailed aspects of paradoxical dynamics hiding behind cosmopolites' perceptions of luxuriousness. Respondents' own visual stimuli (two per interview) reflecting their individual conceptions of luxury navigated the conversations. The neo-nomadic elite offered a fruitful context as it has acquired the reputation of being the vanguard of an era embedded in paradoxes. Respondents were approached face-to-face or online, using purposive sampling to achieve maximum variation. To be eligible for the study, respondents had to combine work and travel, and rely on technologies to sustain this lifestyle (Mancinelli 2020). Matching this cosmopolitan profile, 19 interviewees were included in the sample which varied in terms of gender (12 female and seven male), age (between 24 and 51 years), cultural background (Europe, North and South America, Asia, and Australia), and upbringing (mobile childhood e.g., multiple relocations, immigration experiences within

the family, and non-mobile childhood). Depending on the physical distances, interviews were conducted either virtually or in person. Inspired by the tenets of grounded theory (Glaser and Strauss 1967), we built theory by performing the iterative steps of data collection and interpretation, and using constant comparison method (Charmaz 2006).

FINDINGS

Drawing upon rich interview data on cosmopolites' luxury perceptions, we detail paradoxes that generate *complementing, relating*, and *delineating* dynamics. Our study advocates the idea that the yin-and-yang unity between dichotomous elements fuels the evolvement of luxury moments which are grouped together under the umbrella terms *revelation, reward*, and *reinforcement*, respectively. Findings evince that cosmopolites' negotiation of tensions—the conscious assimilation of the paradoxical elements encountered—is imperative for the unfolding of luxuriousness. We further ascertain that cosmopolites find themselves entangled in a web of paradoxical lifestyle conditions which discursively represent the respective luxury moments (table 1).

Cosmopolitan consumers' negotiation of a balance between paradoxical elements allows for the creation of authenticity, thereby corroborating prior findings (Gabl, Stoeckl, and Hemetsberger 2013; Rose and Wood 2005; Tumbat and Belk 2011). The navigation between these tensions is connected to eye-opening and enlightening experiences that we associate with *revealing* luxury moments. This dynamic is evocative of Belk, Ger, and Askegaard's (2003, 337) finding that consumer desire is antithetical to "socially valued qualities of reason, rationality, and self-control," and potentially nurtured by the encounter of immortality or danger. It is hence grounded in narratives about the tempting power of, for instance, the reprehensible and forbidden, which renders a mundane experience purely true. In antithesis to scholars circumscribing luxuriousness as escapes from mundanity (Hemetsberger et al. 2012; Holmqvist et al. 2020), we find that interventions of the extraordinary within the ordinary derive luxury moments that still "constitute the spice of everyday life" (von Wallpach et al. 2020, 495). Cosmopolites engage in experiences that blend paradoxical versions of reality—*"to witness [both worlds]"* (Alethea-female-31).

Table 1: Paradoxes of Postmodern Luxury Moments and Discursive Themes

Paradoxes of Postmodern Luxury Moments			
Luxury moments of…	Negotiation mechanisms	Dynamics and related characteristics	Discursive themes of a liquid/ singularized existence
…Revelation	**Authentication**	**Complementing** Juxtaposition of concurrently encountered paradoxical elements that relate to the nomad	Quest for trueness
…Reward	**Compensation**	**Relating** Juxtaposition of chronically ordered paradoxical elements that relate to the nomad	Liberation from attachment
…Reinforcement	**Differentiation**	**Delineating** Juxtaposition of concurrently encountered paradoxical elements that relate to the nomad and the outsider	Construction of otherness

Revelation

A recurring dynamic that crystallized from our analysis covers the play with concurrently encountered paradoxical elements that transform into an interwoven entity provoking luxury moments. We opt for the word *complementing* to reaffirm the potential of dichotomies that coexist and blend into a harmonious unit. The juxtaposition of seemingly contradicting elements hence enables cosmopolites to immerse themselves in paradoxical contexts. Enunciating this dynamic, one of our respondents remembers how she experienced her visit to a metropole known for its extremes. This vignette refers to the amalgamation of disjoint scenes into a holistic representation of the city's unembellished character:

"[We have] seen everything ... about what makes this New York magnificent. ... We went down on the Broadway. And there was this/ this big array of trash. ... The real New York: the trash, the smell, the glamorous, and non-glamorous. ... There was this harmony between the fantastic, the glorious, and the mundane and the dirty. ... [A] revealing moment." (Alethea-female-31)

Reward

Another prevailing dynamic from our data surrounds the idea that the juxtaposition of chronologically ordered paradoxical elements provokes luxuriousness. Pointing to what Woermann and Rokka (2015, 1490) termed "timeflow", this dynamic elucidates "the temporal interrelation (or hanging together) of meaningful," and, in our context, paradoxically opposed, "events." We draw upon the notion of relating to reinforce the finding that cosmopolites anchor their evaluation of an experience to preceding incidents as they integrate insights gained from the past into current perceptions. This resonates with Tversky and Griffin's (1991) conception of a contrasting effect where memories of a negative experience contribute to well-being. The reconciliation of paradoxical tensions is linked to consumers' negotiation of *compensation*, allowing cosmopolites to perceive luxury moments summarized under the heading *reward*. Respondents link these luxuries to dream-fulfilling or self-celebrating experiences, reminiscent of what Hemetsberger et al. (2012) associate with the luxury of becoming. We can recognize in such accounts the appeal of the "desire for a fundamental otherness" which resides in

the promise of transformation and alterity (Belk et al. 2003, 336). Since cosmopolites curate a lifestyle primarily aiming at (re-)gaining autonomy and spiritual elevation (Reichenberger 2018), findings evincing that neo-nomadic narratives of luxuriousness revolve around the subjects of freedom and inner balance (Hemetsberger et al. 2012) are intuitive. Luxury moments mark the end of a healing journey, representing the liberation from encountered limitations that arise from incisive life events or persistent imbalances, and are often illustrated by emotionally laden expressions such as enslavement (Hemetsberger, Kreuzer, and Klien 2019). The following excerpt deals with a "decelerated journey" (Husemann and Eckhardt 2019) one of our respondents made to compensate for the burden of grief which resulted in a rewarding luxury moment:

"My brother and I decided, right after [mother] passed, that we would go to the Annapurna Circuit together. ... In her honor. ... It was therapeutic for us. ... Being a digital nomad gave me the/the time to go to Nepal. ... To heal from the grief. ... It was a difficult journey, but it was very rewarding." (Zhang-female-35)

Reinforcement

Our findings further illuminate luxuriousness as derived from a nomad-related and a paradoxical outsider-related element. When juxtaposed, these elements draw a line between the me and the other, allowing cosmopolites to *delineate* themselves. Reminiscent of Tumbat and Belk's (2011) study on marketplace tensions in the context of Mount-Everest expeditions, we find that cosmopolites embrace boundaries of inclusion and exclusion. However, whereas Tumbat and Belk (2011) recognize the accentuation of differences within the mountaineering community, our data lends support to the idea that cosmopolites pursue the separation from outsiders through what Reckwitz (2017) introduces as the sub-culture's singularization. This echoes the case of pilgrimage in which individuals learn to channel their competitive spirit toward fellow wanderers (Husemann and Eckhardt 2019) and develop a communitarian sense of we (Turner 1973). As the quest for differentiation from mainstream society is a prevailing motive coining the decision to become neo-nomadic, this dynamic supports the proposition that cosmopolitan consumers incorporate the societal pursuit of constructing otherness:

THE NOMAD

RELATING = REWARD (1)

COMPENSATION

MIRROR LOGIC OF POSTMODERN LIQUEFACTION

LEGEND:

○ = Element that is Juxtaposed with the Paradoxically Opposed Element (e.g., the Glamorous versus the Dirty in New York City)

— = "Flow" of Time between the Paradoxically Opposed Elements

OUTSIDERISM

COMPLEMENTING = REVELATION (2)   DELINEATING = REINFORCEMENT (3)

AUTHENTICATION   DIFFERENTIATION

MIRROR LOGIC OF POSTMODERN SINGULARIZATION

DESCRIPTIVE INFORMATION:

moment of reward (1) =
negotiation of compensation; juxtaposition of chronically ordered paradoxical elements that relate to the nomad
moment of revelation (2) =
negotiation of authentication; juxtaposition of concurrently encountered paradoxical elements that relate to the nomad
moment of reinforcement (3) =
negotiation of differentiation; juxtaposition of concurrently encountered paradoxical elements that relate to the nomad and the outsider

Figure 1: Threefold Paradoxical Dynamics of Postmodern Luxury Moments

"We got media passes for the [Balloon Fiesta]. ... And we ended up [being treated as] VIP['s]. ... I [was] sitting next to like Discovery Channel, CNN, Huffington Post. ...Me being actually [in a balloon] like made me realize that I'm actually doing something right. ... Luxury ... was being chosen, I guess, just feeling special. ... Not a lot of people can [experience that]." (Juana-female-28)

This verbatim account illustrates how one of our respondents indulged in a luxury moment of what we associate with *reinforcement* as she negotiated a feeling of *differentiation* after having assimilated the tension between self-related and outsider-related experiences. Our analysis uncovers that encountering something that "*ninety-nine percent of people cannot do*" (Bohuslav-male-25) imbues moments with luxurious meaning. In extension to prior studies finding that luxuries convey a mystical sense of scarcity (Hemetsberger et al. 2012; von Wallpach et al. 2020), this dynamic suggests that luxuriousness draws its value from being unavailable to the outsider.

DISCUSSION

This article unravels the complexities of luxury perceptions in postmodern times (Bauman 2000; Reckwitz 2017), enquiring into how paradoxical dynamics spur experiences of self-relevant, enlightening moments that exhibit a sparse and ephemeral character. Our study replicates research on luxury as a liquid concept that crystallizes in multifaceted moments (Hemetsberger et al. 2012; Holmqvist et al. 2020; von Wallpach et al. 2020). However, in addition to earlier work in this field, we direct closer attention to the antithetical essence of luxuries by making an informed contribution to the bricolage of underlying contradictory yet mutually reinforcing elements. Culminating from our investigation are *complementing, relating*, and *delineating* paradoxical dynamics that are the luxurious moments' sources. We ultimately add to research on neo-nomadic consumption styles (Bardhi et al. 2012; Bardhi and Eckhardt 2017) by illuminating that, in a context of mobility where materials become problematic, luxuriousness reflects the postmodern consumers' quest for authenticity, personal development, and differentiation from the outsider (Eckhardt and Bardhi 2019).

In a nutshell, this study visualizes how the juxtaposition of paradoxes forms the cornerstones of luxury experiences in a context symbolizing the global appetite for a liquid and singularized existence (figure 1). Picking up the debate on liquidity (Bauman 2000), our study reveals that cosmopolites negotiate the opposing elements of the paradox in a pursuit of compensation. This melts together two consecutive contexts (liquefaction) and ultimately entails rewarding luxury moments. We further contribute to the logic of singularization (Reckwitz 2017) by advocating that cosmopolites hunt for the authentic (inner-directed singularization) and the different (outer-directed singularization). They negotiate both sides of the paradox-coin, which gives rise to *revealing* and *reinforcing* luxury moments, respectively.

This study is inherent with limitations, being interpretive in nature and confined to consumers who have already transitioned into the globetrotting lifeworld. As an avenue for future research, we encourage the adoption of a longitudinal study to assess developments over an extended time frame and see promise in conducting a visual-based analysis to capture the breadth of the subject matter. We hope to stimulate dialogue on the hitherto underexplored topic of luxury moments in neo-nomadic times and therefore point out the importance of scrutinizing the tensions forming the foundation of their constitution. Because, indeed, the bumps in the road of a postmodern journey appear smoothed out when considering the multiplicity of luxuries that potentially arise therefrom—right?

Signs of Sustainable Challenges in Intimate Habits

Lívia Lessa de A. Silva, Federal University of Rio de Janeiro, Brazil
Leticia M. Casotti, Federal University of Rio de Janeiro, Brazil
Catia Silva da C. Moreira, Federal University of Rio de Janeiro, Brazil

INTRODUCTION

This study aims to understand meanings and practices associated with intimate habits that can represent challenges for more sustainable consumption. Our context is showering routines and we observed issues related to water consumption and consumption of hygiene products. Our daily routines, such as taking a shower, are still obscured (Wals, 2019). It is a long way to uncovering what makes our unsustainable routines practices and how to engage in new responsible and sustainable ones. Showering is our context, a strong habit because of its frequency and repetition, its private and intimate character, its objects, meanings and doings embodied in its practice (Wilhite, 2012; Magaudda, 2011).

We locate different political views on sustainable initiatives. One of them believes that behavior change depends fundamentally on the will and capability of individual action, another view advocates a structural change in society. Public policies have shown the protagonism of individual choice, i.e., they seek to inform in order to enable people to rationally choose better options (Fung, Graham & Weil, 2007). Nevertheless, recent studies show that structure and socio-material context overlap with cognitive aspects (Hargreaves, 2011; Shove 2010, 2013). When people consume resources like water, electricity or gas, they are actually consuming services and experiences in a cultural context provided by these resources. We follow the belief that for more effective sustainability initiatives it is important and necessary to understand meanings and practices that build habits (Shove, 2003; Shove & White, 2011; Wilhite, 2012).

Tadajewski (2019) attributes to marketing the creation and destabilization of habits and advocates the importance of the discipline to focus on the formation, maintenance, and change of consumer habits. White, Habib and Hardisty (2019) made an academic literature review from marketing and behavioral sciences focus on how consumer behaviors can be more sustainable. They propose a guiding framework based on psychological factors and they discuss shift factors to sustainable consumer behavior. However, they underestimated the cultural perspective contribution that guided our research. We highlight the inspirational work of Elizabeth Shove and colleagues using the lens of Practice Theory (Shove & Wilhite, 1999; Shove, 2003; Shove, 2007; Shove, Trentmann & Wilk, 2009; Shove, 2012; Shove, Pantzar & Watson, 2012).

We contribute to consumption studies bringing data from intimate practices of material, sensory, hedonic interactions of a ritualistic and daily experience. Different from the predominantly cognitive approach, this exploratory work brings an intimate and holistic view of the mundane showering ritual. Researchers should engage with lived experience to make the individualized experience more real and connected with the historical, material, social, and cultural forces. As our interviewees narrate, taking a shower is a daily, intimate journey rather than a functional hygiene practice. The showering experience reveals multiple social and material interactions that involve time and space.

We found similarities with Shove's (2003) description of practices that go "behind the bathroom door". Shove's work brings a historical perspective to show how cultural practices evolved to unsustainable consumption patterns. We go further connecting showering intimacy with sustainable challenges and possibilities of material-social-political interventions, such as the use of transformative learning theory (James, 2019; Pisters, Vihinen & Figueiredo, 2020), a pedagogical proposal that considers mundane experiences as part of social and cultural life, rather than as individual and autonomous practices.

METHOD

This qualitative study followed an interpretive approach (Arnould & Thompson, 2005; Strauss & Corbin, 2008) using two types of data collection: bathroom observations that gave rise to field notes and photographs (Cresswell, 2013) and in-depth narrative interviews, seeking a deeper understanding of the topic (Belk, Fischer & Kozinets, 2013).

We conducted ten narrative interviews to understand signs of sustainable challenges in intimate habits. We investigated the experience of showering with the elements that are part of this daily habit and the meanings associated with this experience. The interviews followed a semi-structured script and were recorded and transcribed with the prior authorization of the interviewees, totaling about 11 hours of recording and 132 pages of transcription. We decided to interview, in the first part of the research project, urban women, educated, young (up to 30 years old), residents of the state of Rio de Janeiro from the upper-middle class.

We asked the interviewed women to visit the bathrooms where they used to take a shower. Once inside these places, other questions were asked regarding the space, the products present there, the practices related to their use, the moment of showering, etc. In the end, we asked for permission to take some photos of the environment in order to illustrate the conversation and to be later analyzed.

The analysis of the interviews was done through the open coding method, which consists in identifying phenomena and building concepts and categories through a thorough examination of the data (Strauss & Corbin, 2008). After the process of separation into distinct parts, we made comparisons, searched for similarities and differences between the data collected, as proposed by Strauss and Corbin (2008), and only then emerged the categories of analysis.

MAIN FINDINGS

Conflicts and sustainability in showering experience

The open questioning about the meanings of water has brought some concerns about sustainability and water's future as a natural resource. However, when interviewees reported the experience of showering, sustainable issues dissolve amidst scenarios, emotions, materialities, and possibilities of living the showering experience.

The testimonies show some discomfort with the excessive consumption of water in the shower, with chemical components of the products or with difficulties in access to sustainable products. Marcela (25) signals that she wants to start a movement of change in consumption: "I would like to", "I have been looking", but refers to the "environmental issue" as "hypocrisy". She reveals that the first motivation to consume more ecological products is "the health of body, hair, skin" and that the "health of the planet and the environment" is only a consequence.

Some interviewees revealed conflicts regarding the waste of water when in long and relaxing experiences of showering. To balance this conflict, they justify themselves by making comparisons

with industry and compensatory mental calculations. Monica (25) and Amanda (21) recall that the amount of water wasted by industries is much greater and that it would not be consistent to consider showering water as a villain. Amanda (21), who is a vegetarian, explains her considerations:

"I've studied and I know that most of the waste of water is in industry. If I take a shower for 15 or 20 minutes, it won't make any difference. If I stop eating a pound of meat it will make a lot more difference than two months of showering."

Talita (24) recounts her recent "attempt" to spend less water and already presents her doubts about the continuity of the new practice.

"Usually, I shaved inside the shower and yesterday, for the first time, I said 'I'm not going to do that inside the shower, I'm going to do it outside so as not to stay in the shower too long'. I don't know if it's something I'll keep doing, but it's an attempt to spend less water."

Showering is a daily, ritualistic and intimate experience. The movement of change is not easy because it also requires understanding external forces that participate in the construction of the experience and present factors that can be confronted and modified (Wacquant, 2007; Sahakian & Wilhite, 2014). As one interviewee reported, "showering is a journey". We found curious motivations, descriptions, and interpretations about this trip that will be synthesized below and that were separated into three types of showering: routine, beauty care and hedonic.

Taking a routine shower

Consumption studies analyze several automated and routine daily practices such as bathing (Phipps & Ozanne, 2017; Wilhite, 2012; Shove, 2012). Some meanings of these practices are assumed, while others are in a "bubble of inattention" (Phipps & Ozanne, 2017), what explains why the first functionality of taking a shower, body hygiene, appears discreetly in the reports. Cleaning is such a basic function that it doesn't even need to be remembered.

The stages of this daily shower are described by Natália (26) as an "automatic" "process", "without thinking", something that compares to putting the cell phone in "airplane mode". This "process" is described as embedded security by Phipps and Ozanne (2017), because it is a routine and we do not think about it. Daily incorporated activities bring security, predictability, and serenity. Talita (24), on the other hand, speaks of the daily showering as faster, a "cycle" to be accomplished, an "obligation", a "need" before formal commitments. She differentiates the morning shower from the night shower, which is more relaxing and longer-lasting and will be explored further on.

Taking a beauty shower

This type of showering involves several aesthetic practices, is deliberate, and therefore has a longer duration, occurring on specific days. It includes practices aimed at self-care, cares for "the other" or cares for special occasions where they meet "others". In this type of showering, beauty products proliferate for rituals of aesthetic transformation that seek a "right appearance" suited to social expectations (Rook, 2007).

Taking a beauty showering differs from the habit since it is not characterized by the automatism of realization (Wilhite, 2012). Laís describes its product planning, time, periodicity and spaces involved, for example, inside or outside the bathroom or shower, with or without the use of the sink. The spaces, products and time are related to the different aesthetic care inserted in the showering experience that can involve the use of masks on hair and face, exfoliating, hair removal, and hair discoloration.

"I plan what I'm going to use, if I'm going to stay until the end (in the shower) or if I'm going to wash my head in the laundry sink because I'm too lazy to wait for the hair mask to take effect [...] I plan what I'm going to use in the day if it's going to be faster or not. [...] This one is like the monthly shower, but it usually occurs on Thursdays, which is the day of discoloring hair, exfoliating, using everything I have in my bathroom."(Laís, 25)

Showering as an aesthetic care can be seen as a beauty ritual and includes processes and products that are not common to routine. Beauty showering involves "more attention" than routine showering. As Bruna (25) explains: "When I meet someone [...] the motivation to take a shower is to feel better with my body and my image".

Shove (2003) describes bathing in Europe as an experience that remains private and without technological advances, what differs from the diversity of products photographed that are part of the action described as an experience also "for the other".

Taking a hedonic shower

For some interviewees, the most striking feature of the showering experience is pleasure. The bathroom is highlighted as the space where they can "relax", "slow down", "do nothing" or take a break from their daily routine. As Amanda (21) explains: "When showering you can't do two things at the same time, so it's the moment to stop and just take a shower, a time for me, to slow down".

Showering is a source of relaxation and energizing and joy. For Talita (24), the night shower is a "relaxing ritual", while for Beatriz (26) the pleasure is "the sensation of water in the body" when she is upset, what gives her "energy". Showering is also reported as a turning point related to depressive states. When Yasmin (25) feels sad and does not want to leave home, she does not take showers. The denial of showering seems to be a metonymy: denying the shower is like denying life. She says that in these moments she doesn't want to look at or feel herself. She explains how taking a shower represents getting out of the "depressive feeling":

"The turning point is taking a shower, the turning moment to go to life and say to myself 'wake up, you have to get out of the house and do what you have to do, you're alive'. It never happens that I take a shower and keep the same depressing feeling."

FINAL COMMENTS

In the small space of the bathroom, we found intimate and insightful experiences that delineate sustainable challenges more broadly, going beyond those focused on individual decision making. The observations and narratives show the political-social-material possibilities of interventions to promote sustainable consumption practices. The main findings are summarized in table 1.

In the routine showering, speed and a "bubble of inattention" (Phips & Ozzane, 2017) predominate. The main specific challenge in this type of shower is to break the automatism of behavior (or taking advantage of it). Our research indicates that public policies could pursue the reconfiguration of socio-material environment, e.g., regulating the dimensioning of water flows, encouraging morning showers, stimulating new market technologies to become possible. These policies may include measuring water consumption during the shower and/or per room, having devices alerting about time spent in the shower, and developing products which are easy to rinse. Other

Table 1: Showering experiences: sustainability and possibilities

	Main Findings	*Sustainable challenges*	*Political-Social-Material Possibilities*
Taking a routine shower	• Daily habit • Automatization • Short duration • Focus on functional aspects • Basic hygiene products	• Change the automatism • Show individual impacts • Connect individual impacts with collective issues and future consequences • Encourage morning routine of this showering type	• New technologies to indicate showering water consumption (time warnings and water bill divided by rooms or taps consumption) • Public policies to encourage morning showers • Regulations on water flow sizing • Encourage products innovation that are easy to apply and rinse • Transformative learning to increase consumer awareness about its own practices' impacts • Transformative learning to connect the notion of self to the collective and the planet
Taking a beauty shower	• Planned/deliberated ritual • Less frequent • Rituals of appearance care • Plenty of products • Plenty of processes • Hair care influences other types of care • Long duration • Search for aesthetic results • Aesthetic self-care for others	• Shorten the duration • Use sustainable products • Shorten the necessity of water in beauty processes • Question imposed beauty standards • Connect individual impacts with collective issues and future consequences	• Create beauty processes that prevent water waste or do not require water • More innovation offers of sustainable products • Hair products deserve special attention because they influence the consumption of other items • Transformative learning to question and raise consumers awareness of cultural standards of beauty • Transformative learning to increase consumers awareness of their own practices' impacts • Transformative learning to connect the notion of self to collective and planet
Taking a hedonic shower	• Ritual of pleasure and reenergization • Sensorial and affective • Long duration • Plenty of products • Self care • Represents a break in the everyday rush	• Encourage other ways of reenergization • Shorten the duration • Question justifications and compensatory calculations used • Strengthen identity of concern for the environment • Connect individual impacts with collective issues and future consequences	• Taxes on excessive water consumption • Encourage other reenergization practices • Public communication initiatives on social networks to raise awareness of sustainable issues • Transformative learning to increase consumers awareness of their own practices' impacts • Transformative learning to connect the notion of self to collective and planet

market offerings could help to simplify the showering process, like products that accumulate several purposes in common, such as those proper to wash both hair and body.

The beauty shower ritual is planned, full of products and processes, long but less frequent. This private ritual is searching for results to please a social audience. The hair seems to have a special meaning dominating the planning processes and influencing the use of other beauty products. Hair care seems to be more connected with sensualization aesthetics. How to shorten the showering duration to avoid waste of water and break imposed beauty standards? New technologies, public policy incentive and regulation can support the transformation of these ritual characteristics into more sustainable ones.

Hedonic showering rituals are also deliberated and have a long duration, but this type is less planned than the beauty shower. It seems to be related to more sensorial and affective aspects, in the search of pleasure and reenergizing. Our findings can be connected with some aspects of Bargh and Shalev's (2012) study which highlighted that showering can be part of emotion regulation and can also compensate the lack of social intimacy. Those characteristics can be the greatest challenge to transform this experience. We can point strategies to reach more sustainable practices: to incentive other ways of pleasure and reenergization, to create justifications and compensations to stimulate shorter duration baths and to promote connections with collective causes and the future scenario of planet unsustainability. Interventions should be creative in the use of social media to promote other forms of routine pleasures and pauses. The encouragement of meditation, with practice in schools and companies, could bring benefits in this regard.

We found that, despite the type of intimate habit, to evolve towards more sustainable practices it is necessary a symbolic reframing because it is hard to change behavior with only information interventions. Besides this symbolic reframing being part of public and private discourses, we believe that transformative education (Pisters, Vihinen & Figueiredo, 2019; James, 2020) can play a role in this. Transformative education seeks to bring to consumers the awareness of the automated aspects influenced by sociocultural structures. Broadening awareness of the interrelationship of self, society, and planet can make consumers reflect on the impacts of their day-to-day practices. The main points to be addressed through transformative education are: turning individual impacts more tangible, showing the implications of the individual practice on the collective sphere, breaking rationales and compensatory calculations of unsustainable practices and stimulating public commitments to change.

Fix, make, burn or blow things up! How Makerspaces Foster Consumer Empowerment

Caitlin Elizabeth Simard, Federal University of Rio de Janeiro, Brazil
Maribel Carvalho Suarez, Federal University of Rio de Janeiro, Brazil

INTRODUCTION

Makerspaces are collaborative places for tinkering, creating, experimenting, and sharing knowledge and experiences using various tools and technologies (Halbinger, 2018). They provide access to a range of equipment and machines for personal making (Smith et al. 2016), that allow people to make things, from the beginning idea to final production (Fleischmann et al. 2016). Makerspaces blur the lines between crafts and technology (Posch 2017) and are seen by some as an iteration of the DIY culture (Papavlasopoulou, et al. 2016).

Makerspaces have been studied for potentializing entrepreneurship, innovation, diffusion, and local economic development that can contribute to the public good (van Holm 2015). They provide access to and lower the costs of those factors known to support innovation (Halbinger 2018) and diffusion (de Jong et al. 2015). Despite this relevance, however, little is known about repercussions to and influences on consumers practices.

Prosumption is an emerging practice in which consumers become producers and make some of their own products (Ritzer et al. 2012). The present research investigates how participation in Makerspaces has the potential to transform consumers' relationships with products and consumption. More specifically, this research aims to understand how Makerspaces foster consumer empowerment.

PROSUMPTION AND EMPOWERMENT

Wolf and McQuitty (2011) refer to the empowering potential of prosumption at an individual level via DIY activities. Hunter and Garnefeld (2008) view consumer empowerment as a positive subjective state which results from a mental comparison of a consumer's abilities relative to existing or previous abilitie. In a diferent direction, Cova and Cova (2012) discuss prosumption empowerment as a marketing discourse engendring governmentality (Foucault 1978) of consumers. Presenting prosumers as autonomous and competent co-producers, this discourse contributes to moulding consumers to the neo-liberal project, inflating the role of consumption instead of using the more prevalent non-consumption related competencies.

Holt (2002) suggests a alternative approach, presenting consumer empowerment as seeking out social spaces that make it possible to produce a culture that is different from that forced upon consumers by the market. In turn, these spaces allow consumers to constantly reconfigure their identities, as opposed to letting the market dictate identity for them (Holt 2002). Denegri-Knott et al. (2006) view consumers as empowered when they can manipulate and even produce special spaces within the existing market in which they can construct their cultural (consumer) identity. The authors (2006, p.964) argue that "a *truly powerful consumer would be a **maker**, and not adapter of spaces and goods"*.

This is a key insight into how Makerspaces could contribute to empowering consumers by enabling and infact encouraging them to engage in physically making goods. Another differentiating element of Makerspaces is the person to person interaction between consumers. Denegri-Knott, et al. (2006) have found that consumer power becomes amplified when consumers combine their resources and skills with those of other sovereign agents. In this sense, Makerspaces can potentialize consumer empowerment through collective prosumption and resource sharing.

The present research on Makerspaces contributes to what has been studied in terms of consumer empowerment via prosumption in two primary ways. The first way is studying prosumption in a collective space as contrasted to the preponderance of prosumption research which has been studied on an individual level through DIY activities (Wolf and McQuitty 2011) and craft consumption (Campbell 2005). The second contribution is by studying prosumption in a physical environment, rather than the commonly research of prosumption research which has been studied in digital communities (Tian et al. 2017).

METHOD

This research investigates two case studies: HacDC and Arlington Central Library. These studies were chosen using theoretical sampling (Eisenhardt 1989) and convenience criteria. The two cases were selected because they represent polar types, which can be helpful to make the process of interest "transparently observable" (Eisenhardt 1989). Both the HacDC and Arlington Central Library research studies fall under the maker umbrella, and have many commonalities, but they also have many distinctions.

HacDC is classified as a Hackerspace (van Holm, 2015), which means that participants make some physical artifacts as in other Makerspaces, but the focus of the projects is more on technology and software, rather than hardware. HacDC was founded in 2008 by a diverse group of engineers, artists, and hobbyists. It is the second oldest hackerspace in the United States. There is a $60 monthly membership fee with approximately 50 members. There are monthly meetings in which members decide upon programming and other issues pertinent to the Hackerspace. HacDC is a nonprofit organization and has a board of directors that is run by volunteer members, thus presenting an anarchistic, countercultural environment and ethos.

Arlington Central Library is classified as a makerspace in the general sense of the term, or a space where people gather to make things with tools and materials (Smith et al. 2016). This Maker program run by paid government workers, employs low to mid-level tech, and has a very open, collaborative, calm environment, with no explicit political undertones. It started in 2015, when librarians identified that Makerspaces were trending at other libraries and they decided to ask the Library board for funding for Maker events. The Library is located in the Arlington neighborhood of Virginia, which is relatively affluent and well developed.

The data for this study were collected using two primary research methods both field observation (Emerson 1995) and interviews (Spradley 1979). Field observations took place from June 2018 – September 2018. The first author attended a variety of events and programming at the two sites over this period, observed the physical space, governance, structure, participants, and culture. Six participants were interviewed, providing a mixture of both organizers and participants, to gain more diverse perspectives. Informants profile is presented on Table 1.

Analytical procedures followed the part-whole process of hermeneutic analysis (Thompson, 1997), including open coding and analytical memos (Saldaña 2015). The idea behind these procedures is to compare and contrast interviews, observations and cases, developing categories and concepts. Rather than being linear, this process evolved in several rounds of coding and frequent references to the literature as specific themes emerged.

Table 1: Profile of Interviewees

Pseudonym	Case	Age	Years at Markespace	Affiliation
Stacy	Arlington Central Library	30	1.5	Adult Maker Librarian
Dawn	Arlington Central Library	56	3.5	Teen Maker Librarian
Maria	Arlington Central Library	29	3	Library Associate
Frederick	HacDC	58	10	Member
Dave	HacDC	38	3	Member
Mike	Arlington Central Library	39	4	Volunteer

RESULTS

HacDC and Arlington Central Library gather consumers in the same place and give them the tools including physical, social, cognitive, experiential and emotional ones, to make their own things. Observation and interviews suggest that the Makerspaces foster environments ripe for stimulating consumer empowerment. The stimulation of consumer empowerment ultimately happens through consumers being exposed to new contexts with materials, through human-thing interaction and learning how to prosume in a collaborative environment. Both HacDC and Arlington are places where consumers can combine their efforts and resources to make and fix their own products, and in this way their consumption interests can counter traditional capitalistic models. This idea is similar to that of Denegri-Knott et al. (2006), who suggested that consumers often combine resources to feel empowered in the face of mainstream producers.

Building upon the concept of prosumption in physical settings, we extend Hunter and Garnefeld's definition of consumer empowerment as it occurs in Makerspaces to "prosumer empowerment". This extension is well situated, as the father of the Maker Movement, Dale Dougherty, believes the Movement has come about at least in part due to people's desire to engage with artifacts in ways that make them more than consumers (2012). In the case of Makerspaces, it is in a way that makes them prosumers. This definition is extended, as our exploration goes beyond the subjective, individual, psychological aspect of consumer empowerment to explore empowerment as a collective experience in collaborative environment where consumers are empowered to become prosumers, through the interaction among human and non-humans actors.

Our research evidences that not only humans but tools are central to Makerspaces and the prosumer empowerment process. First, because consumers have access to tools they would not have oterhwise have had access to in their own homes. For example, very few consumers have 3D printers, laser cutters, or soldering irons to make their own goods, but these are available for use at Makerspaces.

Second, we suggest that empowerment emerges in the iterative process occurring between humans and things intentions. Participating on Makerspaces consumers present different intentions related to each specific prosumption practices, such as:(1) Fix/repair; (2) Create/invent new things; 3) Hack/modify a finished product to adapt to an unintended function. Non-human objects, in the same way, carry their own intentions. Based on Bulow (1986), we highlight two intentions that pose a challenge to the consumers on Makerspaces: 1) Built-in obsolescence which relates to the conception, design, and production of a commodity with an intent of it being useful, functional or popular for a certain period of time, after which it becomes unfashionable or no longer functional and 2) non-repairable, which occurs when a product is designed with an intent to only be repairable by the manufacturer or not at all.

Our analysis suggests that as consumers interact with objects and their own intentions, either by having them fulfilled or seeing them disrupted by the design intention of things, they can become empowered to prosume. An example of this occurs when a consumer with a certain action intention effectively carries out this action. This empowerment happens through a sense of self-fulfillment and accomplishment, and ultimately the human fulfilling the action intention. The consumer breaks the design intention of the object and ultimately grants a new application to the object or returns the object to its original application or function.

However, we also observed consumers who came into the Makerspaces intending to fix or repair an object but who were ultimately unable to do so. In this sense, their action intention was disrupted, and their sense of agency was stimulated. The resulting frustration and realization that not everything is repairable reveals the commercial forces that shape consumption to some extent and serves to empower consumers by giving them the opportunity to rethink their consumption of and relationship with things. In this sense, we suggest that this activation can also lead the consumer to think critically and evaluate their current consumption.

This concept of disrupting or 'breaking' the action intention of the consumer is illustrated by Mike, a volunteer in Arlington. He considers himself a professional Maker, meaning he is a handyman, an artist, a designer, among other skills or talents. He explains that in the case of technology, the intention of the thing is not to be repairable by consumers. Contact with this reality can transform consumers:

I think it's good for people to engage in, especially when you think in terms of what you're doing when you buy a new thing that's like that, maybe the next time you buy a new thing, you say hey 'is this going to last, is this really worth buying? Do we want to turn the resources of the planet into this thing that's ultimately gonna be a piece of trash?

In this case, the action intention of the consumer, which is to fix a technological artifact, resulted in a disruption to fulfilling the desired outcome of being able to fix it. Following Haggard & Tsakiris' (2009) concept, this could result in the consumer having a greater sense of control over the consequences of his choices and therefore, over this or her own consumption. Latour (2008) frames this discussion in terms of 'reopening' artifacts, suggesting that people are increasingly recognizing the "designed" rather than "discovered" quality of artefacts, a realization that reopens them. In this sense, the interaction between humans and things in an intentional manner allows consumers to see materials in a different light, demonstrating to them the "poor" design of some products and giving them the tools to restore the original affordances. The actual act of using the materials to restore affordances can empower consumers to build the world they want to see. Consumers in Makerspaces have the poten-

Table 2: Summarizing the results

Makerspace Collective Practice	Consumers Intentions x Design Intentions	Empowerment Process
Fixing/Repairing	Restoring the original affordances of objects, originaly built to obsolescence and to be non-repairable	**Favourable outcome** - consumers would break the design intention of the object and ultimately grant a new affordance to the object or return the object to it original affordance, engendering confidence. **Unfavourable outcome** – consumers frustration reveals the commercial forces that shape consumption, engendering reflexivity.
Inventing/Creating	Producing something brand new from raw materials	Creat new offers and new ways to fullfill existing needs, engendering criativity.
Hacking/Modifying	Changing the affordance of objects	Subverting existing logics, consumers can create cheaper, long lasting and more efficient products, engendering transformative and sustainable utopias.

tial for seeing matters of fact as matters of concern. This consumer empowerment can happen individually, when a consumer realizes that an object can not be fix/repaired, as well as in a group, when a consumer witnesses this situation happening with another consumer. This latter situation constitutes collective consumer empowerment.

Inventing and creating practices have a similar outcome intention which is to produce something completely new from raw materials. This is distinct from repairing, which is returning things to original purposes (Jarzabkowski et al. 2013). Inventing has a scientific, commercial connotation, while creating has an artistic, exploratory connotation. One interesting example was presented by members of HacDC who invented a circuit board system to showcase at the DC Maker Faire in June 2018. This was a collective effort that involved a creative process and many materials. The product which was for desoldering circuit boards, potentially could have been brought to the market for $3,000, but instead the hackers pooled their knowledge and energy and created one for $60. The functionality of this invention was to desolder circuit boards into their respective parts once the circuit board was no longer functional or if some of the parts were needed or useful for another project. This is another example of collective consumer empowerment through pooling resources and knowledge.

Finally, hacking or modifying is distinct from the other two action intentions explored, specifically, fixing and inventing, as it seeks to explicitly change the function and reason for various objects creation and intended use. Hacking is also a creative process, embedded in the hacker ethic of problem-solving (Erickson 2008) as well as producing novel artifacts (Söderberg 2007). At HacDC, Frederick feels particularly excited with the experiences in which they blow things up, experimenting to learn how the product works:

I found this amazing book on analog electronics that says, 'Burn things out, blow things up' and that's how you learn, by experimenting. Let's slice this open with a box cutter and see if we can keep it working while its being cut open.

This is a prime example of improving purposes and applications and "disrupting" the design intentions embedded in objects. It also speaks to how hackers view the interaction with materials, which is "we can take it apart and make it work even better than now". This prevalent attitude on Makerspaces leads to consumer empowerment and agency because members are in a space where it is expected that you not only fix things, but also improve them. In this sense, members literally "fix" a problem, something that isn't working or something that could work better. In this sense, they can see beyond the implicit intentions for the objects. This innovative ethos also af-

fects other practices, for instance, the way consumers perceive and manage their trash. Dawn, a Maker Librarian at Arlington, explains how she started to see treasures in trash once she began the Maker program:

"Once you get your mind that way, it's hard to walk by a so-called pile of "trash" and not like look at it again and think 'Can I do something with this?' and that's what I do all the time".

Our analysis of Makerspaces relates sociomateriality to consumer empowerment, by studying consumers' activated sense of agency when they interact with materials. Depicting the iterative process connecting and challenging humans and things intentions, the research explains how the prosumer empowerment process can lead not only to users more readily recognizing the affordances of different objects, but also how to effectively gain the practical skills to act upon this knowledge by making some of their own goods and learning how to fix others, thereby defying design intentions and the mainstream marketplace.

Consumer Waste Meaning(s): A Semiotic Perspective

Cristiano Smaniotto, Aarhus University, Denmark
Jean-Paul Peronard, Aarhus University, Denmark
Anne Gammelgaard Ballantyne, Aarhus University, Denmark

INTRODUCTION

Environmental changes have raised concern about the deteriorating effects that current consumption modes have on the wellbeing of the entire planet (World Economic Forum 2009a, 2009b, 2010). Consequently, there is a growing research concern for sustainable consumer behavior (e.g. Gabriel and Lang 2008; Giesler and Veresiu 2014; Mick et al. 2012). Whereas existing consumer research has primarily been occupied with issues of (sustainable) acquisition and consumption (Antonides 2017), there has been less interest in issues of disposal behavior (Benton 2015; de Coverly et al. 2008). This is unfortunate, as consumer disposal plays a major role in establishing a sustainable future (Brosius, Fernandez, and Cherrier 2013). Therefore, the aim of this study is to enhance our understanding of consumer disposal by analyzing the symbolic relation between consumers and their discards.

Existing research focuses on disposal through two main perspectives: a decision-making perspective, investigating consumer choices leading up to waste production (e.g. Kidwell, Farmer, and Hardesty 2013; Roper and Parker 2008; Trudel, Argo, and Meng 2016); and an exchange perspective, investigating the practices through which consumers try to avoid waste by circulating valuable items (e.g. Brosius et al. 2013; Eden 2017; Lastovicka and Fernandez 2005). While both these lines of inquiry advance existing knowledge of consumer disposal, they unwillingly dichotomize consumer discards as either valueless (the decision-making perspective) or still-valuable (the exchange perspective). This dichotomization is dangerous because it implies a simplification for which discarded objects fit the either/or categories of valueless and valuable. However, studies show that consumers' categorization of the value of unused objects is not so straightforward (Cherrier and Ponnor 2010; Hirschman, Ruvio, and Belk 2012). To solve this issue, this paper offers a framework capturing the ambiguity of the relation between value and consumer waste, that is, between value and the objects that consumers discard. As value is a specific type of meaning (Miller 2008), our question is: what meanings do consumers attribute to waste? Put differently: how do consumers interpret waste?

To answer this question we draw upon semiotics, a theoretical approach especially suited when studying consumer interpretations of contrasting meanings (Floch 1988; Mick and Oswald 2006). The main contribution of our study is a semiotic square (Greimas 1983) that synthetizes consumers' multiple and often contrasting interpretations of their discards. We apply the semiotic square to focus groups interview data which allow us to contextualize, adjust and refine our model. In the discussion, we highlight the contribution of the proposed framework for existing research in consumer disposal. Overall, our model captures the dynamicity of consumer waste interpretations and offers a tool for future research to elaborate on changes in these interpretations.

CONCEPTUAL FRAMEWORK: WASTE IN CONSUMER RESEARCH

In this section we analyze how previous consumer research has investigated the relation between consumers and their discards. We identify two predominant approaches: the decision-making and the exchange approach. The basic distinction between these two approaches is the relation between waste and value they put forth. By comparing them, the aim is to identify what (does not) constitute waste in consumer research.

The decision-making approach predominantly analyzed consumer waste as garbage, i.e. discarded products which are considered valueless because at the end of their lifecycle. Here, waste becomes a problem of deciding where and how to dispose of a product. Studies of this kind produced indeed valuable insights on how attitudes (Roper and Parker 2008), motivations (Fernandez, Brittain, and Bennett 2011; Green, Mandhachitara, and Smith 2001; Trudel et al. 2016), lifestyle values (Aschemann-Witzel et al. 2018), political ideology (Kidwell et al. 2013) and product perception (Trudel and Argo 2013) influence consumer choices about product disposal. What is important to notice here is the opposition between waste and value put forth by these studies. Put differently, consumer waste is that which is not valuable (for consumers).

The second approach expands the analysis of disposal to the circulation of value happening through discard exchanges. These studies focus on a range of exchange practices, such as reselling (Lastovicka and Fernandez 2005; Philip, Ozanne, and Ballantine 2015; Ritch 2019), freecycling (Eden 2017), gifting (Roster 2014), passing on (Curasi, Price, and Arnould 2004; Price, Arnould, and Curasi 2000) and curbside dumping (Brosius et al. 2013; Guillard and Roux 2014; Roux, Guillard, and Blanchet 2018), through which consumers attempt to control the transfer of discarded objects that are still perceived as valuable (see also Türe 2014). Few studies also looked at how alternative practices of food waste recovery and distribution are normalized and, thus, the value of food waste reassessed (Gollnhofer 2017a; Gollnhofer 2017b; Gollnhofer, Weijo, and Schouten 2019). Therefore, this approach challenges the linear opposition of waste versus value discussed above, since from an exchange perspective discards may well be valuable.

Drawing on both approaches, we suggest that waste is both valueless and valuable. In other words, waste for consumers is not a fixed category of what is ultimately rejected because valueless, nor consumer always consider their discards for the potential value they may unleash trough exchange and circulation. More accurately, consumers attribute multiple and even contrasting meanings to waste, which reflect the different ways in which they interpret and engage with their discards.

METHODOLOGY

This study draws upon semiotics as a methodological entry point, because of the aim of exploring consumer interpretations of contrasting meanings (Floch 1988; Mick and Oswald 2006). To this end, we apply the theoretical notions developed by Greimas (1983) to develop a typology for conceptualizing consumers' meanings associated with waste. The developed typology is based on a review of extant literature in consumer waste and a deep reading of conceptualizations of waste in the social sciences. Key points from the literature are coupled with Greimas' (1983) semiotic square. The outcome is a typology of consumer waste meanings that is further contextualized by the empirical data of the study, which is based on the focus group methodology.

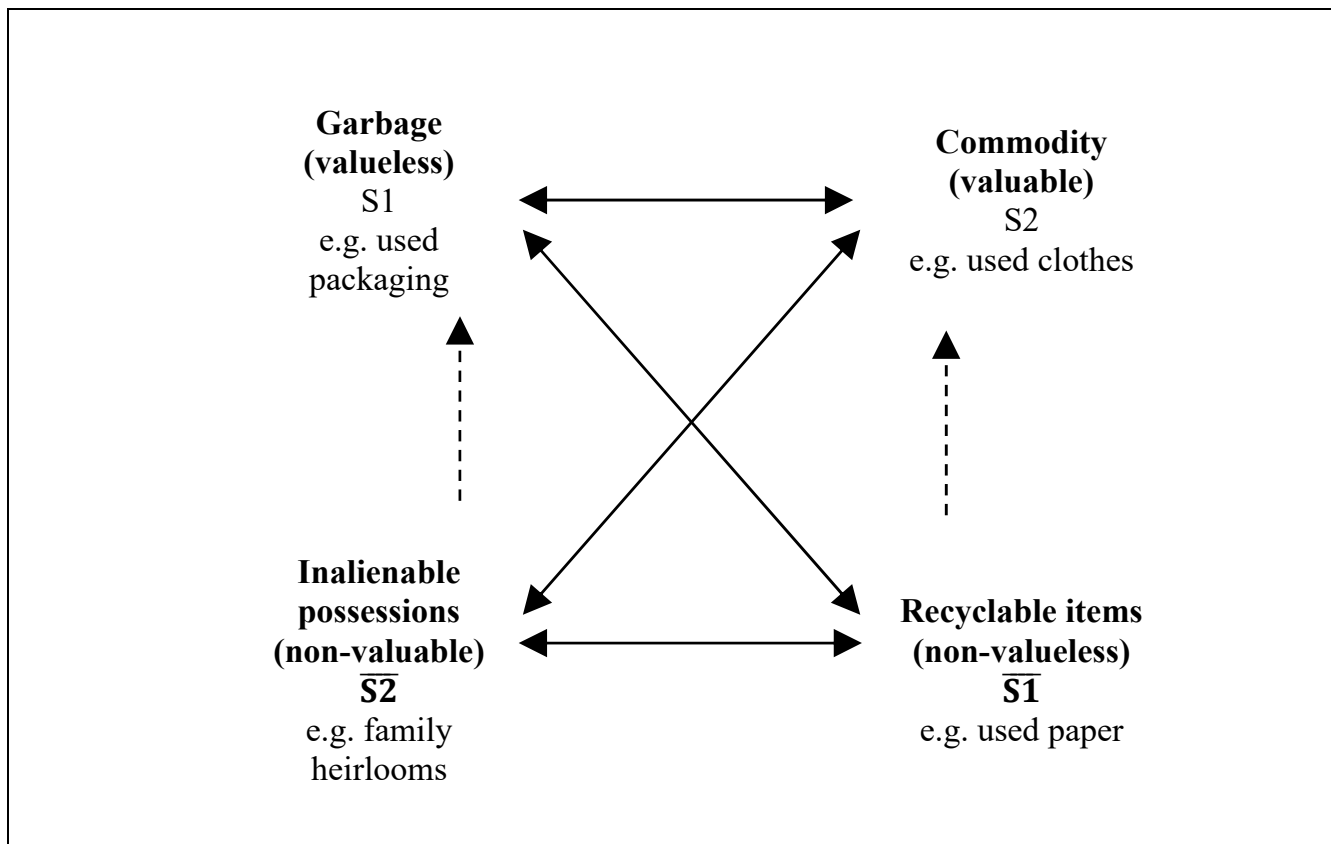
Focus group interviews is a recognized method to explore how meanings evolve in a social setting (Krueger 1998; Morgan 2010). We conducted 6 focus group interviews with university students.


Figure 1 - A semiotic square of consumer waste meaning(s)

Each focus group interview consisted of 6-10 participants, with a total of 48 participants. We aimed for a heterogenous composition of groups to ensure a broader variation of opinions, experiences and meanings. Thus, each group consisted of a mix of men and women with different cultural backgrounds. The interviews were semi-structured and the participants were asked to debate their experiences with various types of disposal options. The main interview themes were (1) what is waste, (2) attitudes towards waste, and (3) rationales for disposal. The focus group discussions were audio recorded and transcribed verbatim with informed consent from the participants.

We analyzed the transcripts through a thematic analysis. According to Braun and Clarke (2006) the "thematic analysis is a method for identifying, analyzing, and reporting patterns (themes) within data" (6). A theme should capture important aspects of the research topic in the data. Hence, a thematic analysis may be done taking the point of departure in a theoretical interest in a given topic (Braun and Clarke 2006) In this study, the interview transcripts were thematically coded focusing on waste by utilizing Greimas' (1983) semiotic approach. More specifically, we applied the four units of meaning of the semiotic square as the theoretical backdrop for generating themes from the data (summarized in Table 1).

FINDINGS: A SEMIOTIC APPROACH TO CONSUMER WASTE

Based on structural semantics, Greimas (1983) created a method to analyze the meaning of concepts. A basic premise of this method is that meaning is created through differences (i.e. binary oppositions) among signs as they are used and interpreted by individuals. Greimas incorporated these oppositions into the semiotic square. There are two types of oppositions (S1, S2) at work in the semiotic square: the first is contrariety, which are semantic units of meaning

that are equally informative for the category in focus as well as opposite systems of meaning. The second is contradiction, which are relations formed on negation in terms of absence of some information or quality.

The relation of contrariety (S1, S2) is based on the characterization of waste as valueless versus valuable made by existing consumer research. Thus, on one hand, waste can be conceptualized as valueless, if consumers fail to integrate it within their pragmatic encounter with the world (Kennedy 2012). Valueless waste is commonly referred to as garbage, representing all those uncanny objects which in the consumer's eyes are doomed to be trashed. On the other hand (S2), consumers experience a range of objects as valuable, despite their intention to discard them (e.g. clothes, furniture). Paradoxically, while these objects may be waste(d) for individual consumers, they are nonetheless attributed value and are often exchanged. Thus, we refer to these discards as commodities.

Each bottom unit of the semiotic square (,) is a contradiction to either garbage or commodity according to the absence of some quality. *Valueless* (the absence of value) is the dominant quality of garbage. The absence of this quality is *non-valueless*. Intuitively, *non-valueless* is something which holds some kind of value. Yet differently from commodities, the value of the *non-valueless* is only potential, as it cannot be directly accessed by consumers under current conditions. Usually, this means that the object must undergo a process of transformation, before consumers can access its value. Nonetheless, consumers are able to imagine its potential future value. For example, discarded paper presently fails to integrate with consumers' pragmatic encounter with the world; yet consumers envisage that these discarded objects can generate value again whether they undergo a recycling process. Therefore, we refer to as recyclable items to identify all the objects which, following consumers' inter-

pretations, have value potential whether new conditions of usage are established (e.g. the object is recycled).

Finally, the non-valueless is related by contrariety to the non-valuable (). This complements the valueless (S1) as the non-valuable is the immanent possibility of valuelessness. However, the non-valuable is not not-valuable, but rather invaluable. Invaluable objects are objects that consumers would rather not discard, such as inalienable family heirlooms (Curasi et al. 2004). Hence, we refer to as inalienable possessions.

To sum-up, our semiotic square represents the complex system of contradictory meanings which consumers attribute to their (potential) discards. Instead of contributing to dichotomizing the view on waste as the opposite of value, our starting point was that waste is both valueless and valuable. Based on this insight, our model identifies four different categorization waste to which consumers relate differently. In the following section we illustrate these assertions through an analysis of empirical data.

Empirical contextualization

Table 1 (see Appendix) synthetizes the units of meaning identified by our semiotic square and relate them to illustrative references from our data. These references show how consumers interpret different objects as belonging to one category of waste or another. It must be noted that the same type of object can belong to different categories. As different types of objects are subject to different value

APPENDIX
Table 1 - Consumer emic interpretations of waste

Unit of meaning	Illustrative references
Garbage (valueless): objects perceived as having no value (as they fail to integrate with consumers pragmatic encounter with the world).	"Yes. I feel like… maybe I made some food on Monday, but first remember that on Friday. Then I smell it and think "It smells nice" and I heat it up anyway. Then the germs are gone, so I wouldn't think of throwing it out. But if I open it on, say, Tuesday and it smells bad, then I would never eat it" (Focus group 1, reference 1). "Yeah, also sport stuff like shoes, or in my case tennis rackets, which I use a lot. The material is broken, so I have to throw it away." (Focus group 2, reference 1)
Commodity (valuable): objects still perceived as fully or partly valuable, despite being discarded.	"Moderator: Does that apply to you too? You said a bag, a Gucci bag, it lasts for many years. Participant 5: Yes, you can try to sell it again. Participant 8: Yeah, there's a lot to gain with those Yeezys that Kanye West produces… Participant 7: Yeah, and then you really don't care if seven people have owned them before you. Participant 8: Yes, so there are many things that are exchanged and traded if they have some kind of value. But I think it's a lot about value." (Focus group 1, reference 2) "It can also be a matter of principle if you have paid 8-900 DKK for a pair of trousers or shoes and then you put it up for sale and there is someone saying; I think it's worth 60 DKK. Then I throw it out rather than give it to you - I think you're a fool." (Focus group 2, reference 2)
Recyclable items (non-valueless): objects with potential value, which cannot be accessed by consumers under present conditions.	"Participant 4: Well, broken clothes, I try to repair with the sewing machine. Or if it's too broken to be repaired, I sometimes keep that piece and try use with something else – like sometimes you just need a piece of cotton, or whatever. Or if I really don't like this T-shirt – or whatever it is – anymore, like… Once a year I go to my wardrobe and say 'OK that I haven't worn the whole year. It can go to second hand'. So, I never just throw things out right away. Sometimes I use that old T-shirt for cleaning my shoes or something." (Focus group 5, reference 1)
Inalienable possessions (non-valuable): objects whose value cannot be assessed (invaluable).	"With clothing, it is very different. If it's a sweater in a color that I don't use, it goes. But if it's an old favorite shirt, I can keep it, even if it's filled with holes and too small. Now, I threw out a jersey that was three years old and it was really ugly, but it was just a jersey - I don't know how - but it meant something to me. So, it took me a long time, though it should have been thrown out a year and a half ago" (Focus group 3, reference 1) "Participant 8: My mother is giving me such gifts for advent. Actually, they can only be used around Christmas and other times it is so ugly you don't want to have it standing - but you do not throw it out - it is from one's mother. Participant 7: No, exactly. Participant 8: And if one day she asks about it ... Participant 7: It's right here! Participant 8: The third mug... [*everyone laughs*] I don't use it! " (Focus group 6, reference 1)

regimes (i.e. arrangements of valuation) (Appadurai 1988) and our study focuses on consumers' general interpretation of waste, we cannot give an exhaustive explanation of the specific dynamics affecting the movement of objects within the units of the proposed framework. Nonetheless, our analysis reveals three general dynamics explaining this movement: 1) the material status of the discarded object; 2) its cultural biography (i.e. the network of meanings historically attributed to the object) (Kopytoff 1988); 3) its potentiality (the value that the discarded object may release whether associated with future practices). While existing research is familiar with the first two dynamics, it seldomly considers waste for its potentiality. In the next section, we invite future research to elaborate on the dynamics affecting consumers' categorization of their discards.

DISCUSSION AND CONCLUSION

Waste is a complex phenomenon, which has increasingly been the object of study in consumer research. This paper offers a framework that synthetizes consumers' multiple interpretations of their discards, relating the valueless and the valuable under the notion of waste. Our model specifies four predominant consumer interpretations of waste: garbage, commodity, recyclable items and inalienable possessions. This conceptualization offers a more nuanced explanation of consumer understanding of their discards, which in previous research are often dichotomized as either worthless trash or valuable objects. We show that relation between valueless and valuable discards is highly dynamic and more unstable than previous research intended it to be.

The strength of our model lies in the purported dynamism of waste. Indeed, the four connotations of waste identified by our semiotic square are not static categories. Their boundaries are porous and the same object may shift from one category to another depending on the specific interpretation (see Türe, 2014 for a similar argument). As seen in the case of food or clothes, consumers perceive these objects sometimes as garbage, and sometimes as items to be repurposed. We suggest that the object's materiality, biography and potentiality may explain differences in classification as more or less valuable waste. While previous studies have examined the material and biographical dimensions of discards, examinations of the potentiality of waste are virtually absent. Therefore, we invite future research to employ our model in order to specify how different types of objects moves around the units of meaning of the proposed framework.

For example, decision-making approaches could look at what factors impact consumers' identification of objects with the different units of meaning. Under which conditions do consumers categorize food as garbage? And when do they see it as having potential value? What motivates consumers to shift their interpretive category? How do lifestyles (Aschemann-Witzel et al. 2018), political ideology (Kidwell et al. 2013), or product perception (Trudel and Argo 2013) impact consumers' categorization of discard objects as garbage, commodity, etc.? These questions are of the utmost importance if we want to understand how to better include consumers' decisions in the design of sustainable market systems, such as those based on circulatory model of resource regeneration.

Furthermore, our model offers a starting point for exchange perspectives investigating the institutional dynamics organizing discard exchanges. In Germany, for example, the practice of recollecting edible food from dumpsters prompted a reconsideration of supermarkets food discards from valueless to valuable waste, and a consequent reorganization of market arrangements for collection and redistribution of supermarket food waste (Gollnhofer 2017a). In France, the practice of urban gleaning is characterized by a discursive negotiation between sustainability concerns and issues of public hygiene (Guillard and Roux 2014) which alternatively frame curbside discards as garbage or commodities. These examples suggest how future research can build on our model to understand which actors, practices and discourses affect the movement of objects from one waste category to another. Such knowledge can generate practical implications on how to change consumer waste perceptions and (detrimental) habits; as well as the market arrangements and social norms sustaining those. Therefore, our research represents an important step towards a better understanding of sustainable consumption systems that ideally do not know valueless waste.

One-Armed Bandit? An Intersectional Analysis of
Kelly Knox and Disabled Bodies in Influencer Marketing

Jonatan Södergren, Stockholm Business School, Sweden
Niklas Vallström, Canterbury Christ Church University, UK

INTRODUCTION

Recently marketing scholars have called for more intersectional perspectives to be employed in the research field (e.g., Ginder and Byun, 2015; Hearn and Hein, 2015; Kearney, Brittain and Kipnis, 2019). As indicated by the different sociopolitical identities that were once excluded but are now increasingly represented on the cultural scene, more voices are allowed to be heard in current mediascapes (Tsai, 2010), yet multiple inequities seem to remain. For instance, Gopaldas and DeRoy (2015) highlight the acute lack of intersectional diversity on the cover of lifestyle magazines such as GQ, Cosmopolitan, and Vanity Fair. Meanwhile, 230 out of 240 intersections of sexuality, class, age, and race remain invisible in mainstream advertising (Nölke, 2018). The aim of this study is therefore to analyze the complexities of a particular disadvantaged identity position, namely that of physical disability—which according to Kearney et al. (2019) constitutes one of the largest minority groups—in the empirical context of influencer marketing, a field that has grown exponentially in popularity over the last few years (Lou and Yuan, 2019; Ahmad, 2018). As such, we take into consideration the rendezvous of intersectional diversity and influencer marketing discourse.

Why intersectional diversity? As noted by Gopaldas and DeRoy (2015), conventional notions of diversity stress the inclusion of e.g., ethnic minorities or people with disabilities. However, the emerging notion of intersectional diversity stresses the inclusion of not only different categories, but also various intersections of those categories (Collins, 2010). Thereby, rather than studying diversity from the vantage point of either ethnic minorities or people with disabilities, an intersectional approach would recognize the sociopolitical identity position of being an ethnic minority with disabilities. More specifically, Gopaldas and DeRoy (2015) argue that intersectional diversity is necessary "because conventional notions of diversity tend to inadvertently neglect intersections of multiple historically oppressed identities (p. 334)." They further note that such identities seldom are made visible in marketing and media imagery. At those occasions when these intersections momentarily are made visible, they are often represented in unfavorable ways. This was, for instance, the case when the Swedish Public Employment Service was criticized for cropping out the faces of disable-bodied people in a recent campaign, exchanging them with the faces of celebrities instead (Rågsjö-Thorell, 2019).

Why influencer marketing? Influencer marketing is a marketing strategy that uses the influence of key individuals or opinion leaders, often on social media, to drive consumers' brand awareness and/or their purchasing decisions (e.g., Brown and Hayes, 2008; Scott, 2015). More precisely, Lou and Yuan (2019, p. 59) define a social media influencer as:

> First and foremost a content generator: one who has a status of expertise in a specific area, who has cultivated a sizable number of captive followers—who are of marketing value to brands—by regularly producing valuable content via social media.

Gopaldas and DeRoy (2015, p. 359) call for future research on intersectionality to "go beyond lifestyle magazines and print media to investigate intersectional patterns of invisibility and travesty in other contexts such as social media." As noted by Lou and Yuan (2019), present-day social media and social networking sites such as YouTube, Instagram, and Snapchat have dramatically affected how young people receive information and news. Social media influencers, following Lou and Yuan (2019), could thus be seen as online personalities with large numbers of followers across one or more social media platforms, who also exert an influence on their followers. In contrast to celebrities and public figures, however, they point out that social media influencers are generally ordinary people who have become online celebrities by posting on social media. Because social media influencers often are perceived as trustworthy by their followers (Swant, 2016), brands and marketing practitioners have come to invest in selected influencers to create and/or promote their branded content to both the influencer's own followers and to the brand's target consumers (Weinberg, 2017). For instance, as noted by Talavera (2015), influencer-produced branded content is considered to have more organic, authentic, and direct contact with potential consumers than brand-generated advertisements.

On the one hand, we argue that increased visibility of disable-bodied intersections of identity in advertising imagery and influencer-produced content can contribute to cultural progress; on the other hand, disable-bodied influencers run the risk of being exploited by the hegemonic powers that seek to make a profit by their social identity, e.g., through face-ism, idealization, exoticization, or exclusion (see Schroeder and Borgerson, 2005), which puts issues of authenticity into question. Therefore, we formulate the following research question:

Q: How can brands produce content in collaboration with disable-bodied models and/or influencers without misrepresenting them?

The paper is organized as follows. We first review extant literature specifying the theoretical gap that we address. Then, we present the qualitative methods employed for critical visual analysis. This is followed by a discussion of the findings and contributions.

PERSPECTIVES ON DISABILITY IN CONSUMER RESEARCH

This year marks the thirtieth anniversary of the Americans with Disabilities Act, an additional decade has lapsed since consumer product advertisers first began to include portrayals of people with disabilities in their product advertising (e.g., Wong, 2020). Despite growing presence in the literature as manifested in a series of innovative articles by Stacey Baker and Carol Kaufman-Scarborough, however, consumer research on people with disabilities still seems to be in its infancy. In a landmark study, Baker (2006) shows how consumers with visual impairments participate in the marketplace to achieve consumer normalcy. More specifically, consumer normalcy "reflects how identity is constructed and maintained in part through shopping and is defined as a desire to live like other consumers, be accepted as other consumers are, and be acceptable to one's self in consumption contexts (p. 41)." She also notes that a crucial dimension of consumer normalcy is the desire to be perceived as equal in the marketplace, which is consistent with a basic need for all people to feel like they belong (Goffman, 1963). In a similar vein, Childers and Kaufman-Scarborough (2009) studied the enabling opportunities offered by the Internet for disabled consumers who are shopping online, whereas Baker and colleagues (2007) studied cues that dis-

able-bodied consumers use to make judgements as to whether they belong or feel welcome when shopping. Their findings reveal that it is critical for service personnel to consider them as consumers first, and as possessing a disability only under those conditions where the interaction of a servicescape element and the disability warrant special attention, as it otherwise might lead to feelings of discrimination. This argument is further developed by Kaufman-Scarborough (2015) who suggests that biases based on e.g., disability, gender, ethnicity, etc. can erect barriers to consumer participation and form a foundation for marketplace exclusion; as a result, some consumers are regularly excluded from the marketplaces they seek to experience. While disability studies has examined issues such as access to commercial venues, improvements in public transportation, and public attitudes toward the disabled (e.g., Kaufman-Scarborough and Baker, 2006; Saatcioglu and Ozanne, 2013), the focus of this study is on media portrayals and inclusion of disabled people in advertising. An estimated 13.9 million disabled people are currently living in the UK with a spending capacity worth around £249 billion per year, meaning that disabled people now make up 22% of the UK population (UK Government, 2018). Yet, to the best of our knowledge, no research has studied disable-bodied representation in a marketplace context. In effect, researchers have institutionalized an ableist approach to consumer behavior (Campbell, 2008) with the underlying assumption that disability is viewed in overtly negative light (Kaufman-Scarborough, 2015; Garland-Thomson, 2004).

METHOD

We choose to focus our qualitatively oriented analysis on Kelly Knox, a British fashion model and social media influencer born without a left forearm but, from the age of seven, refused to wear a prosthetic arm and since then has never used a prosthesis. In 2008, she was the winner of the BBC Three Reality TV show, *Britain's Missing Top Model*. Since then she has collaborated with brands such as Primark, Samsung and Dove. In another career highlight, she was cast alongside Jack Eyers whose leg was amputated when he was sixteen, for the British design duo Teatum Jones in their politically charged opening show of London Fashion Week, which offered an original soundtrack that e.g., included an extract from Meryl Streep's speech at the Golden Globes where she denounced President Trump for his alleged mocking of a disabled journalist (Finnigan, 2017).

The data set primarily consists of 295 archive images from the *itskellyknox* Instagram profile. We also take into consideration the criticized *Gör plats!* campaign by the Swedish Public Employment Service as well as *Rust and Bone*, a 2012 French-Belgian romantic drama starring Marion Cotillard as a woman who trains killer whales in a marine park, suffers a horrible accident, and loses both her legs above the knee. The underlying motivations for this seemingly diverse selection of material is that we wanted to be able to analyze and compare different modes of disable-bodied representations and narratives. In total, we ended up with 323 pieces of visual material.

With the aim of deconstructing misrepresentational mythologies (e.g., by unpacking some of the complexities of how body normalcy conceptions are constructed in advertising imagery), a critical visual analysis was conducted (Schroeder, 2006; see also Molander, Kleppe and Östberg, 2019). Employing this method, Schroeder (2006) argues that "researchers gain a more thorough (yet never complete) understanding of how images embody and express cultural values and contradictions" (p. 303) and that "[t]he relationship between description and interpretation is intricate, but, ideally, interpretations emerge from descriptive details" (p. 304). Within the realm of this study, the analysis focused on (i) *thematic analysis*, i.e., describing emergent themes in the visual material; (ii) *aesthetic analysis*, i.e.,

focusing on how form signifies dominance; and finally (iii) *affective analysis*, i.e., reflecting on emotions that were evoked during the analytical process. Additionally, the analysis was guided by the four representational tensions identified by Schroeder and Borgerson (2005). First, *face-ism* describes how the media systematically depicts the dominant group with more prominent faces and how disadvantaged intersections are negatively affected by this representational convention. Second, *idealization* concerns how marketing communications routinely depict ideal types, such as unrealistic scenarios or unattainable goals, and the negative effects these often have. Third, *exoticization* refers to the process of making 'Othered' intersections of identity seem exotic and/or fetishized in ways that call attention to the specific identity characteristics. Finally, *exclusion* indicates how certain sociopolitical identities traditionally have been left out of the pantheon of marketing communication altogether. By employing these techniques, we also take into consideration methodological issues such as (i) what social media means for visual consumption; (ii) how social media images circulate in consumer culture and relate to brand meaning; and (iii) what are the social and ethical implications of relying on such imagery in marketing communication?

DISCUSSION

Due to the word limit, our findings are briefly presented around three key themes. First, we make a case of Kelly Knox and her social media presence to develop the concept of epistemic disclosure. Second, we draw on the criticized *Gör plats!* campaign by the Swedish Public Employment Service to illustrate how incorporation inadvertently could serve as a source of marketplace exclusion. Finally, the film *Rust and Bone* is taken into consideration to frame authenticity in regard to portrayal of disable-bodiness as recognizing the complex personhood of the subject.

In elaborating the relation between identity and representation, Schroeder and Borgerson (2005, p. 583) define epistemic closure as "an ethical concept calling attention to the danger of typified representations of identity that increases the probability of human subjects interpreting what they experience or have represented to them as (stereo) typical." However, present findings based on Kelly Knox and her social media presence suggest that influencer-produced content, in fact, could disseminate what we refer to as epistemic disclosure, i.e., representations that de-naturalize damaging images and stereotypes about sociopolitical identity. For instance, addressing some of the questions she is most frequently asked in an Instagram post (see figure 1), she attracted dozens of supportive comments in line with "*I look forward to your posts everyday at the moment, feel like I'm always learning something new when I read them*" and "*Society can always use a wake up call every now and again and if we all looked the same life would be pretty boring. I think you are stunning.*" Others praised her for helping to change society's perception of beauty.

Meanwhile, despite their best intentions to create awareness and job opportunities for people with disabilities, the Swedish Public Employment Service's campaign inadvertently ended up neglecting this historically oppressed group. For instance, in one of the criticized advertisements, they cropped out the face of Natalie Chanise Eriksson, an influencer who suffers from cerebral palsy, exchanging it with the face of Therese Lindgren, a non-disabled celebrity influencer instead (Rågsjö-Thorell, 2019). In the advertising image, they clumsily raise the question, "Would she have become a powerful influencer?" However, the discrimination did not end here; they also changed Erikson's dark skin to match Lindgren's whiter hue, which from an intersectionality perspective indicates a double exclusion.

Finally, Gordon (2008) begins her book on social exclusion and invisibility by stating that life is complicated. Yet in regard to ad-

itskellyknox My strong East End roots go back generations. My Soul goes back millions of light-years across thousands of dimensions, galaxies, planets + existences. ✨👽🐆🤍✨
People may ask "how do you manage with one hand?", "What is it like missing a forearm?" Etc etc
Firstly, I am not "missing" anything.
I am a whole and complete person.
Do not define my existence by my body.
I am more than a body.
In previous liftimes, in a galaxy far away - I didn't even have a body.
My body is not who I am.
See my Soul.
I have memories of being pure light, connected directly to Source.
This is why I never felt "disabled"
From ever since I was a little girl, I innately knew my soul holds all the power, magic, beauty, wisdom and force.
🎬 @jakub_koz
@milkmodelmanagement .

Figure 1. Example of epistemic disclosure from Kelly Knox's Instagram feed.

vertising and media portrayal of people with disabilities, questions remain as to whose life is recognized as complex. For Gordon (2008, p. 5) complex personhood is about many things, including "conferring the respect on others that comes from presuming that life and people's lives are simultaneously straightforward and full of enormously subtle meaning." In that sense, we propose that branding and marketing practitioners who want to produce content by collaborating with disable-bodied models and/or influencers can learn from Marion Cotillard's graceful performance in *Rust and Bone* where the dynamics and consciousness of her disability is portrayed as more dense and delicate than often is implied.

CONCLUSIONS

Inclusion of people with disabilities in brand-generated advertising and influencer-produced content can contribute to social change, e.g., through epistemic disclosure as we argue is the case with Kelly Knox. However, as noted by Kearney et al. (2019, p. 562), "not all means of representation are viable means of inclusion [as it] in some instances, can result in opposite (even if unintended) outcomes." This was the case when the Swedish Public Employment Service was criticized for cropping out the faces of disable-bodied people in a recent campaign, exchanging them with the faces of ce-

lebrities instead. Counterintuitively, it would thus seem that incorporation could serve as a source of marketplace exclusion. Finally, we conclude that branding and marketing practitioners who want to produce authentic content by collaborating with disable-bodied models and/or influencers also need to recognize their complex personhood, e.g., through accurate and realistic representations that acknowledge the variability of their experiences.

The Identity Construction Of The Inbetweener, Through
Food Consumption: "You Are What You Eat"

Amandeep Takhar, De Montfort University, Leicester, UK
Hatice Kizgin, University of Bradford, UK
Thomas Magede, De Montfort University, UK

INTRODUCTION

With increasing migration, there is a need to explore how immigrants construct identity. This study analyses how two ethnic communities, in the U.K construct identity, in relation to food consumption practices. Findings suggest that food is an acculturative and reacculturative agent, to adapt to social situations, which reflects their identity.

"During the last five decades, considerable waves of human migration have changed the sociocultural fabric of many Western societies. The influx of migrants has not only brought about countless new forms of constructive collaboration and creolization among immigrants and indigenes but also contributed to considerable discrimination, exploitation, and ethnic group conflict" (Luedicke, 2015, p.109)

Within today's global consumer culture, consumer researchers have become increasingly aware of the significance of the relationship between consumption and the consequential identity politics (Calhoun, 1994). Scholars (Phinney, 1996; Breakwell, 2014) have increasingly focused on how individuals from ethnic minorities consistently struggle with what they have described as the "riddles of recognition" (Pieterse, 2008), in answer to the question of self-identity (Okamura, 2010; Stayman and Deshpande, 1989). Appiah (2018) recently highlighted that people have multiple identities that are relationally constructed and contradictory. Moreover "our sense of self is shaped by countless affiliations, such as nationality, culture, class, races and religion" (Appiah, 2018, p.41), however contradictions exist within collective identities. Arnould and Thompson (2005) suggested that there was a need for more contextual research, and whilst scholars have attempted to address this gap over the years (Ustuner and Holt, 2007; Luedicke, 2015). This research study addresses this call by investigating two specific ethnic communities within the U.K. This study investigates the identity construction processes and the experiences of young Indians and Zimbabweans as they engage in food consumption practices. The population under study is defined as the "inbetweeners"; young Indians and young Zimbabweans who have spent part of their early childhood in their country of origin India or Zimbabwe and the latter part of their childhood or teenage years in the U.K.

Consumer Acculturation Theories and Identity

Consumer researchers have previously suggested that ethnic minorities who have migrated may construct their identities around consumer acculturation levels and may adopt acculturative identity positions (Askegaard et al., 2005; Holt, 2007; Oswald, 1999; Peñaloza, 1994) that are static. Research has extensively highlighted, that the acculturation process is not only between host and heritage cultures, but ethnic minorities interact and learn from other ethnic minority communities (Askegaard et al., 2005). Berry et al. (1989) and Peñaloza (1994) have widely contributed to acculturation research. However, despite highlighting the potential for navigating in-between two cultures, literature exploring the acculturation attitudes/behaviors linking to consumption choices remains limited (Kizgin, Jamal and Richard, 2018). Dey et al., (2019) recently proposed that

"consumer interactions in multicultural environments demands that the scholarly debate on acculturation strategies be revisited" (p.773). Previous studies suggest that consumers navigate between the host and home country cultures (Oswald, 1999; Peñaloza, 1994). However, more recently it has been proposed that consumers are likely to be influenced by other "ethnic minority cultures, global consumer culture and more multinational cultures" (Dey et al., 2019, p.773). Hall (2014) argued that identities are not static, rather a process "always constituted within and outside, representation" (Hall, 2014, p. 35). Research supports the notion of bi-directional acculturation strategies, largely based on the extent that ethnic consumers can retain elements of their ancestral culture and adopt the host country's culture simultaneously (Dey et al., 2017; Kizgin et al., 2018). Ustuner and Holt (2007) did of course engage in an acculturation study, described as "post-modern consumer acculturation" (p.41). While prior consumer acculturation research has contributed to theory, it is important to recognise that consumer acculturation is not only a process of consumers "adjusting their consumer identities and practices to unfamiliar sociocultural environments" (Luedicke, 2015, p.111). Nonetheless, the literature generally remains silent in explaining how identity construction or "identity projects" (Ustuner and Holt, 2007) are a never-ending fluid construct.

Consumer Reacculturation

In fact, with the increasing levels of migration and the diminishing borders, consumer researchers have investigated the notion of reacculturation (Takhar, 2011; Takhar, 2012a; Wamwara-Mbgua, 2006), whereby ethnic immigrants focus on adopting the customs and traditions of their heritage culture, through consumption and ritualistic behavior, within an environment that is not their ancestral homeland. Moreover, the notion of reterritorialization (Askegaard et al., 2005; Ustuner and Holt, 2007), whereby immigrants "recraft a sense of community and cultural identity in new socio-geographic contexts" (Punathambekar, 2005, p.152) has also been acknowledged. However, explaining consumer "reacculturation" and its impact on identity construction processes and behaviours remains an understudied area. Takhar and Chitakunye (2012a) investigated mealtime rituals and food consumption practices amongst 3rd generation Sikhs. They suggested that consumers consistently negotiate their identities based on their levels of acculturation and reacculturation, through their food consumption practices (Ahmad, 1998). Recently, Rauf and Prasad (2017) suggested that food consumption can be a "social bridging activity" (p.833) whereby the sharing of food can solve what they describe as "cardinal social problems" (p.834). We address this shortcoming and investigate how the food consumption practices of Indian and Zimbabwean individuals ("inbetweeners") impact their ongoing identity construction processes and use the experiential, symbolic, ideological and socio-cultural elements of food consumption. In doing so, this study assesses how these factors impact identity structure.

Methodology

We engaged in two comparative studies, looking at two ethnic communities in the U.K. We adopted an interpretive research strategy and used a multiple methods approach. Study 1 focused on re-

cruiting Indian informants between 18-30, and they were encouraged to generate their own visual diaries (n=23), which in total produced over 300 photographs. The visual diaries involved informants taking pictures of their food consumption practices and they were then asked to make some comments on these diaries. Due to time limitations, eleven informants participated in online in-depth interviews, whereas twelve engaged in face to face in-depth interviews. Where we received permission, we conducted family observations of mealtimes i.e. in the family home or a restaurant. Consistent with prior research, we adopted multiple methods (Denzin (1997; Takhar and Chitakunye, 2012b) to determine multiple voices. The small sample size enabled a more focused attention related to food and consumption rituals on a day to day basis and develop a richer understanding of the meanings surrounding the consumption of food at mealtimes.

Study 2 adopted multiple methods (Morse, 2009), and recruited a sample of Zimbabwean informants. Two types of qualitative data were collected for two reasons. Firstly, to understand the experiences of the individual inbetweeners. Secondly, to understand how the marketplace for Southern African food products and environments could be used by the inbetweeners to negotiate and construct their identity. Snowball sampling was adopted and a sample of 16 inbetweeners aged between 23-30 was recruited. The procedure of snowball sampling was selected as Zimbabweans are a small population within the U.K. and difficult to reach (Bloch, 2007). Semi-structured interviews were conducted at different venues across the U.K.

Within both studies we focused on adopting an iterative and incremental process in the analysis of the different data sets (Cresswell, 2012). We focused on moving back and forth between the data of both studies to identify potential emergent themes. We also moved between the theory and the multiple emerging data sets, to be able to obtain a deeper meaning with regards to how food consumption practices impact the identity construction of these young "inbetweeners".

Findings

The data demonstrates that the experiential, symbolic, sociocultural and ideological aspects of food consumption significantly impact the ethnic identity construction processes of the inbetweeners for both groups. The findings indicate that participants did not simply consume food to fulfil a primitive (physiological) need, but moreover they were consuming the associated meanings, ideologies, symbols and experiential aspects of the food itself. We found that these "inbetweeners" used food consumption in three key ways with regards to identity construction: 1) food as a representation of roots and ancestral identity, (2), food consumption as a tool of identity negotiation and (3) food as a representation of the (inbetweener) identity. The interview data is illustrated in Table 1.

Food as a representation of roots and ancestral identity

The experiential consumption of food that represented their ethnic roots, was clearly an experience, highly associated with emotions. It encouraged informants to reflect on their own identities and in turn impacted identity construction. Interestingly, the "home" was a place where the Indian and Zimbabwean "inbetweeners" consumed ethnic food the most. This finding clearly resonates with that of Ustuner and Holt (2007), as they described how individuals recreated village life in the city. These young inbetweeners are clearly reminiscent of ethnic food consumption as a way of identifying with their ethnic roots. Yet at the same time they referred to food consumption within the workplace as "Western foods", conveying a preference for their ethnic food at home, because this is where they were able to recreate aspects of their ethnic roots. Informants from both the Indian and Zimbabwean community attach cultural, communal and multi-

sensory meaning to food consumption. Informants described the different meanings that they took from food consumption as being part of their identity. It was evident that participants-controlled food consumption experiences, because of the ideologies they had associated to that particular food. Informants described specific interpretations that they had of food and the messages that were transmitted through the consumption of it i.e. if they were consuming ethnic Indian or Zimbabwean food, it was interpreted as being better for their health, as they had been told this by previous generations. Informants' preference for ethnic food relates to the conviction that they were not "white" like their U.K. peers. It was apparent that the "inbetweeners" were in fact "inbetweeners", as they were trying to deal with a whole host of issues relating to identity. They were influenced by the older generations and their teachings, their peers and the beliefs that were formed by their experiences of their homeland and their host culture.

Food consumption as an identity negotiation tool

The "inbetweeners" clearly engaged in a process of identity negotiation as they reflected on the food that they consume or should consume. It was apparent that between the experiences of home, where ethnic food was predominantly consumed, there was a process of identity negotiation. Where young informants were highly aware of the importance of consuming food and creating food rituals that helped them to conform with their peers. This perhaps could be described as "felt food ethnicity" (Stayman and Deshpande, (1983). Where they developed a taste for Western food, yet they held the ingrained belief that their ancestral food was better for their health, as affirmed by older generations. Nonetheless, they wanted to be seen to be adapting to their peers and their environment. Therefore, informants described this process of trying to balance how and what they consumed. For example, they knew it was acceptable to eat ethnic food at home or in a specific restaurant, but they were also aware that within the work environment they would take a "sandwich or pasta salad". In fact, Christmas was a key season where informants referred to eating turkey and following the norms of Christmas, as anything else would be considered out of the ordinary. On the other hand, one informant was very aware that she had to pack a specific "westernised" packed lunch for her young daughter, though she was told by her mother-in-law that she should not be eating too much English food. In this way it can be seen that the "shape of one identity can be contoured by another" (Appiah, 2018, p.41).

Food as a representation of "the inbetweener" identity

These young informants who had migrated to the U.K. demonstrated a preference for food that represented their "inbetweener" identity. In fact, informants conveyed a preference for what we have described as hybrid "inbetweener" foods. Where they described their ethnic food as being highly flavoursome, they described the English food as being highly bland and having to adapt foods i.e. adding lots of chilli to sandwiches or pasta. Both the Zimbabweans and Indians conveyed a preference for Nando's food, as it was seen as a hybrid representation of their identity i.e. it was what they described as "food with a kick". They therefore felt it represents a mix of English and ethnic (Indian or Zimbabwean) because it was spicy. Food consumption was a "social bridging" tool for these young "inbetweeners". In fact, it was evident that in a way these young "inbetweeners" had created a sub-cultural "inbetweener" community of their own, around food consumption, as they were able to relate more effectively to this group of people as they consumed food, whilst simultaneously addressing "cardinal social problems" (Prasad, 2017) that they were experiencing.

Table 1: Interview Data

	Food As a Representation of Roots and Ancestral Identity
You are what you eat (Study 1)	"when I eat Indian food, I don't know why but I feel more Indian and content and I know it makes my grandmother and mum happy because she thinks I'm being more Indian and its weird I somehow feel proud of myself eating Indian food"
You are what you eat (Study 2)	''I am Zimbabwean … out of … 7 days, 5 days we eat sadza in the house. So, you know I am Zimbabwean. And definitely, sadza defines me …. Because in Zimbabwe you eat sadza all the time and we barely ate rice and that's the same thing we are still doing here''.
Constructing and interpreting identity (Study 1)	"this sounds funny, but I look at the Indian culture and the food is so tantalising and tasty and vibrant and its kind of like the culture isn't it? But with English food like fish and chips, its like okay yeah it tastes okay once a week with friends, but not everyday, it gets bland and maybe that's how I see the culture"
Constructing and interpreting identity (Study 2)	''Zimbabwean food is still in my house, but I have to mix with other foods. You see experience and exposure in school and when I am with my friends is good because you do not want to miss out on their good food. Mixing my Zimbabwean food with other foods is ok with me''
	Food As An Identity Negotiation Tool
Food Consumption an adaptation agent Study 1	"I know which food that I eat where and somedays I get fed up of eating cheese sandwiches for lunch, but I know I can't take roti (chappati) cause it doesn't seem normal to me. "
Food consumption as an adaptation agent Study 2	"I am a typical Zimbabwean and U.K person. I am aware I do consume Zimbabwean food, but I am also aware in some situations I cannot be eating Zimbabwean food; I have to adapt and eat UK food and other foods. I used to have just the Zimbabwean culture. That's just the way I used to see things. But coming here you have UK culture, you have got the Asian culture, you have got other different cultures from Africa as well that I have sort of integrated with... Yah, so definitely I have integrated with the UK culture and food"
Situational Food Ethnicity Study 1	"growing up here we have routines, at school we had packed lunch sandwich or school dinner like mash, sausages. But on Saturdays and Sundays we always knew it was parotay, not rice krispies"
Situational Food Ethnicity Study 2	''although most of the times I have Zimbabwean food there are times I'm craving UK food, then I don't know if it's really UK food because it's sort of that food which is just pasta, spicy food and chicken curries''
	Food As a Representation of "The Inbetweener" Identity
Transformation of food to reflect the inbetweener Study 1	"when you add mirch (chilli) and masala (spice blend) to food, it always tastes better. When we make pasta that's what we do, we add it too the food, even my grandmother will eat it then lol"
Transformation of food to reflect the inbetweener Study 2	''British food was very tasteless. When I got here and even up to now, I have to put a lot of spices for me to enjoy their bland and tasteless food''
Collectively consuming the inbetweener identity Study 1	"for me food is very social, it's about eating with people who have my food tastes and that I can understand. So, most of my friends are Asian and we like Nando's, cause it tastes a bit Indian but I like chips too and the have that spicy taste"
Collectively consuming the inbetweener identity Study 2	''I have friends that come from different places. Jamaicans like their Jamaican food quite a lot. Obviously, they like that and they have introduced me to their food while visiting their house when they have cooked some food. I will try that and say, "oh that's nice". I also have friends from Ghana and Nigeria …. They are like "oh I am cooking Jolof rice today would you like some?" and I will be like "yes I would like some". They will bring me a tub at home and we share''

Conclusion

This research study contributes to existing consumer research, by investigating and comparing two very unique immigrant communities in the U.K. This study also looks specifically at the role of food consumption and the associated practices and how this encourages these "inbetweeners" to reflect on their identity and behaviors, as they engage in food consumption. It is evident that food is used as a catalyst to socially identify with aspects of their identity, at any given point in time. It is the food consumption rituals, that help them to feel comfortable with their roots, but at the same time gives them a sense of comfort in conforming to their peers.

It is evident from the findings that food consumption plays a pivotal role in trying to build relationships and maintain social systems. Food is an acculturative (Penaloza, 1994; Luedicke, 2015) and reacculturative (Wamwara-Mbgua, 2006; Takhar, 2012a) agent that enabled these young "inbetweeners" to socially adapt and adjust to their peers in various social situations, as they attempted to understand their own identity projects (Ustuner and Holt, 2007). In fact, it is interesting from the third finding that they clearly tried to adapt Western foods, with their own ethnic spices and created "inbetweener" foods that were symbolic of themselves and their own tastes as "inbetweeners". It seems that they adapted and created their own foods, contributing to a "fusion" of different cultures, while attributes of these cultures contribute to their identity, thus resulting in the fluid "inbetweener" identity.

Food is also seen as a way of socially categorising themselves and used as a means to try to break down social barriers. It was evident that the creation of the socially representative "inbetweener" dishes that are described or the preference for food like Nandos, is symbolic of the identity that they hold at any one time. They are neither wholly, Indian nor Zimbabwean, nor British, nor do they belong to a specific sub-culture at any one time. However, it is evident that food helps them to own elements of all these cultures at any one time, yet they mix and match the proportions on their own terms at any given point in time.

As immigration increases this is an opportunity for businesses and marketers to take note of the growth of this group of 'inbetweeners'. The adaptations of foods by the inbetweeners to create foods that represent their identity, is an important finding that can assist marketers to understand the need for adapting their foods to meet the demands from this group. There is opportunity for businesses to improve their offerings for this increasing segment of consumers that have experienced the 'best of both' countries. Businesses adapting their products to reflect these changes among their ethnic consumers are poised to experience positive perceptions from these communities.

Value Creation and Destruction in Consumption Practices

Débora Bogéa da Costa Tayt-son, Fluminense Federal University, Brazil
Leticia Moreira Casotti, Federal University of Rio de Janeiro, Brazil
Ana Raquel Coelho Rocha, Fluminense Federal University, Brazil

INTRODUCTION

Value refers to the benefit perceived by the consumer in a person, an object, or an activity (Figueiredo and Scaraboto 2016). Value has been the subject of a long history of research in the fields of marketing and consumer behavior (Bagozzi 1975; Holbrook 1999; Holbrook and Hirschman 1982; Humphrey and Hugh-Jones 1992; Levy 1959; Zeithaml 1988), and has recently garnered more attention. Authors of previous studies have argued that aside identifying value typologies, it is also important to understand how values are created (Arsel 2016; Karababa and Kjeldgaard 2013; Venkatesh and Peñaloza 2014), destroyed (Echeverri and Skålén 2011; Plé and Chumpitaz Cáceres 2010; Smith 2013), and analyzed using different theoretical lens (Arnould 2013). The present study aimed to understand how values can be created and destroyed in sun consumption practices. We use the term *sun consumption* based the definition proposed by Warde (2005, 137), which states that consumption is a process in which "...agents engage in appropriation and appreciation, whether for utilitarian, expressive or contemplative purposes, of goods, services, performances, information or ambience, whether purchased or not...".

Until the 20th century, sun consumption was linked to a dominant pattern of light skin valuation, indicative of higher socioeconomic positions. Rich people avoided sun exposure, thus differentiating themselves from those who worked in agriculture and had more tanned skin (Keesling and Friedman 1987). This stereotype reversed in the 1920s with the adoption of tanned skin by fashion influencers, such as the French fashion designer Coco Chanel. Tanned skin has thus come to signify wealth, as it is now indicative of plentiful time and financial resources to dedicate to leisure (de Souza et al. 2004). Heliotherapy promoted the association of tanned skin with health in the 1940s. This practice prescribes daily sunbathing to prevent or cure illnesses (de Souza et al. 2004). Concerns and research regarding heliopathy, pathological disorders caused by sunlight, appeared in the 1940s. However, the most alarming findings in this area of research did not appear until the 1960s, when some people began to present with tumors resulting from sunlight exposure (Keesling and Friedman 1987).

The literature regarding value creation (Gummerus 2013) has helped us to understand sun consumption in view of the historical relationship established between human beings and the sun. These works challenged the mainstream, focused on typologies of value (Humphrey and Hugh-Jones 1992; Zeithaml 1988), by proposing a paradigm shift from the discussion of marketing techniques and concepts to understanding the market as a social construction (Peñaloza and Venkatesh 2006).

The consumer behavior literature on value creation has failed to take into account the potentially negative results of consumption interactions that may lead to value destruction. Studies on value destruction can only be found in service marketing literature (Echeverri and Skålén 2011; Plé and Chumpitaz Cáceres 2010; Smith 2013). One may infer that if value can be co-created, then it can also be co-destroyed (Plé and Chumpitaz Cáceres 2010). If co-creation refers to the process in which providers and consumers collaboratively create value, then co-destruction refers to the collaborative destruction or decrease of value (Echeverri and Skålén 2011) resulting from the misuse of resources (personal, informational, and technological) during interactions between different service systems (Plé and Chumpitaz Cáceres 2010).

The present research was inspired by the proposal to develop a practice theory of value (Arnould 2013) that advocate the use of Practice Theory (Schatzki 2001) in value studies and offer a solution to the problem of agency and structure commonly found in social theories. In a practice theory of value, the unit of analysis is centered on the practice rather than the individual or the structure (Reckwitz 2002). Consumption occurs to the extent that goods are appropriate during engagement in particular practices (Warde 2005). The practice functions as nexus of *saying* and *doing*, meaning these concepts are linked in some way. This link involves understanding what to say and do, procedures or rules, and engagements (Warde 2005).

Many products are directly related to the conduction and reproduction of daily life, meaning that there is a material dimension of practice that deserves attention (Warde 2005). Various authors of consumer behavior research have attempted to include the material dimension in the analysis of practice (Magaudda 2011; Shove and Pantzar 2005). Magaudda (2011) proposed the *Circuit of Practice*, composed of three main analytical elements (meanings, doings, and objects) that constitute practice as a whole entity. Meanings function as rules that reflect knowledge about something to do. Doings provide skills, which comprise the knowledge and abilities that are acquired as people perform practices. Finally, objects are resources that can be used by people to achieve their goals. In the present research, the circuit of practice was used to explain the dynamics of practice change and transformation.

This study aimed to answer the following question: How are values created and destroyed in sun consumption practices?

METHOD

This work can be characterized as narrative research (Lieblich et al. 1998; Shankar et al. 2001). Seventeen semi-structured interviews were conducted with Brazilian women residing in Rio de Janeiro aged 20 to 70 years old. The city of Rio de Janeiro has been represented by aspects such as the beach, the sun, the ocean, seminaked bodies, carnivals, youth, and freedom (Goldenberg 2002). The interviews were conducted at the respondents' residences, and each lasted 60 minutes on average. Recordings of the interviews were transcribed, generating 133 pages for analysis. Codification was initiated through a gradual induction process (Lofland and Lofland 2006) with Atlas.ti software, generating a total of 306 codes grouped into three dualities of practices.

FINDINGS

The omnipresence of the sun triggers choices and submissions, as there are situations wherein the sun cannot be avoided. This context proved useful for understanding the value creation and destruction practices associated with tensions in the following positions: the consumer's relationship with their body (intrapersonal), their relationship with materiality, and their relationships with others (interpersonal).

INTRAPERSONAL PRACTICES

Practices involving the body were observed in relation to value creation in the participants' statements that the sun provides "balance

for the body and the life," "gives a lot of wellbeing," "invigorates," and "is a source of energy". One participant suggested that people may lack energy or become depressed without the sun. The sun was also connected to the body in participant statements indicating that value can be created or destroyed as a result of both sun tanning and prevention practices. Sonia (59 years old) stated that the "sensual tan line" of a bikini on a sunburned body, although typically desired, is also associated with discomfort because one can "feel stinging all over". She also stated that "information" has led people to grow more "careful" about the "dangers of exposure," evidencing the existence of different actors performing in the market of sun consumption (Karababa and Kjeldgaard 2013).

Interviewees indicated several dilemmas related to sun consumption and beauty. Although exposure to the sun can create positive aesthetic value, providing a "beautiful tan" and thus the appearance of a "health[y] face," it can also be a source of value destruction. For example, tans can create "painful burnt skin", "blemishes", and skin diseases. Another dilemma was noted when the image of an "extremely pale" woman "who doesn't get sun" was associated with prevention strategies that imply efforts such as the repeated use of sunscreen. However, the suntan aesthetic appeared to prevail in associations with beauty, as the participants reported their dislike of "pasty skin." The image of a suntanned woman with a "healthy look" and with aesthetics "linked to beauty" appeared to be admired and desired. This admiration, however, was accompanied by the use of "protection" during sun consumption because the participants had "access to information" about the "sun['s] harmful impacts on aging and health."

Although the participants seemed to have internalized the need to wear sunscreen, reports suggested that this strategy was not always followed. As Janet (34 years old) said, "the fear of having skin cancer" did not overcome "laziness" with respect to the systematic application of sunscreen.

MATERIAL PRACTICES

Objects were central to the mediation between sun consumption and the body. In recounting a visit to the beach with her husband, Amanda (35 years old) linked her "awful memory" to the use of an expired sunscreen, which caused "sunburns," "peeling skin" that was "very red," and "stinging pain." The purchase of another unexpired sunscreen with "a super high SPF" was crucial to her recovery of value. Another account that pointed to materiality as a mediator in the value recovery process focused on the sun's excessive brightness, which may create visual difficulties. Sunglasses, hats, and beach umbrellas were noted as fundamental mediating accessories in cases of sun exposure. Judith (50 years old) reported that her "sensitivity to light" may prevent her from going to the beach or walking in the streets on sunny days without sunglasses.

We identified several spaces that take the role of mediators in the recovery of destroyed value. Particularly, shopping malls and movie theaters were recalled because they offer amenities, such as air conditioning, that are capable of recovering the value of a sunny day, which may be destroyed by high temperatures. These spaces were described by interviewees as alternatives to avoid the "high energy cost" of staying at their homes with their air conditioners turned on.

The sun also appeared as a mediator in the value creation process. Some of the interviewees' memories accounted for the sun's presence or absence as a decisive or organizing element. Anna (54 years old) said that the weather is an important mediator in her decisions regarding outfit selection, assigning notions of heat and light clothes to sunny days and cold and heavy clothes to rainy days.

While discussing her organizing logic on weekdays and weekends, Joana (50 years old) referred to the sun as an element capable of "turning on the switch" of her routine, stating that "depending on the weather, [she] plan[s] [her]self."

INTERPERSONAL PRACTICES

Velho (1999), a Brazilian anthropologist, stated that the value of the beach as a socializing space, motivated people to visit this place more often. Participants in the present study suggested that sunny days motivate "meetings," "chats," "laughter," "being with people," and drawing "everybody together." Experiential aspects of consumption (Belk et al. 1989) were also highlighted, as phenomena such as leisure activities and sensory pleasures were important parts of the interviewees' behavior.

Sun holds positive associations and creates value by enabling social activities, but some accounts suggested that the presence of the sun also lead to negative associations. Some participants reported that they felt "pressured" or "obliged" to enjoy and prefer sunny days, to look "happy" and "joyful," "to hangout and have fun," and "to be with a bunch of people" even though these feelings and behaviors were not always genuinely desired. For example, there is a popular Brazilian song that says "*Cariocas* [Rio natives] don't like cloudy days" (Calcanhoto 1994), an idea frequently repeated by the general media. Alternatively, Clara (41 years old) named her favorite song as one that celebrates a day without sun (Azevedo 1996). Judith (50 years old) reported experiencing a "tormenting duel" between liking rainy days—which may be more "reflective" and productive for studying—and not seizing sunny days, which she feared could lead her to "[miss] some part of [her] life."

DISCUSSION

Findings showed that multiple practices work together in a process of value creation and destruction, even with the omnipresence of the consumption object. This was the first contribution that the sun context brings to the literature, revealing that value creation and destruction occurs even when individuals have less agency to either expose themselves to consumption or avoid consumption. The interviewees disclosed that they were aware of the sun's omnipresence, decided on the practices that would bring them benefit (i.e., create value), and understood that they were subject to practices that could compromise their relationship with the sun (i.e., destroy value). This research was not limited to the analysis of practices involving value creation, which is common in consumer behavior studies (Schau et al. 2009). On the contrary, it was possible observe how practices in the context of sun consumption could also lead to value destruction, a concept neglected in consumer behavior field.

The idea that practices are formed by meanings, doings, and objects (Magaudda 2011) allowed us to assume that a practice will create value for the consumer when these elements are aligned. In contrast, a practice may destroy value when a single element is not aligned. For example, one interviewee recounted her experience with an expired sunscreen, which left her with negative memories of her trip relating to skin burns. In this case, the object did not perform its function, causing misalignment and destroying value. Another interviewee described a situation in which the absence of the sun was preferred, as its presence could have exerted unwanted social pressures and obligations, which contrasted with the positive meanings often associated with the sun. In this case, there was a misalignment between the interpretive scheme constructed by the interviewee, in which unwanted obligations were associated with sunny days, and the activities she needed to perform (e.g., studying), which were more introspective and solitary and therefore should not have oc-

Table 1: Value creation and destruction in consumer practices

Practices in Sun Consumption	Value Creation and Destruction		
	Aspects of Value Creation	Core Tension	Aspects of Value Destruction
• Intrapersonal Practices	• The sun "invigorates" • Positive aesthetic value (i.e., a "beautiful tan")	Practice elements aligned versus Practice elements misaligned	• Discomfort (i.e., the "pain of burnt skin") • The "dangers of exposure" (i.e., skin cancer)
• Material Practices	• Products and spaces function as mediators • The weather functions as an organizer of daily events		• Problems with products (i.e., expired sunscreen) • High temperatures on sunny days
• Interpersonal Practices	• Socialization		• "Pressure" (i.e., to be happy)

curred on those days. Doings can also cause misalignments. For example, the respondents associated the use of sunscreen with laziness as well as the qualities of being repetitive and tiring. In this example, skills were misaligned, leading to sun consumption practices capable of destroying value. Table 1 summarizes these findings.

FINAL CONSIDERATIONS

The literature on value supports this study, which explored a concept academically marginalized in the field of consumer behavior research: the destruction of value as a result of consumption practices. The omnipresence of the sun allowed for both value creation and destruction to be identified and analyzed simultaneously because consumers cannot control the presence of the sun.

This work also contributed to the empirical articulation of ideas and categories developed in different studies that have addressed value creation and destruction as well as practice theory. Findings showed that these practices can generate positive results to the extent that their components are aligned (value creation) or can generate negative results to the extent that their components are misaligned (value destruction). This investigation also advanced the study of value co-destruction. While co-destruction reinforces the existence of a misalignment between at least one of the different elements of a service system, some of the experiences reported by participants in this study showed that misalignment can also occur outside of the context of services.

This work, which took a microsocial perspective, had several delimitations, including the theoretical lens of practice theory, the context of sun consumption, and a focus on women. In this way, opened several avenues for other studies of consumption, particularly studies of practices resulting in value destruction. Finally, recommendations for future research reinforced the main findings of this study, which criticized the openly positive bias of research on value in the field of consumer studies.

Masculinity May Mean Different Things in Different Contexts

Tabitha S Thomas, Unaffiliated

INTRODUCTION

When one is asked to imagine a masculine person, what is it that comes to mind? Past research shows that people have a tendency to link masculinity with external factors such as a fabulous physique (e.g. height, broad shoulders) and internal factors such as courage, independence and hiding emotions like sadness (e.g. real men don't cry; Bem 1974; Brozo and Schmelzer 1997; Holt and Thompson 2004). These masculine stereotypes are strongly engraved inside male brains because of cultural norms, societal norms and the way men are generally portrayed in the mass media. Prior research demonstrates that the pursuit of toxic masculinity has resulted in severe problems such as body dissatisfaction, eating disorders, depression, anxiety, and low self-esteem related issues in men (Burlew and Shurts 2013). What if men are forced to think about masculinity differently? For example, how would a person describe their father's masculinity, friend's masculinity, or professor's masculinity? Will their answer resemble one of the Marvel Comics superheroes? The response may be a yes or no depending upon the person answering the question. The primary objective of the present research is to show that when men are made to think about masculinity in different social contexts or roles their response to what they perceive as being masculine varies.

THEORETICAL BACKGROUND

Conceptualization of Masculinity

The Oxford English Dictionary defines masculinity as a set of qualities that characterize a man. Although masculinity varies culturally, the traits most societies consider manly remain consistent (Hofstede 1984). The prominent theories of masculinity are the breadwinner model, the rebel model, and the man-of action-hero model (Holt and Thompson 2004). In the breadwinner model, men are hard workers who are committed to their careers and chase after material success. The rebel model defines men as reckless, wild, uncivilized, immature, or anarchic, who also possess facets such as charisma and exceptional physical skills. The man-of action-hero model embodies components of both the breadwinner and the rebel model i.e. while men in the man-of action model are rugged and rebellious, they also consider the collective interests of others. In summary, masculinity has been allied with attributes such as assertiveness, dominance, competence, independence, strength, ambition, and aggression in the extant literature.

The Impact of Masculine Culture on Men

The social construction of masculinity has significantly influenced the way men think, feel, and behave in their day to day lives. For example, in the consumption context, men connect masculinity with excessive alcohol intake, drug abuse, sexual risk-taking behavior (Giaccardi et al. 2017; Lindsay and Lyons 2018), eating too much meat (Rozin et al. 2012), driving sports cars (Avery 2012), and taking part in radical gym workouts (Moore et al. 2019). Men who internalize such masculine norms simply refuse to participate in any act that threatens their macho image. This specific behavior is found to be highly prominent in the presence of other men (Nikolova and Lamberton 2016). Masculinity not only prevails in an external setting but is also strongly present in an internal setting (Moisio et al. 2013). For example, Moisio et al. (2013) reveal that men at home prefer engaging in household tasks such as fixing/assembling furniture, barbecuing, or plumbing to other domestic activities. Likewise, Brough et al. (2016) found that men had problems using environmentally friendly products or adopting to green behaviors because of the stereotypical relations between green behaviors and femininity. In conclusion, masculine norms have shaped the identity of men both inside and outside their homes.

How Stereotypes Shape the Way Men Think About Masculinity

Stereotypes help individuals categorize information and predict their experiences (Hilton and Von Hippel 1996). People use stereotypes to simplify their social world. What this simplification means is that people are cognitive misers. The human brain cannot begin to look afresh at every new situation; thus, it builds on what it has witnessed before (Blair, Ma, and Lenton 2001). Masculine stereotypes are like any other stereotype, i.e. when men are made to think about masculinity, they are bound to recollect and categorize information that they already know. For example, a man may link manliness with a great body due to being repeatedly exposed to male body ideals presented in the mass media. The question is, how can toxic masculine stereotypes be changed? The solution is not that simple. One way to bring about a change would be to make men think differently about masculinity in general. That is, would masculine stereotypes alter if men are to associate masculinity with the love and care of a father, the hard work that a professor puts into imparting knowledge in class or how a male friend cries with another male during troubled times.

The Present Research

The present research argues that perceptions of masculinity reflect a wide range of different behaviors and actions, and that different facets of masculinity can be activated in different social roles or settings. A drawing method was implemented to see if men responded to masculinity-related stereotypes in different social settings or roles. In the past, the drawing method has been successful in understanding physical attractiveness-related stereotypes in children (Thomas 2019). And so, in the present research, a drawing method was considered ideal to explore masculinity stereotypes in adults.

METHOD

Participants: 183 males between ages 18-20 years (*M*age = 19) participated in the drawing study. The participants were recruited using a convenience sample.

Procedure: Participants were divided into six groups. Each participant belonged to only one group. The participants were given an A4 size sheet of paper, a pen, and were asked to draw pictures of men. Participants in group 1 (*N* = 30) drew a picture of a masculine person. Participants in group 2 (*N* = 31) drew a picture of their father's masculinity. Participants in group 3 drew a picture of their own masculinity (*N* = 30). Participants in group 4 (*N* = 30) drew a picture of their friend's masculinity. Participants in group 5 (*N* = 31) drew a picture of their professor's masculinity. Lastly, participants in group 6 (*N* = 31) drew a picture of an army officer's masculinity. Following the drawing task, the participants were asked to write down few words describing the masculine characteristics of the men present in their pictures. The participants were thanked and given a small reward for taking part in the research.

Analysis: The analysis and interpretation of 183 drawings and texts were performed in line with those adopted by Thomas (2019). To understand masculinity-related attributes across six drawing conditions, two drawing conditions that were similar were assessed. For instance, the drawings of a masculine person and an army officer were compared because these two conditions met the socially constructed view of masculinity. Likewise, the father and professor condition drawings were put together for evaluation because a father or a professor is a person known to the participants; and age-wise a father or professor is most likely to be older than the participants. Lastly, the self-drawing condition and the friend's masculinity drawing conditions were compared with each other because a friend is a peer and probably the same age as the participants.

FINDINGS

Masculine Person and Army Officer: The drawings and the texts present in the masculine person condition and the army officer condition were found to be similar (see Figure 1). The descriptive words associated with a masculine person and an army officer are shown below.

"He is tough and is carrying weights on both arms. He has the perfect abs, chest, arms, and biceps. All the chicks go wow !!!" – Participant in the Masculine Person Condition

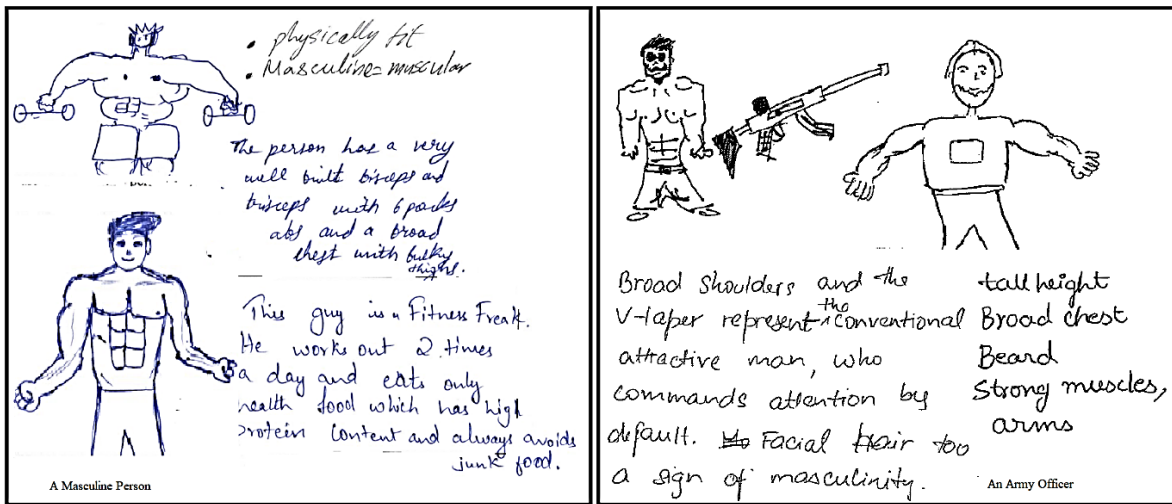
"He is muscular, strong, and has six-pack abs. He has good lungs and can run fast. His muscularity should help him hold his gun and fire at the enemy. He has a good short hairstyle" – Participant in the Army Officer Condition


Figure 1 Drawings done by participants in the masculine person condition (on the left) and army officer's masculinity condition (on the right)

Figure 2 Drawings done by participants in the father's masculinity condition (on the left) and professor's masculinity condition (on the right)

Father and Professor: In the father's masculinity condition, most of the drawings comprised of a fat, bald person with a protruding stomach (see Figure 2). In the professor's masculinity condition, the drawings contained a non-muscular person wearing glasses and formal clothing (see Figure 2). The words used to describe a father or professor's masculinity varied based on the relationship that the participants appeared to share with their father or professor. Examples of positive words include:
Figure 3 Drawings done by participants in the friend's masculinity condition (on the left) and self-masculinity condition (on the right)

"He is loving, caring, very hardworking and provides for the family" – Participant in the Father Condition

"He is friendly, soft-spoken, supportive, and helpful" – Participant in the Professor Condition

Examples of negative words used by the participants to describe their father's masculinity and professor's masculinity.

"He is arrogant, stubborn, and his expectations are too high" – Participant in the Father Condition

"He is grumpy, judgmental, seems smart but he is dumb" – Participant in the Professor Condition

Friend and Self: In the friend's masculinity condition, most drawings were depicted as being skinny (see Figure 3). Both positive and negative words were used by the participants to describe their friend's masculinity. For example:

"He is physically fit. But no six packs. He is healthy and looks smart" – Participant in the Friend's Masculinity Condition

"He is hairy, thin, skinny, short, and creepy" – Participant in the Friend's Masculinity Condition

In the self-masculinity condition, most participants drew pictures of faces with the rest of the body missing. Some participants drew pictures of random objects such as a brick, a tree, a jigsaw puzzle or a motorbike instead of a human face or figure to represent their masculinity (see Figure 3). Also, when participants were asked to describe their own masculinity, they tended to focus on internal aspects of appearances instead of external aspects. For example:

"Masculinity is about the mental strength to overcome hard situations with confidence" – Participant in the Self-Masculinity Condition

"I am weak in physical appearance. But good at my work and sharp at learning things" – Participant in the Self-Masculinity Condition

SUMMARY

The findings showed that masculinity related stereotypes were present across six drawing conditions. For example, when participants were asked to think (draw) about masculinity or a profession that signifies high masculinity (e.g. army officer), their assessment of manhood aligned with the socially constructed view. However, when participants were asked to think differently, i.e. draw their father, professor, friend or their own masculinity, their responses varied. For instance, a professor's masculinity was related to wearing glasses and non-stylish formal clothing which fits in with the general stereotypical notions of a professor. A father's physical appearance was linked to obesity and a friend's to being very thin. When participants were asked to draw their own masculinity, most of them drew only a face with facial hair (body missing). This might be because the participants may have felt embarrassed, insecure, or biased while evaluating themselves than while assessing others. In addition, when men were asked to describe a masculine person or an army officer, they related masculinity to external strength, great physique, and courage. However, when men were asked to talk about their father, professor, friend, or their own masculinity, a majority of them linked masculinity with internal factors such as kindness, the right to express feelings/emotions (e.g. men do cry), to be hardworking or mentally strong.

CONCLUSIONS

The present research is the first to show that in varied social settings or roles men view masculinity in a different way. This study is

also the first to use drawings as a method to understand masculinity-related ideals and stereotypes in adults. A limitation of this paper is that due to its qualitative nature, the causal effect cannot be determined. For instance, this paper does not explain why men possess certain masculinity stereotypes in the six drawing conditions. Likewise, the findings of the study cannot be generalizable because of the subjectivity element present in qualitative research. Therefore, quantitative methods such as experimental studies need to be undertaken in the future to make the findings generalizable and explain causality. Future research can also look at considering gender (men vs. women) and age-related differences (older vs. younger) while examining perceptions of masculinity. Finally, based on the empirical support provided, the present research raises the possibility that toxic masculinity perceptions in men could be changed if they are made to think about masculinity in a non-conventional manner.

Children Perceive Beautiful People to Own Better Material Things

Tabitha S Thomas, Unaffiliated

INTRODUCTION

Past research shows that adults who value materialism and beauty-related ideals are more likely to be narcissists, engage in compulsive buying behaviors, and suffer from problems like anxiety, depression, and low self-esteem issues (Dittmar 2007; Kasser 2016). Understanding the beauty-materialism link in children is vital because stereotypes formed during a phase where children's brains are developing can not only impact their socio-cognitive abilities in the present, but it can also lead to severe psychological problems during adulthood (Bigler and Liben 2007). Even though the beauty-materialism link is widely seen in the mass media (e.g. attractive celebrities endorsing luxury brands) and its impact has been found to be negative in adults (e.g. Ashikali and Dittmar 2012), researchers studying children have not considered the beauty-materialism linkage as their primary research question. However, while investigating a different research problem, prior scholars have identified the beauty-materialism link as one of their findings (Banerjee and Dittmar 2008; Thomas 2019). For example, Banerjee and Dittmar (2008) while examining the correlation between materialism and peer popularity found that popular children were also considered to be attractive and brand conscious. Likewise, Thomas (2019) while exploring perceptions of beauty in 6-12-year-old children found that attractiveness was not only related to physical features such as a beautiful face or a perfect body but was also connected with owning material goods. This paper addresses the gap in the extant literature by assessing the beauty-materialism link as the key research question. Importantly, the present research is the first to test the relationship between physical attractiveness and perceived ownership of material possessions.

THEORETICAL BACKGROUND

Materialism and Children

Materialism is defined in the extant literature as the central importance people place on possessions (Belk 1984; Richins and Dawson 1992). Children's attachment to material objects is formed at an early age. For instance, toddlers and preschoolers express their desire for certain products by nagging, crying, and seizing things off store shelves (John 1999). However, interpreting the symbolic meanings that material things convey (i.e. the status and prominence associated with certain products) develops in children only during middle childhood to early adolescents (Chaplin and John 2005). Typically, children by ages 8-9 start using products and brands to signal their identity to their peers. The materialistic inclinations, however, peaks in children between ages 12-13 (Chaplin and John 2007). Further, past research shows that children from poorer families (Chaplin, Hill, and John 2014) and those with low self-esteem (Chaplin and Lowrey 2010) lean towards being more materialistic than others. Prior studies demonstrate that parents also play a significant role in instilling materialistic values in their children. For instance, the use of material objects by parents to express love or to correct their child's behavior has resulted in children making ties between possessions and rewards or punishments (Richins and Chaplin 2015). In conclusion, scholars have (1) defined materialism, (2) shown the importance of material goods in children's lives, (3) identified the ages at which materialistic tendencies begin and peak, and (4) found the mediators for high versus low materialism levels in children. This paper provides evidence for showing how owning material goods is becoming an integral part of the beauty-is-good stereotype.

The Beauty-is-Good Stereotype in Children

According to the beauty-is-good stereotype, children perceive attractive peers to have more positive characteristics than normal looking or unattractive peers. For example, Rennels and Langlois (2014) and Griffin and Langlois (2006) find that children are more likely to consider their attractive peers to be well behaved, friendly, appreciative, adventurous, helpful, smart, more ambitious than others. The beauty-is-good stereotype is also evident in the mass media wherein highly moral characters (e.g. Cinderella, Snow White) are often portrayed as attractive and evil characters are typified as being ugly (e.g. the evil stepmother and queen; Bazzini et al. 2010). The literature on the beauty-is-good stereotype in children has mainly focused on behavioral outcomes (e.g. attractive children being perceived as nice or unattractive children being perceived as mean). The current study, however, proposes that beauty stereotypes are not just related to positive or negative behavioral outcomes but are also linked to the ownership of material possessions.

Hypothesis Development

Prior work in materialism shows that children use possessions to signal their identity and status to others (Chaplin and John 2005; Chaplin and Lowry 2010). The beauty-is-good stereotype literature reveals that attractive children are perceived as having more positive behavioral characteristics than others (Griffin and Langlois 2006; Rennels and Langlois 2014). The current study predicts that children are going to view attractive children with owning expensive possessions and less attractive children with owning cheap possessions. More formally:

> Hypothesis: Attractive (less attractive) children are perceived to own more expensive (cheap) possessions and few cheap (expensive) possessions than less attractive (attractive) children

METHOD

Overview of the Studies

To understand the links between beauty and materialism two studies were conducted. The objective of study 1 was to quantitatively test children's associations between beauty and materialism using an experiment. The objective of study 2 was to explore children's feelings and experiences pertaining to the beauty-materialism link using a story telling method. A storytelling approach was used because through the "construction of stories, individuals organize their experiences, create order, explain unusual events, gain perspectives and make evaluations" (Escalas 1998, 271).

Study 1

Objective: To test the hypothesis

Participants and Design: The present study used a between-subjects experimental design. The research design has been adapted from Langlois and Stephan (1977). The participants for the study were recruited from a large public school. Two hundred and forty children (49 % female, M_{age} = 9.35) completed the experiment. Most of the children belonged to lower to middle-class families. Ethical approvals and necessary permissions from the concerned authorities

and the participants themselves were obtained before the commencement of the study.

Stimulus Materials: Ten pictures, five for boys and five for girls, (see Figure 1) varying in physical attractiveness levels was created by a professional artist. Following the guidelines from previous research (Langlois and Stephan 1977), fifty-four undergraduate students were asked to rank the pictures from 1 to 5 in order of attractiveness levels. The attractiveness ranking order determined by the participants can be seen in Figure 1. The highest attractiveness level ranked picture (1) and the lowest attractiveness level ranked picture (5) were chosen as stimulus pictures for the experiment.

conditions. Since the stimulus pictures for female and male participants were different, one-way between-subjects ANOVA was conducted separately for female participants and male participants. For girls, there was a significant effect of physical attractiveness levels on owning expensive possessions for the attractiveness and less attractiveness conditions ($F (1,116) = 34.57$, $p < .001$). The results revealed that the mean score for the attractive condition ($M_{attractivegirl} = 2.22$, $SD_{attractivegirl} = 1.81$) was significantly different from that of the less attractive condition ($M_{lessattractivegirl} = 0.59$, $SD_{lessattractivegirl} = 1.07$). Similarly, for boys, there was a significant effect of physical attractiveness levels on owning expensive possessions for the attractive vs. less attractive conditions ($F (1,120) = 36.09$, $p < .001$). The re-

Figure 1 The stimulus pictures ranked from 1 to 5 in order of attractiveness levels (1 = Highest   5 = Lowest)

Procedure: The experiment was conducted inside a classroom at the participants' school. Each participant was tested individually. Following the guidelines from Langlois and Stephan (1977), the participants either saw a picture of a good-looking child (picture 1) or a less good-looking child (picture 5). Female participants saw only female stimulus pictures, and male participants saw only male stimulus pictures. After the participants had viewed the respective pictures (either attractive or less attractive), they were asked a set of questions that measured materialism.

To assess the participants' evaluation of the stimulus pictures (attractive vs. less attractive) they were asked to indicate 'yes' or 'no' while responding to questions. The questions relating to material success (owning expensive vs. cheap possessions) was adapted from Richins and Dawson (1992). Examples of the material success items include "this child's parent owns an expensive (cheap) car", "this child does not live in a big (small) house (reverse scored)", "this child wears branded (non-branded) clothes" and "this child has no money (reverse scored). The above items were combined, and a total score was calculated for analysis.

Manipulation Check. Analysis of the recognition check measured indicated that 77% of participants were able to correctly identify whether the picture of the child shown to them was attractive or not in the first condition. Similarly, 82% of participants were able to correctly recognize if the picture of the child revealed to them was less attractive or not in the second condition.

Test of Hypothesis. A one-way between-subjects ANOVA was conducted to compare the effect of physical attractiveness levels on owning expensive possessions in the attractive versus less attractive

sults revealed that the mean score for the attractive condition ($M_{attractiveboy} = 2.61$, $SD_{attractiveboy} = 1.63$) was significantly different than the less attractive condition ($M_{lessattractiveboy} = 0.94$, $SD_{lessattractiveboy} = 1.45$).

Similarly, a one-way between-subjects ANOVA was conducted to compare the effect of physical attractiveness levels on owning cheap possessions in the attractive and less attractive conditions. For girls, there was a significant effect of physical attractiveness levels on owning cheap possessions between the two conditions ($F (1,116) = 34.67$, $p < .001$). The results indicated that the mean score for the attractive condition ($M_{attractivegirl} = 1.34$, $SD_{attractivegirl} = 1.37$) was significantly different than the less attractive condition ($M_{lessattractivegirl} = 2.57$, $SD_{lessattractivegirl} = 0.81$). Similarly, for boys, there was a significant effect of physical attractiveness levels on owning cheap possessions for the attractiveness and less attractiveness conditions ($F (1,120) = 32.67$, $p < .001$). The findings indicated that the mean score for the attractive condition ($M_{attractiveboy} = 1.08$, $SD_{attractiveboy} = 1.25$) was significantly different than the less attractive condition ($M_{lessattractiveboy} = 2.29$, $SD_{lessattractiveboy} = 1.07$).

The hypothesis presented in this study was supported.

Discussion

The experimental study revealed significant differences between physical attractiveness levels and owning possessions. The findings showed that children perceived attractive children to own more expensive possessions than less attractive children. A qualitative study was added for the subjectivity element i.e. to understand children's feelings and to strengthen the findings from study 1.

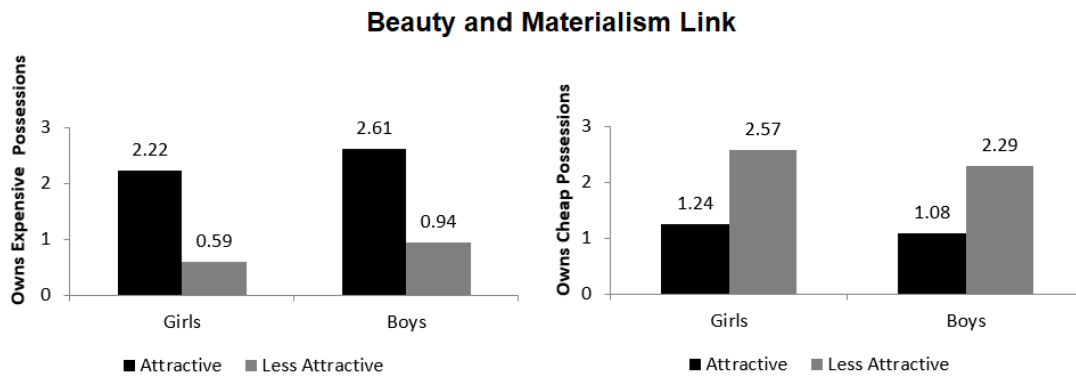
Beauty and Materialism Link


Figure 2 Means for expensive and cheap possessions owned

Study 2

Goal: To collect stories relating to children's feelings and experiences which an experimental study is not able to capture.

Participants and Procedure: The participants for the study comprised of twenty-four children (54% female, M_{age} = 8.7). In this study, children were asked to imagine and narrate how a good-looking child versus a less good-looking child spent their birthday. A birthday party context was chosen for the study as birthdays involve experiences (time spent with family and friends) and possessions (receiving gifts). The stories were transcribed, read back and forth, and analyzed using Braun and Clark's (2006) thematic content analysis process.

Results

(1) *Gifts, Fun, and Friends*: The findings revealed associations between beauty, receiving gifts, having fun, and the number of friends a good-looking or a less good-looking child had. The participants described the following:

"A good-looking boy would decorate his house, wear nice clothes, play games, and receive many gifts on his birthday…. However, a less good-looking boy receives no gifts, his house is not decorated with balloons, and he doesn't get to wear any party clothes" – 8-year-old boy

"The pretty girl's parents will buy her new clothes and host a fancy birthday party for her. She gets lots of gifts. The less pretty girl receives few gifts not many and wears old clothes" – 9-year-old girl

(2) *Venue for the Birthday Celebration:* The analysis revealed that the good-looking child spent their birthday at the following places. (1) A five-star hotel, (2) an expensive restaurant, (3) a foreign country, or (4) an amusement park. On the contrary, the participants stated that the less-good looking child spent their birthday at home.

"The pretty girl would spend her birthday in an amusement park. The less pretty girl's family is poor, and so she spends her birthday at home with a few friends, watching television, eating food and some cake" – 11-year-old girl

"The good-looking child will celebrate their birthday by going to an expensive restaurant or a foreign country A child who is not good looking would spend their birthday in their house with a homemade cake" – 12-year-old girl

Discussion

Study 2 confirms the findings of Study 1 by showing the beauty-materialism link. The participant responses indicated that the good-looking child was perceived to host a fancy birthday party at an expensive place for all their friends. The good-looking child was also perceived to cut a big cake and receive expensive gifts (e.g. toys, balloons, new clothes) from both their family members and friends. In contrast, the less god-looking child was perceived to have a simple birthday party and cut a plain or a homemade cake. The less good-looking child's parents were described as poor and therefore they could not afford to buy their son or daughter an expensive gift or throw a lavish birthday party.

CONCLUSIONS

The present research is the first to show a relationship between physical attractiveness and perceived ownership of material possessions. The results obtained from the experimental study and the story narration study contributes to the consumer behavior literature by revealing that beautiful people are not only seen to own better things (Study 1) but are also perceived to have better life experiences (Study 2). The limitations of the present research are as follows. First, while the present research highlights the relationship that exists between physical attractiveness and perceived ownership of material possessions, this research does not provide an explanation as to why this relationship exists in children. This particular shortcoming provides an opportunity for future research. Second, the current study has examined children's perceptions of others concerning beauty and materialism. Future research can investigate how children's perception of beauty or exposure to beauty will influence their own materialistic tendencies. Lastly, in the current research, female participants saw female stimulus pictures and male participants saw male stimulus pictures after which they were asked questions relating to materialism. Future studies can use cross-gender stimuli, followed by questions on materialism. A comparison can then be made to understand the same gender versus cross-gender responses concerning materialistic orientations and beauty stereotypes. In conclusion, the main take away from this paper is that "beauty isn't about wearing costly jewelry or fancy clothes or owning other expensive things, but beauty comes from within the unfading beauty of a gentle and quiet spirit" (1 Peter 3: 3-4). Hence, as a society we are responsible to educate, teach, and train children not to judge, discriminate, or treat people unfairly based on their physical appearance or the material possessions owned by them.

How #Flygskam Helped to Redefine the Environmental Sensitivity Concept

Leo Trespeuch, EGUQTR, Canada
Élisabeth Robinot, ESG UQAM, Canada
Béatrice Parguel, CNRS, Canada

INTRODUCTION

Greta Thunberg, environmental activist and Times Magazine personality of the year 2020, has helped reveal the environmental sensitivity (ES) of many individuals. ES influences many behaviours like "flygskam", or flying shame, "the movement that encourages people to refrain from flying to lower their carbon footprints" (New York Times, 2019). The movement made an impact, as airlines Easy Jet and Air France - KLM reacted quickly by announcing the compensation for the carbon emissions of their flights. This suggests that we must expand our understanding of ES in the context of accelerating climate change to include consumer's emotions like shame, guilt and anxiety.

On an academic level, ES and its impact on individuals' behaviours have fueled research studies since the 1980s as well as new terminology to designate environmentally sensitive consumers; "ecologically concerned consumers" (Kinnear, 1974), "socially conscious consumers" (Webster, 1975), "environmentally conscious consumers" (Schlegelmilch, Bohlen and Diamantopoulos, 1996), "environmentally sensitive consumers" (Chawla, 1998), and "green consumers" (Diamantopoulos *et al.,* 2003). However, these studies do not lead to a consensus on the identification of the underlying dimensions of these similar concepts. For example, Diamantopoulos *et al.,* (2003) compare 133 measures across three dimensions: environmental knowledge, attitudes and behaviour, before proposing a new measure in five dimensions of scales to measure environmental knowledge, attitudes, recycling behaviour, political action and purchasing behaviour, without considering the influence of recent climate change on people.

In this study, we will employ the term environmental sensitivity defined by Chawla (1998, p. 11) as "*a predisposition to take responsible environmental action.*" However, recent societal developments show that ES includes cold glow feelings like shame and anxiety, as opposed to "*warm glow of giving*" (Menges, Schroeder and Traub, 2005; Hartmann *et al.,* 2017). Another limit is the evolution of the impact of the societal dimension. Indeed, ES is a behaviour influenced and shared between individuals, such as at the 2019 Montreal climate march that gathered half a million people. Consequently, the egocentric measures of this construct no longer seem to suffice.

To respond to these limits, this article proposes an updated ES measurement by employing the Diamantopoulos *et al.,* (2003) technique. An exploratory qualitative study was first conducted. A quantitative study then enabled to propose and validate an ES measuring tool. The exploratory qualitative study was carried out with 27 participants and the quantitative study with 233 respondents. The end-product is a three-dimensional ES scale that considers environmental consciousness, eco-anxiety and cold glow. In terms of nomological validity, the results highlight that the environmental consciousness dimension significantly impacts the influence on the intention to reduce air travel, and the cold glow dimension positively influences the intention to offset the emissions of carbon linked to air travel.

LITERATURE REVIEW

According to Kinnear *et al.,* (1974), individuals who possess a strong ecological conscience have a sounder understanding of the environmental threat posed by increased human activity on the planet, such as industry. These individuals, through their purchases, go beyond their primary needs of satisfaction linked to the product and feel accomplished when performing symbolic consumer acts (Robinot, 2007). This strengthens their identity and their status in society (Solomon, 1983; Petkus, 1992). Initially, studies regarding environmentally concerned people were based on research to assess the degree of social responsibility of individuals (Webster, 1975). Kinnear, Taylor and Ahmed (1974) pointed out that social awareness is also expressed with regards to the environment. Hence, an environmentally concerned individual tends to minimize their negative impact on the environment at all levels of the consumption process, from acquisition to product disposal (Kreziak *et al.,* 2020). The consumer's purchase behaviour reflects a lifestyle in keeping with their values (Stern et al., 1999).

TWO PERSPECTIVES ON ENVIRONMENTAL SENSITIVITY (ES)

The exploration of ES may be done by using one of two perspectives: egocentric and socio- centric.

EGOCENTRIC PERSPECTIVE

The first approach groups studies that focus on identifying the behavioural determinants of ES individuals such as sociodemographic characteristics, attitudes and values.

Using purely sociodemographic variables leads to contradictory results (Kinnear *et al.,* 1974). Some studies show no correlation regarding age (e.g. Anderson *et al.*, 1974), whereas others demonstrate a positive relationship (e.g. Giannelloni, 1998). Diamantopoulos *et al.,* (2003, p.467) carried out a retrospective analysis of over 136 studies and measurements of ES published between 1972 and 1998. Their conclusions were that: "*the large majority of studies have failed to review all aspects of environmental consciousness and revealed several problems with sample selection procedures.*"

A great deal of research has focused on the connections between attitude and the various behaviours linked to environmental preservation (e.g. Kaiser *et al.,* 2003; Oreg and Katz- Gerro, 2006). This groundwork made it possible to establish a link between an individual's evaluative mental process (often unconscious) and their behaviour. Ajzen (1991), however, suggested that models such as Theory of planned behavior, be further investigated, including the role of emotions. Smith *et al.,* (1994) established that the association between attitude and behaviour linked to environmental concern is weak because of the lack of consideration for consumers' emotional reactions. Some authors have worked on positive emotions linked to responsible consumption. Giebelhausen *et al.,* (2016) show that engaging in sustainable actions causes "warm-glow feelings" which can lead to more favourable assessments of the consumer experience. Positive emotions could thus stimulate more sustainable behaviours (Onwezen *et al.,* 2013; Rezvani *et al.,* 2017; Soleil and Trudel, 2017; White *et al.,* 2019). Peter and Honea (2012) showed that positive emotions, such as joy and pride, can inspire people to reduce their consumption of plastic water bottles. To the best of our knowledge, no research, to our knowledge, has ever addressed how negative emotions can explain responsible behaviours.

Previous research confirms the association between ES and individual values. Values manifest lasting beliefs that one mode of behaviour is preferable to another. Stern, Dietz and Guagnano (1999)

suggest the natural environment would be a new value in contemporary societies. They suggest that individuals will, therefore, behave in an environmentally friendly manner if they understand their harmful consequences. Riis and Gundelach (1992) identified the evolution of generations, changes in the life cycle of individuals and periodic influences. Ultimately, these studies cannot prove a correlation between individual values and protective behaviour (Gärling *et al.*, 2003). Certain psychological mechanisms can block the spillover effect (Tørgersen and Ölender, 2003). As Schwartz (1977) explains, when the cost of behaviour modification is too significant for an individual, they will react with a post-rational defence. In this perspective, only collective action can solve environmental problems. An individual, on the other hand, will act according to social ethics and freedom of choice.

SOCIO-CENTRIC PERSPECTIVE

This approach groups work that advocates a global analysis of how individuals take the environment into account. The set of variables that can change collective behaviour are considered (Bagozzi, 1977; Shapiro, 1978). The need to effect social change to "promote, facilitate and ensure environmentally responsible behaviour" is highlighted (Le Gall, 2002). However, Le Gall (2002) emphasizes the absence of solutions for the implementation of a collective transition; the sustainable development movement. Furthermore, societal environmental awareness is the key to achieving more sustainable development. ForCorraliza (2001), environmental awareness emerges when certain actions based on values, beliefs and regulations try to reduce the negative impact of human activity on the environment. As stated by Grob (1995), to have environmental consciousness, emotions must be attached to the awareness that there are environmental issues, as they are often linked to people's behaviour. In this sense, certain feelings, such as shame about flying or guilt about polluting, are markers of the weight of collective opinion in individuals' behaviour. In this sense, Brennan and Binney, (2010, p.144) qualify shame "*as an emotion that individuals experience when other people who are significant to them become aware of their socially unacceptable behaviour*". For these authors, "*guilt and shame both carry messages about the moral consequences of one's action and "doing the right thing*".

Both approaches, egocentric and socio-centric, complement our understanding of ES. Certain aspects are specific to the individual; eco-responsible purchasing, intention to have a positive impact on the planet; whereas others express themselves through the group or awareness of human well-being, like feelings of shame or guilt. All these elements have led to updating the ES concept.

EXPLORATORY STUDY

To better appreciate the drivers of ES, 27 respondents were interviewed on how they think, feel and behave regarding the environmental impact of travelling by plane. The interviews were conducted using a guide divided into five themes: mobility and air activity, awareness of the ecological problem posed by air travel, individual reactions to this question, the conditions that would make it possible to change travel habits, and the relationship with ecology. The interviews lasted an average of 50 minutes each. The individuals were on average 46 years old.

RESULTS:

Environmental consciousness as defined by Diamantopoulos et al., (2003) have been founded in the interview: "*We close our eyes as usual. Ah-ah. It's terrible. But what I am saying is awful…no, no, well we think about it, yes. But if I already sort my trash… only buy*

local… and no more plastic… in a short distribution chain… without packaging… I don't use my car… I use a bike or public transport and that I only buy clothes that don't destroy the water and that…) (Interview-Extract1).

Eco-anxiety linked to climate change and the impact on humans and the planet emerged thought this phase : "*Not preoccupied… rather optimistic about the rise in consciousness, but worried that it won't spread globally. Some countries won't want because they aren't economically developed… We will have completely different opinions and politics. So, it will make the world even more differentiated*" (Group 1 Interview 4.)

Cold-glow feelings emerges from the interviews as a negative feelings related to the human impact on the environment. "*Um, no… honestly, I don't… well now I am starting to have a bad conscience, but seriously when I buy my plane ticket, I am not telling myself, "Oh no, I am polluting the planet!". I am starting. I am starting. I think flying is practical, its quick, but I don't like this method of transportation.*" (Group 1 _interview7).

The results revealed people's evolved ES. Based on the interviews, a three-dimensional construct was created. The three dimensions are environmental consciousness, eco-anxiety and cold-glow feelings. This last dimension is new compared to previous research.

MAIN STUDY

Methodology

Following the analysis of the responses obtained in Study 1, 5 experts generated 38 items associated with the 3 dimensions: environmental consciousness, eco-anxiety, and cold-glow feeling. A quantitative study with 231 respondents (made up of 153 women and 75 men) was performed to test the items and their nomological validity.

RESULTS

Principal component analysis (PCA) followed by Promax rotation allowed dimensionality examination and suggestions for item deletion. A three-factor solution with 11 items was the most appropriate solution based on a variety of common criteria: inspection of screen plot, interpretability, and eigenvalues greater than unity (D'Astous and Boujbel, 2007; Sung and Tinkham, 2005). The scale showed adequate convergent reliability and validity. All items had high factor loadings, and exceeded the cut-off point of 0.50 (Hair et al., 2009); reliability coefficients exceeded the cutoff standard of 0.70 (Murphy and Davidshofer, 2001); and AVEs were > 0.50 (Fornell and Larcker, 1981; Hair *et al.,* 2009) (see Table 1- in Appendix).

Conforming to Henseler *et al.,* (2016) guidelines, we used the suggested criteria for overall model fit and assessed each of the measurements and structural models. For the overall model, the SRMR value indicated an acceptable fit. The SRMR (0.090) was close to the recommended cut-off value suggested by Hu and Bentler (1999). Whalers et al. (2003), indicated that a relatively substantial amount of information is being considered at the measurement and structural levels.

The structural part of the model was subsequently studied. As stated in Figure 1, R^2 valuesare good, at 19% and 24%. All path coefficients prove statistically significant, with 'T' values greater than 2 and 95% confidence intervals that do not include zero.

Discussion - Conclusion:

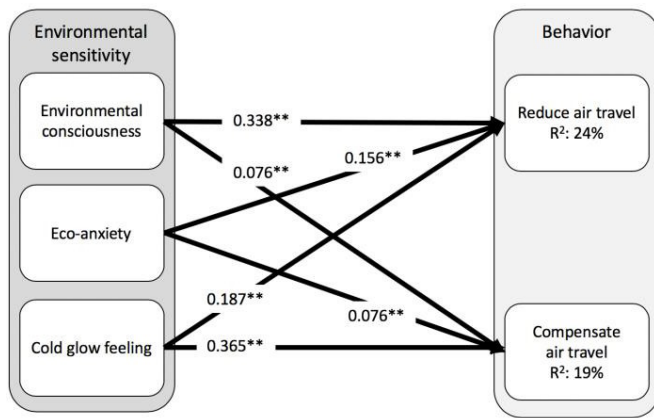
This study made it possible to propose an updated definition of ES to: "*environmental awareness associated with negative feelings (cold glow, eco-anxiety) which accompanies the adoption of*


Figure 1: Conceptual Model

pro-environmental behaviour". The integration of Negative feelings like environmental shame, eco-anxiety, are increasingly present in environmentalists' discourse on ES. It is therefore important to integrate these notions into previous research on the subject (Kinnear *et al.,* 1974; Diamantopoulos *et al.,* 2003; Schlegelmilch *et al.,* 1997; Webster, 1975; Hartmann and Apaolaza, 2006). With regards to the environment, the results are consistent with psychology studies that have already made associations between feelings of shame and guilt. (Damasio, 1994; Abe, 2004). Also, facing the socio-centric aspect of these feelings, which is lacking in most ES measures, these feelings could be "*Associated with a clearly understood moral obligation towards others*" (Brennan and Binney, 2010, p.143).

When considering the application of the ES construct, this study exposed a history that was expressed differently when it had the intention of either reducing air travel or compensating carbon emissions. This theoretical contribution is a source of recommendations for the tourism sector. Airlines are recommended to base their communication campaigns on carbon offsetting around social interactions. For example, with the possibility for consumers to share that their trip is carbon neutral on social networks to reduce the guilt and shame of flying and increase social acceptance. For environmental organizations, eco-anxiety and the desire to have a positive impact on the planet are the levers to use to encourage using other modes of transport when possible.

On the methodological level, this study offers a current measurement of ES in 11 items and 3 dimensions, which makes it possible to better understand the behaviours with a history associated with the environment. To strengthen the validity of this scale, it would be interesting to apply it to phenomena other than Flygskam and to other cultures, such as Asian cultures, where saving face appears as an important motivation for consumption choices.

To conclude, both studies in this research are concerned with negative feelings (Damasio, 2003; Damasio, 1994; Brennan and Binney, 2010) associated with ES. In the case of flygscam, these studies have revealed two levels of commitment: the most advanced ecologists in terms of environmental consciousness will reduce their air travel, while individuals who experience cold glow warming (shame and guilt) will further reduce their carbon emissions in response to a likely cognitive dissonance.

Appendices Table 1.

Dimensions	Items (with p value 0,000)	Loading	Outer Weights	Cronbach's Alpha	Composite Reliability	Average Variance
Environnemental consciousness	I am trying to have a positive impact on the planet	0.861	0.406	0.816	0.868	0.569
	I do my best not to buy from companies that pollute	0.808	0.320

Understanding Consumer Activism in Digital Environments

Philipp K. Wegerer, MCI Management Center Innsbruck, Austria

INTRODUCTION

In the Austrian Alps, a conglomerate of regional corporations planned to connect two ski resorts in order to create the world's largest glacier ski destination. Just before local authorities approved the project, a local grass-root movement launched an online petition against the tourism infrastructure project. Within weeks, the more than 150.000 activists signed the petition. The resulting political pressure forced the project operators to abandon the project. We think that examining the success of this online petition through the concept of 'online publics' (Arvidsson and Caliandro, 2016) can be particularly useful for enhancing our understanding of consumer-activism in digital environments.

Consumer activism has become a key analytical concept within Consumer Culture Theory. The way in which consumers engage in activism has been studied in terms of consumer resistance (Penaloza and Price, 1993; Holt, 2002), anti-brand communities (Hollenbeck and Zinkhan, 2010) and consumer movements (Kozinetz and Handelsmann, 2004). While much emphasis has been placed upon understanding the communitarian aspects of consumer activism (e.g. Kozinetz and Handelmann, 2004, Hollenbeck and Zinkhan, 2010), as yet there has been little attention paid to understand the social formation that activists form in digital mediated environments. This study mobilizes the concept of 'online publics' as a theoretical framework for studying online consumer-activism. Online publics are discursive formations that are characterized by the absence of the communitarian characteristics, such as shared values and identities, and direct interaction (Arvidsson and Caliandro, 2016).

Employing a combination of netnography and discourse analysis, this study investigates why consumers engage in an online petition (www.meinaufstehen.at) against a large-scale tourism infrastructure project. An analysis of the comments posted on the petition website revealed that the activists form an online public that is mediated by a degrowth discourse. The findings suggest that online consumer-activism can be understood as a 'productive public' (Arvidsson and Peiterson, 2016) demanding environmental responsibility of regional economic actors. The study concludes with pointing out differences between online-activism publics and 'brand publics' (Arvidsson and Caliandro, 2016), as well as interpreting the findings in terms of a new 'ethical economy', in which "corporations depend ever more on collaborative peer judgements mediated via social media" (Arvidsson and Peiterson, 2016, p.13).

THEORETICAL BACKGROUND

Consumer activism and online publics

Social relations among consumers can take on different forms and typically differ in the nature of their internal organization. Social forms that have gained widespread recognition within consumer research are consumer tribes (Cova, Kozinets and Shankra, 2007), subcultures of consumption (Schouten and McAlexander, 1995), and brand communities (Muniz and O'Guinn, 2001). These concepts are community oriented and served as a theoretical background for the study of consumer activism, setting the research focus towards understanding the social bounds among activists, in terms of shared values, practices and identities (e.g. Hollenbeck and Zinkhsan, 2012, Kozinets and Handelmann 2004, Hollenbeck and Zinkhsan, 2012). In online environments, associations among consumers, being activists against or admires of a brand, were found to be "less structured and more fleeting and ephemeral", than community oriented concepts would imply (Alvesson and Caliandro, 2016). These publicity-driven forms of online consumer sociality, are characterized by the absence of tight social bounds among its participants, and have been conceptualized as 'online publics' (Alvesson and Caliandro, 2016). In the following, the example of the #metoo debate is used to highlight the peculiarities of online publics.

The #metoo debate represents an ideal typical example of an online public that forms around a social issue. Participants use the social media platform Twitter to share their private experiences and perspectives onto the issue of sexual harassment. The tweets connected through the hashtag #metoo can be understood as a mediated association among strangers that is directed towards the pursuit of a 'common thing' (Arvidsson and Peitersen, 2016). The hashtag #meetoo serves as a mediation device that links the individual contributions into a discursive formation. In contrast to the aforementioned communitarian forms of consumer activism such as anti-brand communities (Hollenbeck and Zinkham, 2006), or consumer movements (Kozinets and Handelman, 2004), the online public around the #metoo hashtag is characterised by the absence of direct communication among its participants. Tweets associated with the #metoo hashtag represent an accumulation of 'private affects' that trigger 'waves of imitations' (Arvidsson and Caliandro, 2016, p.728). A comment on Facebook, a post on Instagram, or a like or a share would be other examples for private affects. However, the individual tweets do not lead to an extensive discussion on the platform, since the majority of participants engages only once or twice in the public. Therefore, online publics represent assemblages of individual perspectives on a common issue, they form "an organized media space kept together by a continuity of practices of mediation that are centred on a mediation device" (Alvesson and Caliandro, 2016). In contrast to the aforementioned community type social formations (Muniz and O'Guinn, 2001; Luedicke, Thompson & Giesler, 2010), online publics are characterized by the absence of community markers such as deliberate interaction, a shared identity, and shared values (Arvidsson and Caliandro, 2016). Rather, an online public represents a temporal, discourse phenomenon that develops around a common theme.

Since online publics are a 'discursive formation' (Arvidsson and Caliandro, 2016), the aim of this research project is to understand the nature and function of discourse in sustaining and directing online publics. This research project is particularly interested in revealing which vocabularies, statements, concepts and ways of reasoning constitute online activism publics. We understand discourse as "a connected set of statements, concepts, terms and expressions which constitutes a way of talking and writing about a particular issue" (Watson, 1994, p.113). In particular, we are interested in examining the relationship between discourse as social text that is produced in the context of an online petition and discourses "in the sense of large-scale ordered, integrated way of reasing/ constituting the social world (Alvesson and Karremann 2000, p. 1125).

METHODOLOGY

This study develops a methodological approach that combines netnography (Kozinetz, 2015; Bartl et. al., 2016) and critical discourse analysis (Fairclough & Wodak, 1997; Cuarana and Cane, 2008). Our primary source of data were comments posted by participants of an online petition (www.meinaufstehen.at). We collected

a sample 492 posts. This data set represented a complete inventory count, when the petition reached 150.000 participants. The low ration between signers of the petition and comments posted is typical for affect-driven online publics (Arvidsson and Caliandro, 2016). After signing the petition via entering the name and confirming the signature via email, participants have the possibility to post a short comment in which they state their rational for signing the petition. Posts are typically one to three sentences long and provide one argument for signing the petition. Secondary data encompassed the monitoring and collection of online media coverage as well as an expert interview with the petition initiator. Data analysis encompassed an iterative process of inductive categorization (Kreiner, Hollensbe, and Sheep 2006; Spiggle 1994) and abstraction to derive major themes related to the petition. In a second step, we approach the data using a discourse analytical framework in order to identify subjects, objects and concepts, and how they relate to each other (Cuarana and Cane, 2008). The two authors coded independently, and reached final consensus and inter-coder reliability in extensive rounds of discussion (Arnold and Fischer 1994; Kreiner et al. 2006).

FINDINGS

This study provides a critical discourse analysis (Fairclough & Wodak, 1997) of comments posted by participants of an online petition against a large-scale infrastructure project. It was found that the participants form an online public that is centred around a degrowth discourse, that questions the endless-growth paradigm of capitalism. In the following we show how the individual posts are connected by a coherent sent of meanings.

Absence of a common opponent

The first discursive process we identified is, that the public is characterised by the *absence of a common opponent*. This finding is stark contrast to Kozinets and Handelman (2004) who state that "Social struggles and social movements must have an adversary against which to fight, if they want to be effective" (p.697). Instead of a common opponent in the form of an individual or a corporate brand, the public refers to an inhuman, powerful and destructive force. The comments ascribe agency to a not further specified 'elite', to 'the people in power', to 'the glacier ski-resort', to 'the Pitztaler', or simply 'the few'. Overall, the enemy is out of sight, unknown and faceless. The comments are characterized by the absence of personal names, the absence of direct capabilities, such as 'CEO', and the absence of specific organizations. E.g., the name of the concerned ski-resorts is more or less absent. If there is an opponent defined, it is seen as a very small group of insiders, an economic elite that is outside of direct touch for the public.

Since there is no direct or human opponent, the public does not criticise the infrastructure project or its proponents directly. Rather,

Table 1: Summary of Findings

THEME	EXAMPLE QUOTES
Absence of a common opponent	Because the madness never ends. Just because some people just can't get their necks full, to sacrifice our nature again and again and again is just unbelievable! This madness simply has to be stopped, where else is it going to lead? Such projects also find imitators very quickly and then???? (Angelica P. 1135) "It is time to stop this insane robbery of nature and to see ourselves as part of this world and not its consumers" (Stephan O. 936) "Pure greed of a few lunatics" (Karlheiz E. 405) Because they are only interested in profit. Not about environmental protection" (Siegfried G.)
Greed and Insanity as suspected causes	"because what is being planned here is simply madness... a crime against nature" (Claudia p. C 57) "Man has only megalomania and has calcified and is only destroying the wonderful nature, it is enough, slowly" (Manuela E. C.65). "This ski slope proliferation is simply madness" (Roswitha p.c.79) This greed for profit pisses me off!! Where is the respect for our beautiful nature! " (Gisela K. C.1140) "Nature conservation/climate protection must be in the foreground and NOT THE greed for even more money at the expense of nature!!!" (Rudolf S.)
Nature as an abstract object of protection	"Because, as an Upper Austrian, the protection of the Alps is also very important to me" (Roland S.) "Our environment needs protection." (Gabriel) "Nature conservation concerns us all" (Elfi T.) "The existing ski areas are sufficient. For the protection of nature"

comments were found to criticise the destruction of landscape, of glaciers, nature and the mountains in general terms. Or, a considerable amount of comments was found to question the endless-growth logic of the tourism industry and of capitalism in general. These findings suggests that the online petition serves as a trigger for a concerned public to collectively express their deep concern regarding the growth logic of capitalism and the perceived end-of growth in alpine tourism infrastructure.

Greed and insanity as suspected causes

One on the most significant pattern in the data was that the public suspected *greed* and *insanity* as the two central causes for the project. Due to the absence of a personified opponent, both drivers should not be misunderstood as character traits. Greed and insanity are seen as two systemic drivers of tourism policy in the region and capitalism in general. Greed and insanity were perhaps the most significant pattern in the data and played a key role in framing the entire discourse. Greed involved the construction of the enemies as being primary concerned with the unlimited accumulation of wealth on the expense of the public, nature and future generations. Terms used to describe greed were *greed, greedy, moneygrubbing, greed for profit, pure greed,* and *greedy entrepreneurs*.

The second key driver was *insanity*. Insanity appeared in various versions ranging from *insane*, to *insanity,* and *megalomania*, to more polemic notion such as *dementia, ludicrous, imbecility, manic* and *idiocy* and *bullshit*. Despite the partly accentuated terms, the statements appeared all in an objective, serious and respectable tone. Polemic, offensive, insulting or below the line comment were more or less non-existent. Since the enemy is an irrational, greedy and insane force, it appears, that the signers construct their subjectivity in opposition to the enemy, as being the rational, responsible and long-term oriented subjects.

Nature as an abstract object of protection

The public was found to be united around nature as the primary object of concern. Nature appeared in a number of abstract manifestations such as *landscape, glacier, mountains, mountain landscape, the Alps, and environment*. However, the majority of the comments sticked the abstract term *nature*. What is crucial for the understanding of the discursive formation is, that nature is seen in the dichotomy of *untouched* or *destroyed.* Hence, nature is seen as an *irretrievable entity* and a *holistic quality*, which is *untouched* and can only exist being untouched from human influences. This holistic understanding of nature leaves no space for the project group to develop other solutions, such as a downscaled project, or compensation activities.

The analysis reveals how the public defines appropriate behavioural patterns. The activists see themselves holding an *appropriate, long-term* and *altruistic* relationship to nature. The initiators are seen to hold a *short-term oriented* relationship to nature that is characterized by *profit-maximization* and *exploitation*.

The differences in terms of time scales were remarkable. The public was found to hold a very *long-term oriented* perspective. They regularly stressed their responsibility for *future generations*. Terms that appeared were *future generations, children* and *grandchildren*. The activists are advocates of the future. Their subjectivity is a manifestation of the *rational, long-term oriented* force. Their relation to nature is *protective* and *conserving*.

DISCUSSION AND CONCLUSIONS

This study finds that online activism represents a social formation that can be described in terms of an online public. The online public around the online petition platform shows many similarities with the original concept of 'brand publics' (Arvidsson and Caliandro, 2016). The posts represent a 'multitude of private perspectives' onto the infrastructure project with the aim of initiating 'waves of imitation'. The platform allows no interaction among the participants; its function is to 'mediate' the continuous flow of 'private perspectives'. The participants create 'publicity value' for the petition initiators. Beside these similarities between brand publics and online-activism publics, our analysis revealed two key differences between online-activism publics and 'brand publics' (Arvidsson and Caliandro, 2016).

First, brand publics are characterised by 'heterogeneous meanings', and the 'absence of collective values' (Arvidsson and Caliandro, 2016). Our case clearly departs from these two markers. The discourse analysis clearly shows how the individual comments share a connected set of meanings. The comments represent a connected set of statements, concepts, terms and expressions, which constitute the way the infrastructure project is seen. Overall, the comments mimic a post-modern degrowth discourse, that questions the endless-growth logic of capitalism. This implies that online publics can indeed share a collective set of values. In our case these values resonate around the protection of nature, and a shared rejection of mass-tourism and questioning the endless-growth logic of capitalism.

Second, we found that, similar to brand publics, the online petition gains publicity value "through harvesting a mass of temporal and small contributions" (Alvesson and Caliandro, 2016). The individual contributions aggregate to a powerful semiotic force (Tsoukas, 1999), a 'productive public' that creates 'reputation value' (Arvidsson and Peiterson, 2016). However, in contrast to brand publics, activists do not derive publicity value through their participation. The platform is serious about the anonymity of the signers; the name does not appear in public. The findings suggest that participants derive 'identity value' through participating in the online petition. Comments were united by a shared post-modern concern regarding the 'endless-growth logic' of capitalism. Signing the petition transforms consumers from concerned citizens into activists (Caruana and Crane, 2008). This does not mean that 'being a petition signer' or 'being an activist' is a major part of individual identity of the signers. Rather signing the petition, is similar to buying a bottle of organic milk, it represents an act of post-modern consumption that provides a valuable identity brick used for 'curating' a singularized consumer subjectivity (Reckwitz, 2020).

Finally, we suggest that this case can be understood as a manifestation of a new 'ethical economy', in which corporations need "to broadening their value horizons", and have to become "more sensitive to online sentiment in their operations" (Arvidsson and Peiterson, 2016, p.13). This new semiotic environment implies that corporations need to understand that "reputation functions as a kind of capital" (p.16), and consequently need to develop means for managing their 'ethical capital' as a strategic resource.

Women Who Watch Porn: Market-Mediated Gendered Discourses and Consumption of Pornography

Maria Carolina Zanette, Neoma Business School, France
Athanasia Daskalopoulou, University of Liverpool, UK

INTRODUCTION

Institutional logics can be described as patterns that shape the social world (Friedland and Alford 1991; Thornton and Ocasio 2008). They provide a 'grammar' (Friedland and Arjaliès 2019) that organizes individual (Friedland et al. 2014) and market-level practices (Ertimur and Coskuner-Balli 2015; Rao, Monin and Durand 2003). Institutional logics influence how individuals consume particular objects (Zanette and Scaraboto 2019a). However, how objects are perceived and consumed can change over time through the agency of market actors, such as consumers (Dolbec and Fischer 2015; Scaraboto and Fischer 2013).

Friedland (2018) argues that the triadic relationship among institutional objects, practices, and the subjects that consume them is what materializes an institutional logic. Specifically, he defines institutional objects as a set of material, emotional, and practical arrangements that translate a logic into everyday practices (Friedland 2018). As a result, through these articulations, consumers are said to inhabit institutions.

Yet, previous literature has not sufficiently explored how consumers inhabit institutions whose institutional objects transmit controversial 'grammars' of practices. In particular, prior studies, with a few exceptions (Zhao and Wry 2016; Zanette and Scaraboto 2019b) have overlooked how institutional logics can be gendered, and how consumers relate to them (Thompson and Üstüner 2015). In this study, we, therefore, explore how consumers engage in the triadic relationship proposed by Friedland (2018). Specifically, we investigate a particularly gendered institutional object that is used by female consumers: pornography.

Pornography acts as a point of knowledge, power, and truth in which sexuality is specified and disciplined (Foucault 1990). It is an object infused with logics of eroticism (McCormack and Wignall 2017), but it has also been contested politically and academically over its role in reproducing patriarchal behaviors and aesthetics (Dworkin 1981; Smith 2007; Neville 2018). Historically, pornography has been created by men for men, and as a result prior studies argue that women tend to prefer other institutional objects such as erotica (Hardy 2001). However, recent research finds that women consume pornography frequently and use it to reach a state of pleasure (e.g. for sexual gratification) (Daskalopoulou and Zanette 2020). With that in mind, we explore how different market-mediated gender discourses affect how women use pornography.

Our contributions to the literature are twofold: first, we respond to past calls in the literature to understand how institutions are inhabited on an individual level (Friedland 2018; Friedland et al. 2014), focusing on the experiences of consumers. Second, we advance the literature in market-mediated gender discourses (Holt and Thompson 2004; Minowa, Maclaran and Stevens 2019; Thompson 1996; Thompson and Üstüner 2015) by enhancing our understanding of how recent feminist and sex-positive discourses impact consumption practices.

MARKET-MEDIATED FEMININITY DISCOURSES AND THE CONTROVERSY AROUND PORN

Marketplace enactments of women's roles in the consumption sphere represent the ways in which consumers understand femininity (Maclaran 2012). Market-mediated gendered discourses are rooted in the cultural production of objects (Scaraboto and Zanette 2020; Zanette and Scaraboto 2019b), advertising (Minowa et al. 2019; Pirani, Cappellini and Harman 2018), popular mass media and social media (Maclaran 2015; Zanette and Brito 2019). These discourses produce models (Holt and Thompson 2004) or 'grammars' that might affect how consumers engage with a particular institutional object. We describe two market-mediated gendered discourses relevant to pornography consumption and female sexuality: consciousness of the 'negative effects paradigm' (NEP) of pornography and sex-positivity.

We use McCormack and Wignall's (2017) NEP terminology to refer to a pool of criticisms that highlight negative attitudinal and behavioral consequences of pornography. Under NEP, anti-porn feminists have claimed that pornography as a genre and as an industry promotes female oppression and sexual aggressiveness towards women (Dworkin 1981; MacKinnon 1993). The anti-porn rhetoric was popularized during the so-called 'sex-wars' - public and publicized debates that took place in the United States in the '70s and early '80s (Ciclitira 2004). Such criticisms have lost prominence in contemporary debates over porn and a plethora of studies have called for more research on the role of pornography on sexual identity and sexual practices beyond NEP (Attwood 2002; Comella and Tarrant 2015).

However, the production of cultural materials such as the documentary 'Hot Girls Wanted' or the emergence of fan-based, alternative forms of producing erotic materials for women (Neville 2018) indicate a revival of the debate around the consequences of pornography. This revival occurs at a time when political consciousness and (online) activism characterize what has been recently called feminism's fourth wave. According to Maclaran (2015) feminism is having a 'come-back' in popular culture in a mostly social media-based form of engagement that sustains a dubious relationship with commercial and marketing symbols. Examples of fourth wave feminism range from a renewed understanding of controversial markets as empowering for women, such as pole-dancing and sex toy shopping (Maclaran 2015) to grassroots feminist organizing such as the #freethenipple campaign that addresses the sexualization and censorship of women's breasts (Matich, Ashman and Parsons 2018). Women's engagement in social-media activities that highlight the treatment of women's bodies and sexuality by misogynistic mechanisms of patriarchal reinforcement (Manne 2018) has fostered a new activist-consciousness about NEP – not necessarily associating pornography with violence towards women, but still raising awareness about its consequences.

A second discourse relevant to porn consumption is sex-positivity. In the past decades, sexuality has emerged as an important factor defining the 'new femininity' of the end of the 20th century (Glick 2000). As the focus of feminist movements moved from the collective struggle for political and economic rights in the public sphere to identity-related themes such as gender, race, and the body (Bordo 2004; Butler 1990; Crenshaw 1989), women's relationships with their bodies also became a site of gender politics. In this sense, under the umbrella of identity politics, sex-positivity emerged as a type of empowered eroticism (Attwood 2007; Glick 2000), whose discourse affirms that openness about one's bodily pleasures and sexual practices is empowering per se. This discourse of femininity

has been picked up by marketers and translated into the 'girl power' figure (Munford and Roberts 2014), of which Carrie Bradshaw is an example. It also opened avenues for other types of cultural production targeted at women, such as explicit magazines (Smith 2007) and sex toys (Piha et al. 2018; Walther and Schouten 2016; Wilner and Dinnin Huff 2017).

Despite the popularity of sex-positivity, porn consumption can be a source of contradictory feelings for women (Daskalopoulou and Zanette 2020), especially for those who consider themselves feminists (Ciclitira 2004). As women understand that some aspects of the genre are problematic, they often employ strategies to negotiate complex feelings about porn (Ashton, McDonald and Kirkman 2018; Chadwick et al. 2018). For example, in order to cope with these contradictions many women choose to consume feminist pornography, which is committed to intersectional feminism politically and aesthetically (Taormino 2013). However, we still lack a detailed account of how the 'negative effects paradigm' (NEP) of pornography and sex-positivity discourses influence the relationship with the institutional object of porn.

METHOD

We conducted 27 in-depth interviews (Denzin 2001) with women, aged between 20 and 48 years old (mean age 29), with both exclusive and non-exclusive sexual orientations. We used purposeful and snowballing sampling (Patton 2002) to select women who both consumed pornography and were willing to share their experiences with us. The semi-structured (McCracken 1988) interviews lasted up to 78 minutes, with the average interview lasting 50 minutes. Our analysis followed an interpretivist, modified grounded theory approach (Charmaz 2014). Both authors analyzed the interview data: initially, the interview transcripts were coded independently, and then emerging codes were discussed and developed conjointly.

FINDINGS

Our findings (summarized in table 1) are structured around exemplary cases and portray how the two different market-mediated gender discourses affect the consumption of pornography.

Detaching pornography from gendered discourses: Cecilia and porn as pleasure

The exemplary case of Cecilia illustrates consumers whose relationship with pornography is not influenced by gendered discourses. Her relationship with pornography reflects her interest in *her* pleasure, education, and sexuality.

Her practices of watching pornography derive from curiosity about her pleasure, focusing on her expectations and sexual enactments. In that sense, her usage of pornography relates considerably with what McCormack and Wignall (2017) have described for male consumption of pornography: an exploration of desire and fantasy.

Nevertheless, she has had contact with materials that criticize the porn industry. She acknowledges, for example, a documentary she watched on Netflix dealing with certain stories and abuses that have happened in the porn industry. However, when she engages critically with pornography, her comments tend to revolve around her identification with the material and her personal taste. As such, her consumption is individualized, and she does not contest the object per se or the industry that produces it. Ellie exemplifies an entirely different case, which is analyzed below.

Further de-legitimizing porn: Ellie and porn as oppression

Unlike Cecilia, Ellie's relationship with pornography has been fraught with different conflicts, leading to a different form of engagement with the institutional object, which is repurposed, or directly rejected.

Ellie, in her personal experiences, started reflecting upon and being more critical of the consumption of pornography due to a past relationship whose sexual acts were similar to what she understands as 'porn'. For Ellie pornography is sex depicted without a 'human' (emic term) representation.

Furthermore, she considers herself someone who has invested a lot of time reading about pornography, and she points its harmful effects as a means of sexual education, reproducing sexist values in how people act out their sexuality. As a consequence, she has disengaged from pornography and engaged with a different institutional object connected to her sexuality: erotica. In her view, erotica is defined not by the explicitness of the genre, but by the contact and humanization of the sexual relationship it depicts.

Repurposing porn: Peppa and porn as empowerment

Peppa shows a high level of engagement with the sex-positivity discourse. For her, watching pornography, masturbating, and talking openly about pornography, especially in front of the opposite sex, is in itself an empowering act.

When prompted about the role of pornography in her life, Peppa, like Cecilia, described how pornography helped her understand the different aspects of her sexuality that she could enjoy. She explains how pornography has enabled her to be confident in her sexual interactions. For her, pornography, by depicting sex not necessarily partnered with emotional engagement, helps her to see an alternative conceptualization of sex as pure pleasure.

According to the type of pornography she watches, we found that the dialogues Peppa sustains with her friends – especially from the opposite sex – help her to normalize what Ellie and Cecilia view as violent or submissive practices. By looking at the object through a sex-positivity lens, and discussing her views with different people, what could be considered harmful, oppressive, or submissive becomes acceptable as a form of fantasy.

Changing porn: Valerie and feminist porn

Finally, our last exemplary interviewee is Valerie, who openly advocates changes concerning the institutional object. Like Peppa, Valerie likes to talk about pornography with her friends, even to exchange materials. However, she currently considers it problematic. The fact that it is male dominated, as she and the other interviewees refer to it, makes her 'confused' about the fact that women also tend to like pornography.

However, instead of giving up on watching pornography, Valerie's solution was to subscribe to a different type of pornography made by women for women. She says that this type of pornography deals with issues such as the wellbeing of actors, consent, and protection, which erases her concerns about 'disturbing' materials. She mentions, for example, that she is interested in the process of mediation between the actors before shooting different scenes, regardless of the types of sexual practices that are depicted. In that sense, the sexual practice depicted in the video itself, for her, qualifies as fantasy. Once there are mechanisms that inhibit exploitation, different kinks can be viewed positively and not as mechanisms that foster the oppression and exploitation of women.

DISCUSSION AND CONCLUSIONS

Our work departs from the idea that consumers inhabit institutions differently depending on their interaction with market-mediated gendered discourses (Holt and Thompson 2004; Thompson and Üstüner 2015) when confronted with an institutional object infused

TABLE 1

How consumers interact with the institutional object	Consumer	Engagement with market-mediated gendered discourses	Excerpt
Detaching pornography from gendered discourses: consumers in this case interact with pornography searching for pleasure, leisure, and sexual education. Gendered discourses are acknowledged, but do not affect the consumer's relationship with it	Cecilia	Low level of engagement with both discourses	*"Then I started watching bizarre things, because I was curious. I said: Hey! It's a lot of things... when you think you do crazy things; you see that there are completely different things. But I also remember ... what did I start to see? I remember that once I saw... I wanted to watch amateur videos to see the time women take to come, because I had doubts about that. Because [...] I had relationships that I think I never had an orgasm during penetration, and I was: 'Hey! It's not possible, how does it work ... what do they do?'"*.
Further de-legitimizing porn: consumers avoid interacting with the object, rejecting its patriarchal nature. For these consumers, pornography as an institutional object is infused with aggression towards women, lack of affection, and misrepresents "real" sexual relations	Ellie	Low level of engagement with sex-positivity and high level of engagement with consciousness of NEP	*"[In porn, sex] is an object who plays a role and that's it, but I think the problem is that when you watch that kind of content you are not aware that in some way, on some level, something is influencing you ... because you're starting to see sex just in that sense ... as porn, not sex that usually people are having in their houses, which is not me with two big boobs, screaming or I don't know. That's the difference. And you want probably the kind of beautiful man with a big cock that you see in the movie, with marvelous gestures that make you scream. I think this is the difference, because it's so different from reality and the issue of submission for me is pretty important today."*
Repurposing porn: consumers who repurpose porn use the intimate nature of the object to openly talk about sex and position themselves through porn as women who are engaged in sex-positive practices. Openly watching pornography, in this case, becomes a statement of empowerment.	Peppa	High level of engagement with sex positivity and low level of engagement with consciousness of NEP	*"I think, I found speaking to people about it, if it comes up in silly conversations when you've had a couple of drinks and people talk about it, or people make a joke about it."*
Changing porn: consumers support new initiatives by different institutional actors who try to change the porn industry to overcome the patriarchal nature of the institutional object, such as subscribing to websites of feminist porn directors.	Valerie	High level of engagement with both discourses	*"I was making a subscription for Erica Lust's website. I enjoy her and, it's the first name that comes across when you look for alternative porn, or maybe called feminist porn. So, I was mostly looking through websites that speak about this subject, and then looking for the names that pop up... so Erica Lust, because she as well has guests as directors, so there's a wide variety of things, rather than just one style or one kink... and I came to the conclusion that I pay for many different things and porn is something I enjoy, so I could throw some 9$ a month to access a product that I know I will enjoy... not all the shots, but generally it's nice and there are interviews with the actors, and they're gonna get paid at the end of the day, it's their job, it's entertainment, and yes, I would rather consume that kind of product than some random clips that I don't know where they've been shot. Another thing that I find problematic for me is that it's impossible to know who these people are, unless they are professionals, there's normally no information available because there's lots of exploitation, I don't feel really comfortable watching clips of someone who has been exploited, and if I have no way of knowing"*.

with patriarchal logics (Zhao and Wry 2016). As the object itself does not provide a 'grammar' of practices for consumers, they engage in different strategies to learn how to use it. As such, the subject-practices-institutional objects triad provokes different forms of engagement with the object (Friedland, 2018): ignoring the market-mediated discourses, rejecting the usage of the institutional object, repurposing the object, or engaging with new objects that defy the patriarchal logics.

We also found that due to NEP consumers associate the plots and aesthetics of porn with industry scandals and societal consequences. Interviewees mainly focused on how women in pornography look oppressed or appear to be 'suffering' during sexual acts. Both NEP and sex-positivity discourses promote contradictory messages about pornography. On the one hand, activist-consciousness still spreads the idea that pornography fosters violence towards women (Dworkin 1981), for example we found this on Ellie's understanding. On the other hand, sex-positive discourses (Glick 2000; Walther and Schouten 2016) encourage women to understand their sexuality – sexual fantasies, kinks, and self-pleasure – as something that is empowering. Pornography has its place within this discourse as a tool for self-discovery and sexual education, if not as a resistant performativity of female sexuality. As our findings show, these contradictions affect the 'grammar' of practices with which women use pornography, producing different conflicts, emotions and coping mechanisms to justify using porn.

Our informants have expressed different preferences about pornography, ranging from more 'soft' or romantic videos to specific 'kinks'. Pornography, as an institutional object that is mostly framed for a male audience, does not provide a 'script' for solving the conflict between the apparent (and sometimes real) exploitation of actors and the pleasure derived by engaging with fantasies and kinks. As such, even though women may use it for their sexual desire and education (Attwood et al. 2018), pornography, with its confusing 'grammar' of practices, becomes a blurry, ambivalent object with which women interact for pleasure. However, as Rao et al. (2003) have shown, when activism enters the subject-institutional objects-practices triad, it can foster changes to a particular institutional object, creating, in turn, further changes in the institutional logics of a field. Our findings show that as market-mediated gendered discourses foster conversations around porn consumption, new forms of portraying and enacting sex and sexuality might gain space to emerge.

Beyond the Westernized Body: Constructing the Ideal Female Body Through Paradoxical Paradigms

Hela Zouaoui, Université de Tunis, Tunisia
Fatma Smaoui, Université de Tunis, Tunisia
Russell W. Belk, York University, Toronto, Canada

INTRODUCTION

Beauty has been recognized as a site of struggle over gender, race, social class and body. Formed, recycled and reproduced through the narratives and images of the body, the portrayed female imaginary is influenced by a number of social values and stereotypes (Salesses and Romain 2014). This is especially true in a contemporary economy characterized by a global capitalism. Here we find beauty hierarchies intertwined with ethnic and class inequalities.

Although the first decades of the 21st century have been proved a time of paradoxes (Jha 2007, 2015), contemporary society is still characterized by an aesthetic canon of female corporeity that has long propagated Euro-American norms and ideologies of sexuality, thinness and leanness discourses (Ponterotto 2016). These norms have largely triumphed over cultural ideologies with different ancestral beauty ideas (Banet-Weiser 1999). New consumer dynamics have challenged the promoted female body depicted as "only thin" (Scaraboto and Fischer 2013; Zanette and Brito 2018) and opened room for a more inclusive and multi-cultural model of the female body. The binary body imaginary translating ideal/rejected encoding distinctions into thin/large weight conditions is thus replaced by a "hybrid" socially and culturally constructed imaginary that broadens the channel of negotiations between more than two (opposite) entities (Bhabha 1994).

Today, transnational consumer culture seems to increasingly question the conventional body imaginary once again (Salesses and Romain 2014), from outside of the Western sphere. The myth of Westernized beauty is being challenged as not wholly oppressive once recontextualized in a particular culture (Wilk 1995). Several Latin American and African studies have contested the Euro-American norm of thinness with a preference for curvier bodies (Viladrich et al., 2009; Toselli, Natascia and Emanuela 2016). This research examines the subjectivity of constructing an ideal body in non-western contexts. In the Tunisian cultural context where traditional conservative Islamic and neoliberal liberated Western lifestyles co-exist (Hirschman and Touzani 2011), beauty ideals involve a combination of both Western and Eastern attributes (Feki et al., 2018). We join the growing conversation that acknowledges the co-existence of contradictory body ideals challenging the Euro-American paradigm and championing curvier body types (Viladrichet al., 2009; Serrano-Barquín and Serrano-Barquín 2016).

CONCEPTUAL FRAMEWORK

The body is both material and symbolic. It has been idealized and stylized since ancient times. In the late nineteenth century, a curvaceous large sized female body was favored and depicted as an indicator of fertility, desirability and sexuality (Almond 2015). Moreover, it was considered as a sign of health, endurance, wealth and a reflection of a higher social position (Brown and Konner 1987; Vigarello 2013). However, new interpretations of beauty, aesthetics and shapes occur over time as a result of complex interactions between symbolic and social imaginaries. Contemporary dominant social and cultural imaginaries reject the ancestral idea of voluptuous body as an ideal and replace it with a white, thin and heterosexual subject for females. As for males, ideal bodies were always imagined as "hunky": muscled ones testifying of male power, strength and superiority (Caldas-Coulthard and Moon 2010). Resulting inequalities have generated counter-ideologies (Scaraboto and Fischer 2013). By promoting a single dominant ideal female body, perceptions and descriptions of corporelity consider thinness as a normative condition and non-thinness as a deficit, drawing heavily on health discourses (Zanette and Brito 2018). Women became thus obliged to regulate their bodies accordingly.One result is a process of rationalized management interweaving individual self-control and several social constraints (Featherstone, 2016; Scaraboto and Fischer 2013).

The promoted canonical female body depicted as young, fit, unwrinkled, and especially thin is however very far from the natural human body whose genetic variety leads to different corporal forms. Moreover, it ignores the inevitable changes occurring across the life cycle as the body becomes older, lumpier, saggier, and more wrinkled (Ponterotto 2016). With the absence of representative body ideals for plump oversized women with other different shapes face negative consequences (Swami et al., 2012). New consumer dynamics to empower marginalized women and reposition them as active agents seek to make room for a more inclusive and multi-cultural beauty and body ideal (Zanette and Brito 2018). As a resistive reaction, plus size consumers have challenged the aesthetic canon of female corporeity with its dominant discourse of leanness (Ponterotto 2016). It seeks to create room for a "beauty in all size" model celebrating curves for females worldwide. Recently health and fitness ideologies have sought to supplant beauty as the ultimate goal of body management (Rashid 2019). The contemporary body project is depicted as the "the athletic ideal" characterized at the same time with low body fat and thin waistlines, along with abdominal muscles and well-rounded curves (Ferguson et al., 2020). This ideal is carefully crafted and constructed through consumption practices of healthiness, fitness, dieting and sports (Viotto, Zanette and Brito 2020).

The myth of Westernized body imaginary is also challenged culturally (Bhabha 1994). Research on beauty contests suggests a preference for curvier body types (Viladrichet al., 2009). In sub-Saharan Africa, such bodies are seen as a sign of female beauty and fertility (Mokhtar et al., 2001). Fuller bodies are also linked to prosperity and wealth since only those with greater economic capital can afford to eat and gain weight (Bush et al., 2001). Cultural acculturation and enculturation have a strong effect on weight status and perceptions of body size (Toselli et al., 2016). Since slimness is a Western ideal, the fear of fatness is believed is more likely among those with greater exposure to Western culture (Soh et al., 2008). Thinness aspirations also relate to modernity aspirations, but only when modernity is equated with Westerness (Gaonkar 2001).

In Tunisia, the beauty model swings between Western and Eastern ideals (Feki et al., 2018; Khalaf and Gagnon 2014). Traditional fattening techniques aim to achieve the traditional aesthetic ideal of dramatic weight gain and a corpulent body (Salamon and Juhasz 2011), while transformative processes promoting a Western ideal of thinness (Tlili et al., 2008) through dieting and sports practices backed by the healthiness and leanness discourses (Zanette and Brito 2018). The bodily imaginary has become an arena of conscious design, molded and altered by the power discourses contesting. Thus our research question is how this battle of paradoxical paradigms for the female body unfolds in the Tunisian context.

METHODOLOGY

This paper presents the preliminary results of an ongoing research project investigating the evolving ideal body imaginary as reproduced and recycled at individual, social and global levels. We conducted qualitative research relying on in-depth interviews with Tunisians of varying gender, age, previous/current body size and attitudes toward various body shapes. As the body is still considered a taboo subject in the Tunisian cultural context, we relied on open-ended questions and projective techniques. We collected data in Tunisian dialect, Arabic, French and English to make sure interviewees were at ease. Most interviews were audio recorded and transcribed and notes were also taken.

Because we are investigating the current ideal body shape, we relied on visual methods to collect our data as well. Interviews used associative methods (describing the shape through associating it with a particular image/celebrity) and respondent-generated visual data (Prosser and Loxley 2008) through sketching and drawings of the ideal/curvy body shapes. Because some participants feared having poor sketching skills, we sometimes used photographs and shape scales from previous academic works (Viladrich et al., 2009) to help identify the ideal shape. We used an integrated approach involving both visual and word-based data. These research methods helped us to explore the multiplicity and complexity of ideal female body shapes.

Data was collected, analyzed and interpreted following an abductive approach. This involved combined work over two years of back and forth between literature and the field. Besides focusing on idealized female body shape, we investigated the process of constructing personal as well as social ideals and perceptions of global differences.

FINDINGS & DISCUSSION

Our findings (see table1) demonstrate that constructing the female body imaginary displays a multilayered complexity. Identifying the female body ideal was challenging given the subjectivity of beauty and bodily ideals. Although there was no consensus in terms of body size, participants agree about several characteristics when it comes to body shape. Both females and males reject and stigmatize the extreme figures of thin/large bodies and attribute negative connotations to them (see figure 1). The more a "normal" size is approached, the more words became descriptive, neutral and positive. All participants agree that the ideal female shape should be curvy, and that this ideal is more about having "generous curves" emphasized by a tight skin regardless of the related size. An ideal (curvy) female body shape should highlight femininity and sexuality and could swing between both thin/large sized shapes within the bounds of a scope (see Figure). Although most male participants link having curves to sexuality, and sexuality to ideal body image, shapes that float within the scope identified are constructed differently by women. Females with extreme figures -being either too thin and too fat – were extremely uncomfortable with their body image and aspired to have curves through specific body parts and engage in dieting and exercising techniques with these goals in mind.

The ideal female body is considered to be "curvy"; however, this brings many controversies into the conversation about body imaginary. The paradoxical simultaneous presence of global corporal ideals and the curvy shape challenges the binary nature of perceptions of female bodies and broadens the conversation around constructing ideal body imaginary as an evolving and dynamic concept (Serrano-Barquín and Serrano-Barquín 2016).

Curves are thus seen as a site of unification displaying two different (paradoxical) kinds of femininity and beauty, a contest and negotiation between local and global body imaginary discourses. Having curves evokes and reinforces the cultural pride of the voluptuous and sexy (Viladrich et al., 2009). At the same time, it invokes a cosmopolitan vision of Tunisian femininity that adheres to global beauty standards of sexuality, leanness and youth. Thus, the cultural dialogue surrounding the ideal female body involves a set of ambivalences: firm but shapely, fit but sexy, strong but lean, with the size floating over the scope of curvy (see figure). These are not either/or binaries, but rather this **and** that complementarities.

Since curves are desired by men (mostly) and sought by women, a curvy shape can be seen as a metaphor for the Tunisian traditional bodily ideal. Tunisian women are expected to attain or approximate this body imaginary by molding, sculpturing, manipulating, and reshaping their bodies according to these culturally validated norms. This curvy shape is obtained through transformative processes and techniques (Featherstone 2016) such as dieting and (more recently) sports (Ferguson et al., 2020; Viotto, Zanette and Brito 2020). Participants adhere to leanness discourses and buy into the cult of fitness as control agents of their body size. Rejecting and stigmatizing extreme figures of both thinness and obesity is a proof that the construction of body imaginary is still disciplined by Westernized discourses of healthiness, leanness and thinness (Tlili et al., 2008; Toselli et al., 2016) and translating modernity and civilization aspirations (Bhogal-Nair and Lindridge 2017; Touzani, Hirshman and Smaoui 2016).

CONCLUSION

Constructing a contemporary version of the idealized female body is a controversial process surrounded by ambiguities, paradoxes and challenges. Depicted as a relatively healthy, feminine figure with an exaggerated emphasis on curves and sexuality, the ideal female body is found here to be a fashionable and aesthetic project constructed by active transformative processes and techniques involving power discourses. As these discourses are dynamic, subjective,

---

Table1. Findings

Findings
- The ideal female body is "curvy" (in Tunisia): No consensus in terms of size (both relatively thin/large), consensus in terms of shape: generous curves, tight waist line, athletic and sexy.
- Extreme figures of both thinness and fatness are rejected and stigmatized.
- "Curves" unify paradoxes and controversies in constructing the ideal female body: the thin westernized ideal along with the ancestral voluptuous.
- Challenging **and** adhering to the dominant Euro-American thin ideal.
- The ideal body is constructed through paradoxical paradigms → Body imaginary is an evolving and dynamic concept.
- Constructing this paradoxical ideal is done at the individual, the social and the global levels.
Figure 1. Unraveling the complexity of size: shapes of curvy

continuous, contextual and producers of tensions, the contemporary ideal body image is the result of paradoxical paradigms' interactions unified under "curves." Having curves and a curvy shape denotes beauty and delicacy, sexuality, fitness and athleticism. To conclude, the body imaginary can be analyzed and constructed as a dynamic evolving concept that has paradoxical meanings and works at many levels. On an individual level, narratives of the interviewees position the body as a site for subjective ambivalent tensions leading to a (dis)identification process. Placed within a broader social context, its narratives are transformed into a negotiation site involving femininity, sexuality and youth. On a national/global level, ideal female bodies are constructed as a dialogue between dominant modern Euro-American standards of thinness and sexuality, and traditional ancestral ideal of curvaceous bodies.

Our work contributes in studying the ideal body's construction as dynamic, acknowledging that body images are not static, leading to the birth of new body imaginaries (Gatens 1996; Serrano-Barquín and Serrano-Barquín 2016). We therefore study how these paradoxical paradigms interact to reproduce and construct body images. Our contribution to investigating the body imaginary outside of the abundant Western literature, in a non-Western cultural context, is also registered. Furthermore, through the understanding of the contemporary bodily ideal, the findings may be very beneficial to those who eager to understand body-centered marketplace interactions through consumption experiences aiming to construct the ideal (female) body such as fitness and gym industries. Future researches investigating the process of constructing the body imaginary in a consumer-fitness context are called for.

Comment: Integrating this scale as a further step of the visual investigation also meant that we ask participants about their descriptions and perceptions of the presented figures. Coherently with the results, we found that extreme figures of thinness/fatness are rejected (e.g., Figure A/B and H/I). The shapes floating around the scope of curvy (namely Figures D, E and F) were mainly perceived as attractive by most participants, or at the very least, acceptable. Figures G and H were proposed as attractive/ideal by men fat fetishists while fattists proposed figure D as the ideal female shape.

Competitive Papers—Extended Abstracts

Sinnfluencers and A Collective Moral Identity

Ai Ming Chow, University of Melbourne, Australia

EXTENDED ABSTRACT

Ethical consumerism has been on the rise in North America (Thompson and Coskuner-Balli 2007). Increasingly, consumers are concerned with the consequences of their consumption behavior (see Cherrier 2009). They are also holding companies accountable for negative and transgressive practices through boycotts (Kozinets and Handelman 2004), anti-consumption and consumer activism (Glickman 2009). These concerned citizens limit their day-to-day consumption practices in more than one ways. These practices include consumption of alterative green products, cutting or eliminating meat from their diets, taking shorter showers, not owning a car, and boycotting unethical businesses. This minimalization is driven by a social imaginary of a doomed planet, if current consumption practice remains the same (Harveston 2018).

To mimic their consumers, companies are struggling to forge ethical products and ethically conduct business. Studies have looked into the motivation of these ethical consumers (Newholm and Shaw 2007) and their influence on market dynamics (Beard 2008; Nicholls and Opal 2005). The focus of these papers mainly emphasized the role of collective action in driving consumer movements, yet overshadowing the role of the individual such as social media influencers in creating a sustainable future.

Parallel to the rise of ethical consumerism is the increasing use of social media in affecting consumer behavior (Brown and Hayes 2008). For example, Hughes, Swaminathan, and Brooks (2019) shed light on how online social influencers affect and facilitate online brand engagement. Within the marketing literature, Kozinets et al. (2010) unpacked the evolution of consumers' influence on consumption in the context of online communications such as online blogs. According to Kozinets et al. (2010, p. 74), social media influencers and their role in influencing the consumption of their followers have been identified to be "a part of a complex cultural process". Their studies revealed that communal interests shape consumers' motivations to communicate marketing messages to other consumers. Specifically, they explained how successful social media influencers engage in practices that transform marketing-related information to communally desirable and palatable social information.

However, while Kozinets et al. (2010) identified the communication strategies by focusing on influential consumers who are part of a "seeded" marketing campaign executed by firms to endorse certain products, it raises additional unexplored questions about the practices and roles of influencers who are individual advocates. Particularly, these influential individuals might even rally other consumers to boycott certain brands, organisations and consumptions practices. Therefore, this study asks: how do these individual influential consumers shape the consumption practices of other consumers? To be more precise, how do they influence the anti-consumption practices and sustainable practices of other consumers?

To answer these questions, we utilize practice theory. Practices routinized behaviors (Reckwitz 2002) that operate at two levels: the social level entails practices as an entity, and the individual level entails practices as performativity (Shove, Pantzar, and Watson 2012; Thomas and Epp 2019). The individual performance of the practice is guided by the social dimension to ensure its conformity to the social expectations (Shove and Pantzar 2005). It is through the continuous performance of a specific practice that it becomes embodied and routinized (Shove et al. 2012). Practices have three main components which are rules to regulate performance, understandings of how to behave and a teleology of the end goal of this performativity (Arsel and Bean 2013; Maciel and Wallendorf 2017; Schatzki 1996).

To answer our research questions, we focus on social media influencers and their approach in building their identity and a collective identity through their followers to stand against practices that they consider to be wrong or immoral. We label these moral influencers as "sinnfluencers" as in *sin*-influencer (Gross 2019). Sinnfluencers' mission is to influence public opinion to consume morally by considering the consequences of their consumption on others. Our sinnfluencers are vegans, ethical fashion designers, or environmentalists. They have self-identified on their profiles as belonging to one of these groups. Our paper utilizes archival data (e.g., newspaper articles, blogs, lectures, and books on and by the influencers and their respective movements) and netnographic analysis of key sinnfluencers' feed posts. We used these multiple online sources to cross-reference the prominence of the various influencers, the number of their followers, the frequency of their posts and their interactions with their communities. We identified top influencers who met the selection criteria. Then, using *Apify*, we downloaded publicly available data on Instagram.

Our analysis reveals that sinnfluencers are individuals who changed their consumption practices to adhere to a different morality. After successful habituation of the change in their practices, they decide to build an online platform to advocate for the same types of change among broader groups of individuals, their followers. The social practice of interest among these sinnfluencers is activism and behavior change. We investigate the entangled web of practice performativity to build their identity and mobilize the collective. Through our data analysis, we identified five performance strategies framing, validating, evangelizing, celebrating and advocating.

Framing refers to directing the blame and the negative emotions toward a specific villain to request behavior change. Validating takes place as sinnfluencers provide proof to support the requested behavior change. Third, they evangelize by building rapport with their followers. Forth, they celebrate the good news about their positive consequences of their modified practices. Finally, they advocate direct behavior change after establishing strong relations with their followers.

Our paper extends the literature on new social movements, by introducing the role of individual players in supporting a social movement. Our findings also add to the literature on individual and collective identity by showing their interplay in a contemporary research avenue of sustainable consumption. Finally, we extend theories of practice to show the relation between the social level practice (i.e., activism) and the different related strategies in its performativity.

Building a Bridge: How Immigrant Parents Strategically Build Dual-Habitus for their Children

Aya Aboelenien, HEC Montréal, Canada
Zeynep Arsel, Concordia University, Canada

EXTENDED ABSTRACT

Acculturation literature has discussed the identity projects of mature immigrants to navigate a new territory. Immigrants adopt one of four identity projects: separation, assimilation, integration, and marginalization (Berry 1992; Üstüner and Holt 2007). However, the acculturation of kids through family-led socialization and the resulting habitus of dual culture kids is not sufficiently covered in the literature. Our paper shows how immigrant parents engage in practices that cultivate a second-generation habitus.

We analyze our data through the lens of habitus (Bourdieu 1984) and practice theory (Hui, Schatzki, and Shove 2017; Schatzki 2001, 2002). Habitus is the enduring and subconscious patterns of thinking embodied since childhood (Bourdieu 1984). It operates through three main sources of capital: cultural, social, and economic. This capital is acquired during early socialization and equips individuals to operate according to a specific schema in their adult life. Habitus guides the performances of practices. Practices are a routinized behaviors (Reckwitz 2002) that are learned and shared with others (Shove, Pantzar, and Watson 2012). It is through the continuous performance of practice that it becomes embodied and routinized (Shove et al. 2012), eventually becoming part of the habitus. Each practice is governed by a teleology or an end goal that governs its practitioners' performativity. Practitioners of a specific practice become carriers through protecting their temporal and spatial performativity (Shove et al. 2012).

Mature individuals leverage their capital to draw distinction in social life (Bourdieu 1984; Lamont and Molnár 2002; Maciel and Wallendorf 2017; Saatcioglu and Ozanne 2013; Sherman 2018). Rather than treating habitus as a preexisting disposition, as in most literature, we take a step backward and investigate the parental practices that shape building the habitus of kids. Consequently, we distinguish between taste and moral practices and how parental socializing concurrently builds these two interrelated dimensions and how they are transferred in intergenerational situations.

We conduct our research in the context of immigrant families in Canada. We interviewed immigrant parents with at least one child. The interviews follow the convention of depth interviews in CCT research (Arsel 2017). Following the first interview, we asked the parents to keep a diary to reflect on some of their parenting techniques. Later, we re-interviewed them to hear their reflection on the diary, how they envision their kids, and what they do to achieve this vision. We also conducted ethnographic interviews with other immigrant parents during family activities and communal events. Finally, we collected archival data (e.g., books, blogs) to understand the resources parents build on to raise the kids.

Immigrant parents demonstrate a strong responsibility and agency in socializing their kids. Our findings demonstrate that parents build a hybrid identity project for their kids through the strategic adoption of practices through four teleological orientations: rooting, synthesizing, discovering, and incorporating. From their perspective, the kids' new lives need to integrate elements of their home countries. Having a second culture is seen as a resource for kids and a source of capital. Their parenting practices deploy elements of both cultures. Parents eventually want the kids to associate both with their home country identity (i.e., Chinese, Russian) and a Canadian one.

Our participants accumulated high to mid-level capital in their home countries that enable them to gather resources for acculturating their kids, consciously thinking about which resources are best for them, and making strategic choices in family practices. These strategies shape practice teleologies and the choices for the main carrier of the practice and the practitioners involved. The main carrier of the practice is the person designated by the family to transmit the focal practice to the kids; in our context, it can either be the parents or a reference group. Involved practitioner refers to the presence or absence of the parents in kids' new practices.

Practices adopted through a *rooting* teleology immerse the kids in activities from their home country. Examples involve cooking authentic food and learning the history of their native country. These practices ensure that the kids have sufficient cultural capital for their trips back home and to provide a sense of identity. Having a sense of identity is a moral position that immigrant parents care about. Parents are highly knowledgeable about these practices and they transfer them with ease. Thus, these activities also foster a sense of unity for the family.

Practices adopted for *synthesizing* include home country activities that kids participate in, however, parents do not possess enough expertise to pass it on. An entrusted practitioner becomes the main carrier. Parents here rely on communal support of home country immigrants to provide them with a recommendation for the best carriers. Enrolling the kids in cultural dance and language classes is a synthesizing practice. These synthesizing practices ensure that the kids have roots and enable a communal network of families with similar habitus.

Practices adopted to *incorporate* allow parents to register kids in host country experiences to better shape their life in Canada without them participating in it. Sending them to mainstream schools, putting them in hockey and skating trainings are examples of incorporating strategies. As parents do not have expertise in these activities and sometimes do not see a value nor have the time to learn them, they delegate the activities to an entrusted practitioner to ensure their kids' perform host culture practices appropriately.

Finally, *discovering* practices involve activities that allow the kids in cultivating a host culture experience. While the parents are themselves not carriers of the practice, they believe it is important for them to learn it themselves to facilitate their kids' performativities. Although the parents are not experts, they trust their ability to acquire enough skills to teach their kids. Watching hockey matches together is one example.

Our paper advances acculturation literature by demonstrating the parenting strategies involved in hybrid acculturation projects for kids. We show the strategies for building a dual culture habitus when both cultures are seen equally important for success in later life. Finally, we add to work on theories of practice by highlighting how practice teleologies are strategically deployed for adopting new practices.

How Variety Influences Predicted Goal Conflict

Luis Abreu, Duke University, USA
Sarah A. Memmi, Duke University, USA
Jordan Etkin, Duke University, USA

EXTENDED ABSTRACT

While pursuing important everyday goals—a successful career, a healthy lifestyle, strong interpersonal relationships, or other personal pursuits—consumers often experience conflicts that may interfere with goal achievement (e.g., missing a workout when a meeting runs late or when an accident causes extra traffic on the way to the gym; Cavallo and Fitzsimons 2012; Etkin, Evangelidis, and Aaker 2015; Fishbach and Ferguson 2007). When consumers anticipate future conflict, they can proactively protect valued goals (e.g., by rearranging one's schedule; Duckworth, Gendler, and Gross 2016). Yet, consumers often neglect to take such actions (Ashraf, Karlan, and Yin 2006; Schwartz et al. 2014), suggesting they may underestimate future interference with their goals. Why might this occur? What aspects of conflicts encountered in the past might make consumers less likely to anticipate goal conflict in the future?

This research explores the role of variety (i.e., the degree of distinction or differentiation; Etkin and Sela 2016; Kahn and Wansink 2004) among past conflicting events. Missing three workouts due to work-related events (e.g., a meeting, a project, or a presentation), for instance, may seem less varied than three conflicts due to work, personal, and social events.

We propose that perceiving greater variety among a set of past conflicting events reduces expectations of conflict in the future. We predict this occurs because variety causes people to categorize past experiences as isolated, one-off events that are less likely to cause conflict in the future. By reducing expected future conflict, we further expect that greater variety reduces the likelihood of taking goal-protective actions. We test these predictions across six experiments.

Experiment 1 examines the basic effect and underlying process. Participants ($N = 233$) imagined having a goal to "get home by 6 p.m. every day after work" and read about past episodes of conflict that were either low variety (i.e., three work-related conflicts) or high variety (i.e., work-related, going to the gym, and helping a friend). Participants then indicated how much conflict they would expect with their goal in the future and the extent to which they categorized the conflicting events as isolated, one-off instances. As predicted, compared to the low-variety condition ($M = 5.70$), participants in the high-variety condition expected less goal conflict in the future ($M = 5.41$, $p = .037$), and this was mediated by categorizing conflicts as one-off events ($ab = -.19$, CI [-.33, -.09]).

Experiment 2 tests generalizability using participants' own personal goals and conflicts. Participants ($N = 208$) first identified a current personal goal and then described three instances when they experienced goal conflict (i.e., interference). In the high (vs. low) variety condition, participants then described how those conflicts were different (vs. similar). As predicted, compared to the low-variety condition ($M = 4.82$), participants prompted to perceive greater variety among past conflicts expected less goal conflict in the future ($M = 4.41$, $p = .024$).

Experiment 3 examines real experiences of conflicts in a controlled lab setting. Participants ($N = 136$) read they would complete two timed quizzes for a chance to win a bonus. During the first quiz, all participants experienced three episodes of conflict (i.e., tasks that interrupted the main quiz and consumed some of the limited time), and we manipulated variety among the conflicting tasks. We next measured how much goal conflict participants expected in the second quiz. As predicted, an ANCOVA (controlling for score on the first quiz) revealed that participants who experienced high (vs. low) variety conflicts expected less future conflict ($M_{low\text{-}variety} = 5.87$ vs. $M_{high\text{-}variety} = 5.40$; $p = .028$).

Experiment 4 examines the underlying process with moderation. Participants read they had a goal to exercise each day after work and had experienced three recent conflicts. In addition to the high and low variety conditions, we introduced a new high-variety/high-frequency condition, in which each conflicting event had occurred several times (i.e., to decrease the perception that high variety conflicts were isolated, one-off events). As before, participants in the high (vs. low) variety conditions expected less future conflict ($M_{low\text{-}variety} = 5.63$ vs. $M_{high\text{-}variety} = 5.31$; $p = .020$). Importantly, the effect of high variety was attenuated when conflicts were not perceived as one-off events ($M_{high\text{-}variety/high\text{-}frequency} = 5.72$; vs. high-variety $p = .003$; vs. low-variety $p = .538$).

Experiment 5 tests alternative explanations based on goal importance or controllability of events by using circumstantial conflicts (i.e., not pertaining to competing goals) that are beyond one's personal control. Participants ($N = 210$) read about having a goal to be home by 6 p.m. each evening. In the low variety condition, participants "had encountered extra traffic on their commute home" on three occasions, whereas in the high variety condition they had encountered extra traffic due to an accident, a broken traffic light, and a road closure. Consistent with previous results, participants in the high-variety condition expected less future goal conflict ($M_{low\text{-}variety} = 5.63$ vs. $M_{high\text{-}variety} = 4.95$, $p < .001$).

Experiment 6 explores downstream consequences. By decreasing expected future conflict, variety might also discourage interest in products or strategies that protect valued goals. Participants ($N = 232$) imagined having a goal to connect with friends regularly after work, read about three high (vs. low) variety episodes of past goal conflict, and then indicated interest in using a ridesharing app that would help them stick to their goal. As predicted, participants in the high-variety condition were less willing to pre-commit ($M_{low\text{-}variety} = 4.30$ vs. $M_{high\text{-}variety} = 3.83$; $p = .043$).

Across participants' own personal goals, laboratory tasks, and scenarios, we find that variety among past instances of goal conflict decreases expectations of future goal conflict. We find this occurs because variety encourages people to perceive past conflicting events as one-off, isolated occurrences. Notably, we find variety reduces expectations of future conflict in general (i.e., the effect is not limited to expectations for specific past conflicts). These findings further understanding of variety and categorization (Cohen and Basu 1987; Etkin and Sela 2016; Isaac and Brough 2014; Mogilner, Rudnick, and Iyengar 2008) and how past experiences shape expectations about the future. This research also has implications for consumer goal pursuit.

What Are The Key Drivers Of Consumer Preference For Crowdfunded Products?

EXTENDED ABSTRACT

Crowdfunding has emerged as an alternative means of financing new ventures. In this research, we ask whether and why having been crowdfunded carries any signal value for the broader market of observing consumers. Eight studies reveal that consumers demonstrate a preference for crowdfunded products over differently funded ones.

Crowdfunding is increasingly used as an alternative means of financing new ventures. Instead of asking venture capitalists, banks, or other professional financial service providers to invest in one's ideas, crowdfunding involves pitching those ideas directly to the general public, the potential customers of the resulting new product (Belleflamme, Lambert, and Schwienbacher 2014; Kuppuswamy and Bayus 2018; Mollick 2014). And this audience seems to be willing to invest: At Kickstarter, one of the leading crowdfunding platforms, about fifteen million individuals have been reported to have helped finance more than 146,000 projects since its launch in 2009 (Kickstarter 2018). More generally, crowdfunding platforms across the globe helped raise more than $ 30 billion in 2015 (Zvilichovsky, Danziger, and Steinhart 2018), a figure the World Bank estimated to triple by 2025 (WorldBank 2013).

The rise of crowdfunding in practice has sparked strong interest among scholars across disciplines such as finance, entrepreneurship, strategy, and marketing. Much of the recent attention has been dedicated to a better understanding of the consumers' motivations to participate in crowdfunding (e.g., Boudreau et al. 2015; Gerber, Hui, and Kuo 2012; Kuppuswamy and Bayus 2017; Ordanini et al. 2011; Zvilichovsky, Danziger, and Steinhart 2018), and the dynamics and success factors of the crowdfunding process (e.g., Agrawal, Catalini, and Goldfarb 2015; Burtch, Ghose, and Wattal 2013; Greenberg and Mollick 2017; Mollick 2014). In this paper, we build on this initial research and address the novel question of how crowdfunding is interpreted by the broader consumer market. Specifically, we ask whether non-involved consumers, that is, the entire market of a firm's potential future customers, differentially react to products as a function of the underlying product's venture funding history. On the one hand, crowdfunding has been portrayed as the last chance effort to bring a product to market (e.g., Belleflamme, Lambert, and Shwienbacher 2014; Brown, Boon, and Pitt 2017; Kuppuswamy and Bayus 2017). Financial analysts and conventional investors often interpret crowdfunding as a negative signal to the marketplace with respect to new product success (Carlozo 2017). On the other hand, we posit in this paper that firms will gain advantage by signaling that their product is crowdfunded. Similar to the enthusiasm identified in the investment decision for crowdfunded products, we contend that consumers will show a distinct interest in buying these types of products.

In Study 1, we test whether consumers prefer a crowdfunded product over alternatives using different experimental designs, manipulations, dependent variables, product contexts, and samples. Study 1A ($n = 1,512$, $M_{age} = 31$ years, 44% female, Prolific) examines whether consumers prefer a product that is described as crowdfunded compared to a baseline condition, which did not mention any funding source details, using an incentive compatible willingness to pay measure (a variant of the BDM procedure: Becker, DeGroot, and Marschak, 1964) as the dependent variable and digital notebooks as

the product category. In the crowdfunding condition, we discreetly implemented our manipulation using a statement about crowdfunding located as text above the product (which reads as follows Crowdfunded: The People spoke and put their money behind their words. Each of these products got its start as a successful crowdfunding campaign). In the baseline condition there was no respective information present. To maximize external validity, we took the crowdfunding signal from a real shopping website, Thegrommet.com, a website that sells crowdfunded products (including the ones shown to our study participants).

The results show a strong crowdfunding effect: participants are willing to pay about 21% more when the product was described as being crowdfunded compared to when no funding source information was present ($M_{crowdfunding} = 8.57$, $M_{baseline} = 7.11$; $F_{1,1510} = 14.81$, $p < .001$, $d = .20$). In a follow-up study (Study 1B: n = 100, $M_{age} = 38$ years, 35% female, Prolific), we replicate our focal effect using a more classic dependent variable, purchase intent, and, per consequence, by also including price information in the stimuli. An ANOVA on the purchase intention measure demonstrates that participants exhibit higher purchase intentions when the product was described as being crowdfunded ($M = 4.15$) compared to when no funding source information was provided ($M = 3.33$; $F_{1,98} = 5.17$, $p = .025$, $d = 0.46$).

Study 1C and 1D employed a direct comparison design following the recommendations of Meyvis and van Osselaer (2017). That is, participants were presented with two different products side by side with the only difference between conditions being the information regarding our independent variable – the funding source of the product. In Study 1C ($n = 390$, $M_{age} = 20.44$, 51% female, students), participants were introduced to two start-ups labeled Start-up A and Start-up B; one of which was described as having used crowdfunding whereas the other one as having used venture capital funding. Half of the participants were exposed to a condition in which Start-up A was described as crowdfunded and the backpack of Start-up B as venture capital funded; the other half was assigned to a condition where the backpack of Start-up A was described as venture capital funded and the backpack of Start-up B as crowdfunded. Product choice, our dependent variable, was captured by asking participants to indicate which of the two backpacks they would prefer. A logistic regression with actual product choice as the dependent variable and funding source as the independent variable demonstrates that consumers have a significantly stronger preference for the backpack when it is described as crowdfunded ($\chi^2 = 6.47$, $b = .52$, $SE = .20$, $p = .011$). For both backpacks, choice share for the crowdfunded alternative was higher than the venture capital funded alternative: 54% (backpack A) and 59% (backpack B).

In a follow-up study (Study 1D), we replicate the crowdfunding effect in another product category (cameras), using a relative preference measure as dependent variable (7- point scale), based on a different study population (MTurk, n = 302, $M_{age} = 37$, 57% female, MTurk), and, importantly, against a series of different control conditions (i.e., three alternative funding sources: venture capital, bank loan, or self-financing) to address the possibility that (nega-

tive) attitudes towards venture capitalists might, at least in part, have driven the effect obtained in Study 1C. When the Start-up B's camera was described as crowdfunded, participants reported a significantly stronger preference for it ($M = 4.42$) than when it was described as funded by venture capital, a bank loan, or self-financing ($M = 3.50$; $F_{1,296} = 15.37$, $p < .001$, $d = .45$). Critically, the 2(product flip) x 3(alternative funding source) interaction proved insignificant ($p > .20$), suggesting that the focal crowdfunding effect emerges strongly when pitted against all three control conditions.

In Study 2, we use in-depth interviews (28 in-depth interviews with informants from different backgrounds and socio-demographics; age range from 23 to 83 years, 11 female) as an exploratory approach to better understand what inferences consumers are making from the crowdsourcing signal, and seeing how these inferences are likely to motivate preferences for crowdfunded products. The qualitative study reveals that the crowdfunding effect we identify is driven by distinct inferences involving the quality of the crowdfunded product, the underdog status that often underlies crowdfunded firms, and the ability to bring equality to the marketplace by providing opportunity to crowdfunding initiatives.

In Study 3, we formally test these mediators using a direct comparison design.

Participants ($n = 200$, $M_{age} = 39$ years, 49% female, Prolific) were presented two cameras side by side – Luna and MySight – together with various product-related information that consumers are typically exposed to while shopping. They were randomly assigned to one of the two conditions (product Luna was described as being crowdfunded and the product MySight as being venture capital funded or vice versa). Everything else was identical between the two conditions. Purchase intention, the dependent variable, and the mediators were also captured using 3-item scales (αs ranged between .90 to .94). Participants demonstrate a significantly stronger purchase intention for the camera MySight when it was described as crowdfunded ($M = 4.47$) compared to when it was described as venture capital funded ($M = 3.36$; $F_{1,198} = 30.42$, $p < .001$, $d = .78$). A similar pattern of effects is obtained for each of the three process measures. First, perceived quality of MySight was significantly higher when it was described as crowdfunded ($M = 4.31$) compared to when it was described as venture capital funded ($M = 3.80$; $F_{1,198} = 6.95$, $p = .009$, $d = .38$). Second, participants perceived the start-up that developed MySight significantly more strongly as an underdog when it was described as crowdfunded ($M = 5.11$) compared to when it was described as venture capital funded ($M = 2.99$; $F_{1,198} = 151.97$, $p < .001$, $d = 1.75$). Finally, participants felt significantly more strongly that purchasing MySight will reduce inequality in the marketplace when it was described as crowdfunded ($M = 4.96$) compared to when it was described as venture capital funded ($M = 2.95$; $F_{1,198} = 131.64$, $p < .001$, $d = 1.62$). The results of mediation model using bootstrapping procedures (Hayes 2013) reveal that each of the three mediators (tested in isolation) yields a significant indirect effect of funding source on purchase intention (95% confidence intervals for perceived product quality [$CI_{95\%}$] = .09, .62; perceived underdog status [$CI_{95\%}$] = .04, 1.07; one's motivation to help reduce inequality in the market [$CI_{95\%}$] = .88, 1.52).

In our final two studies (4A and 4B), we focus on the equality mechanism by measuring and manipulating consumers' general preference for inequality, respectively, and testing whether this preference moderates the crowdfunding effect. In Study 4A ($N = 305$, $M_{age} = 35$ years, 48% female, MTurk), we again used direct comparison design (similar to Study 1D). We operationalize differences in preference for social inequality using social dominance orientation, which is conceptualized as an individual-level difference mea-

sure that represents preference for group-based dominance hierarchies in which dominant groups oppress subordinate groups (Ho et al. 2015; Jost et al. 2003; Pratto et al. 1994). Product preference on a 7-point item served as our dependent variable. We ran a hierarchical regression analysis with product preference as dependent variable, and preference for social inequality measure, dummy-coded funding source (0 = Start-up A crowdfunded and Start-up B venture capital funded, 1 = Start-up B crowdfunded and Start-up A venture capital funded), as well as the respective interaction term as the independent variables. Results reveal a significant main effect; participants indicated a stronger preference for the product of Start-up B when it was described as crowdfunded ($b = .86$, $SE = .21$, $p < .001$). As predicted, the analysis further revealed a significant interaction effect between funding source and preference for social inequality ($b = -.40$, $SE = .16$, $p = .012$), indicating that the preference for crowdfunded products is stronger for participants who are less accepting of social inequality. Indeed, a floodlight analysis, using the Johnson-Neyman technique (Hayes 2013), shows that the crowdfunding effect is only significant for participants who score low on the social dominance orientation scale (i.e., lower than or equal to 3.32). For participants who score higher on social dominance orientation, however, the crowdfunding effect was not significant (and, interestingly, directionally negative).

In Study 4B, we used a priming paradigm to manipulate preference for social equality.

Participants ($N = 406$, $M_{age} = 36$ years, 44% female, MTurk) were randomly assigned to conditions in a 2(funding source: Start-up A crowdfunded and Start-up B venture capital funded, or vice versa) x 2(acceptance of social inequality: high vs. low) between-subjects design experiment. They were asked to carefully read one of two different versions of an ostensible *New York Times* article which was designed to prime high versus low acceptance and support of social inequality. participants demonstrated a significantly stronger preference for the product of Start-up B when it was described as crowdfunded ($M = 4.59$) compared to when it was described as venture capital funded ($M = 3.64$; $F_{1,332} = 20.77$, $p < .001$, $d = .48$). Whereas the effect of the acceptance of social inequality factor on product preference was not significant ($F_{1,332} = .75$, $p = .39$, $d = .07$), we found, most critically, a significant interaction effect ($F_{1,332} = 5.79$, $p = .017$). In line with the equality mechanism, we found a positive and significant crowdfunding effect in the low acceptance of social inequality condition ($M_{start-up B crowdfunded} = 4.75$, $M_{start-up B venture capital funded} = 3.26$; $F_{1,332} = 23.38$, $p < .001$, $d = .77$). This effect, however, was not significant in the high acceptance of social inequality condition ($M_{start-up B crowdfunded} = 4.42$, $M_{start-up B venture capital funded} = 3.96$; $F_{1,332} = 2.39$, $p = .123$, $d = .23$).

Our study has several contributions. First, we clarify the signal that crowdfunding provides to the broader consumer market by demonstrating that having been crowdfunded can help differentiate products and ultimately increase demand for such products in the marketplace. Importantly, this effect materializes even after having controlled for a product's objective functional characteristics. Second, we explore the underlying causal reasons for this effect, finding three drivers that underlie consumer's preferences for crowdfunded products. Specifically, we see inferences regarding the quality of crowdfunded products, the underdog status underlying these products, and the ability of crowdfunding to drive out inequality in the marketplace motivate consumers to respond to this signaling. Third, we provide added insight to the inequality account by showing how robust this motivation is – i.e., defining it both through experimental manipulation and as a chronic trait belief of the consumer. This

identification broadens our understanding of where individuals see inequality by moving beyond race, gender, nationality, etc. to identify inequality in the marketplace as an important motivator in consumption. Indeed, our work shows that consumers will not only support activities that reduce social inequality among different kinds of people, but also in their consumption behaviors.

From a substantive standpoint, our findings highlight that under certain conditions start-ups and retailers alike might use "crowdfunded" as a differentiating attribute at the point of sale. Because it is currently a rarity to see crowdfunded labelling in the marketplace, we believe this finding provides a disruptive spark not only for crowdfunding thought but also for crowdfunding practice.

Identifying Topics and Trends in Research on Construal Level Theory

Susanne Adler, Otto-von-Guericke-University Magdeburg, Germany
Marko Sarstedt, Otto-von-Guericke-University Magdeburg, Germany

EXTENDED ABSTRACT

Construal Level Theory (CLT, Trope and Liberman 2003, 2010) proposes a positive and reciprocal relationship between psychological distance and the mental level of abstraction (construal level). According to this theory, distant times, spaces, persons and low probabilities relate to an abstract, high construal level way of thinking that entails focusing on gestalts rather than details, causes rather than effects, traits rather than states, and goals rather than means (Liberman and Trope 2014). CLT contributes greatly to various research fields by enhancing our understanding of human predictions, evaluations, and behaviors (Soderberg et al. 2015; Trope and Liberman 2010). In consumer research, CLT has gained a prominent place, for example by advancing knowledge on the formation of consumer's preferences and choices (Khan, Zhu, and Kalra 2011; Pizzi, Scarpi, and Marzocchi 2014; Trope and Liberman 2000).

Although research on CLT has produced several overview articles (Dhar and Kim 2007; Liberman and Trope 2014; Soderberg et al. 2015; Trope and Liberman 2010), a cross-cutting analysis overarching the breadth of research fields and themes related to CLT is missing. Following contemporary text analytic methods, we apply a Latent Dirichlet Allocation model (LDA, Blei 2012; Blei, Ng, and Jordan 2003) to extract latent research topics and identify relevant trends in CLT-related research. This procedure assumes that documents inherit different latent topics that are represented by specific terms. Following a probabilistic procedure, a LDA extracts the distribution of topics in each document and the distribution of terms per topic. Thereby, the analysis allows researchers to assess topic content (i.e. topics of CLT-research) and topic frequency among documents (i.e. the prevalence of each topic). To account for topic development, we assess the relative topic frequency over 10 years of CLT-research (2009-2018).

In order to apply the LDA, we obtained bibliometric data on CLT-research from the Web of Science. We included journal articles that correspond to search terms relating to CLT ("construal leve*," "mental construa*," "temporal construa*," and "psychological distan*"). Furthermore, articles had to be published in SCImago Q1 and Q2 ranked journals (SCImago n.d.). In a subsequent content analysis, we excluded a subset of articles that turned up as a sole result of the search term "psychological distan*" due to an insufficient proportion of relevant articles; furthermore, we excluded articles that were not sufficiently related to CLT. After preprocessing, our dataset included 576 documents by 1110 authors published in 195 journals. Starting from 1998, the number of CLT-related publications yielded up to 26 documents per year until 2010 and considerably increased thereafter ($n_{2009} = 26$, $n_{2010} = 25$, $n_{2011} = 43$, $n_{2012} = 44$, $n_{2013} = 50$, $n_{2014} = 51$, $n_{2015} = 70$, $n_{2016} = 69$, $n_{2017} = 73$, $n_{2018} = 77$).

For our topic modeling we used each article's keywords assigned by the authors or by the WoS (Keywords Plus™, Garfield and Sher 1993) and preprocessed the keyword list by merging similar keywords and excluding the most frequent and isolated keywords. This procedure resulted in a list of 635 terms, on which we performed the topic modeling by running the LDA 100 times and k-mediod clustering the results to ensure result stability (Mantyla, Claes, and Farooq 2018). After reviewing several solutions for stability and meaningfulness of the results, we extracted 20 topic clusters (TCs) with an average silhouette measure of cohesion and separation (Kaufman and Rousseeuw 2005) of .248, indicating an overall rather fuzzy solution.

Our results yield several growing TCs that refer to consumer research such as a TC on the public image of a company, including effects of advertising composition and corporate social responsibility. Other TCs relate to (online) communication among consumers (e.g. electronic word of mouth) and customer satisfaction, consumer decision-making and corresponding processes, or include research on prospect theory and related concepts. A TC with particularly growing prominence relates to climate change and energy production. A range of TCs can be linked to the different dimensions of psychological distance. Time-related TCs deal with future predictions, behavioral consequences of time-related thought, intertemporal choices, as well as with memory effects and time perceptions, while social distance related TCs include impression formation and pro-social behavior. Most of these distance-related TCs exhibit a relatively stable research interest, while the TCs on future predictions and impression formation seem to follow a decreasing trend. Hypothetical distance is represented by one slightly declining TC, while the spatial dimension is not clearly represented in any of the TCs. Our analysis further reveals a relative decrease in research interest in the TCs dealing with impulse control and automatic processes such as language use. The remaining TCs relate to organizational psychology and personality, while a number of internally quite heterogeneous TCs show relations to terror-management-theory and time considerations, cognition, and stimuli perception and processing.

To sum up, our results provide a valuable extension to existing review articles and meta-analyses on CLT by taking a broad text analytic approach. Our results underline the growing importance of consumer-related CLT-research ranging from 'classical' theories such as the prospect theory to emerging topics such as online communications and climate change. At the same time, we show that some classical areas of CLT-research like impulse control, impression formation, future predictions and probability are on the decline, which may point to notable shifts in research interest such as recent advances on metamotivation (Nguyen et al. 2019). Other valuable insights can be inferred from 'missing' TCs, for example, regarding spatial distance, emotion research, and sensory sciences.

New Media Technology Market Emergence: The Implication of Imagination Processes

Kelley Cours Anderson, Texas Tech University, USA

EXTENDED ABSTRACT

Today's media technology allows consumers unique ways to interact with both firms and other consumers (Zhang 2019). Yet, as new media technology emerges rapidly, this provides opportunities to fundamentally change the landscape beyond common imagination. This study investigates virtual reality (VR), a disruptive technology (Goldman Sachs 2016). Although the future of this technology is still unclear, this study hopes to add understanding of how media technology (i.e., VR-content) is mobilized in its early form and identify implications of the current and future market.

Market system dynamics research recognizes markets as complex social systems and investigates "how actors and institutions actively shape (and are shaped by) them" (Giesler and Fischer 2017, p. 3). Literature recognizes the important role different actors play to shape market systems (e.g., Dolbec and Fischer 2015; Giesler 2012; Humphreys 2010; Humphreys and Carpenter 2018; Karababa and Ger 2011; Martin and Schouten 2014). Technology can be disruptive to existing marketing systems (Giesler 2008)movies, software, and the written word; however, the exploration of how new media technology markets emerge is less explored.

As such, this study contributes to market systems dynamics literature by researching how media technology emerges and seeks legitimacy in multiple verticals, or industries, among a network of multiple actors. In particular, I explore: 1) what role do actors play to develop and mobilize VR-content into additional verticals, 2) what potential market futures are possible for VR-content, and, 3) what implications do these market futures hold for actors within the network?

Method

Using extended case method (ECM) approach (Burawoy 1998), I follow the early mobilization of VR-content among multiple actors within the market. ECM is a recommended approach (Arsel 2017), especially relevant for market studies wherein "the goal… is to construct fruitful extensions of theory rather than to subject alternatives" (Holt 2002, p. 73). This includes its inception from the start-up turned private firm and its interaction with the firms' internal actors and customers. VR-content technology investigated incorporates hardware (i.e., cameras) and software (i.e., artificial intelligence, platform) to generate the content to store and share the content. Data collection includes archival documents and semi-structured interviews with 38 informants who could speak to the mobilization of the technology. To analyze the data, I follow the multi-stage process used by Holt (2002).

Findings

I find that the technology mobilizes through imagination processes of firm-actors, customers, and consumers. Different forms of imagination processes among multiple actors drive the creation and growth of the VR-content market. Imagination in our literature commonly focuses on isolated forms of imagination, such as fantasy and sensory imagination (Philips 2017).

Market Emergence

The firms' actions in early development rely on recreative imagination processes, or the ability to envision the world differently than currently experienced, often resulting in foreseeing something that doesn't exist (Currie and Ravenscroft 2002). Initially, the develop-ers' goal of duplicating real-world spaces aimed to break down *"the barrier between the physical and digital worlds"* (press release)[1]. By envisioning an environment of digital duplicates, developers envisioned a world that did not exist. And while they were not able to imagine all functions and sensory elements related to the imagined world, it prompted the development of the VR-content technology.

Market Building

Actors participate in creative imagination (Currie and Ravenscroft 2002), where they combine ideas derived from past experience in unexpected ways. Creative imagination emerges when ideas are put together "in a way that leads to the creation of something valuable in art, science, or practical life" (Currie and Ravenscroft 2002, p.9). This stems from consumers' roles to build the market unexpectedly:

> *Every time you think you understand our customers, you find out about some guy in Zimbabwe that is using it to scan something you've never heard of before. We literally have people who are taking our camera and sticking it down manhole covers. Our camera was not designed to go down manhole covers.* (Andrew, firm-actor)

Many times, the roles of these actors are multiple and overlapping. For example, actors may come across the technology as a real estate consumer, but their imagination establishes new roles for themselves (i.e., customer) and the technology (e.g., innovative retail showroom). Through the imagination of multiple actors, the technology takes on new roles and is mobilized into multiple verticals, creating a wider network for the technology.

Market Futures

Further, I identify potential market futures envisioned by actors' recreative imagination. This reveals the opportunity for the content and its data derivatives to be used for further market expansion. This creates concerns for some forward-thinking customers:

> *I have almost 300 models in my account, and I would probably feel that somebody was taking advantage if they were using my content to create derivative work to license it…* (Roger, customer)

The tensions surrounding ownership of the content may hinder its continued mobilization and legitimization. The imagination of future market opportunities reveals several implications that may positively and negatively impact multiple actors in the network and may demand changes in the market's dynamics.

Discussion

This study contributes to the developing market system dynamics literature (Giesler and Fischer 2017). Specifically, this paper answers calls to understand market system dynamics when influenced by multiple contexts and views (Kjellberg et al. 2012). This study also responds to calls for a broader understanding of how imagination can influence innovative practices and overall markets (Akaka and Schau 2019; Jenkins and Molesworth 2018). This study also begins the exploration of potential power consequences of market

systems (Kjellberg et al. 2012), by revealing both positive and negative implications. Firms with a data surplus may result in significant scrutiny surrounding appropriate and ethical uses of this data (Zuboff 2019). Furthermore, tensions between actors' perspective of creative license may constrain potential market futures. With imagination comes responsibility (Brann 1991). This requires additional understanding by all stakeholders involved, and likely new actors (i.e., policy-makers) to be added to the system to facilitate this education process.

How Brand Conversations on Social Media Prompt Jealousy in Brand Relationships

Andria Andriuzzi, Université Jean Monnet, France
Géraldine Michel, IAE Paris-Sorbonne, France
Claudiu V. Dimofte, San Diego State University, USA

EXTENDED ABSTRACT

Prior research has shown that consumers develop feelings towards brands that are similar to those they have towards other individuals (Fournier and Alvarez 2012). One increasingly important avenue that practitioners employ in order to bring brands closer to consumers is social media and a wide range of online platforms (Voorveld 2019). A specific form of such interaction, *brand conversation*, is a particularly relevant construct consisting of a series of online messages exchanged between one or more consumers and a brand [representative]. The exchanges that brands and consumers have on social media are conceptually akin to social interactions, but happen to occur within new media types. Thus, research on social interaction is relevant to understanding the processes that may be at work.

In order to answers these questions, our research employs face-work theory (Goffman 1955), attachment theory (Park et al. 2010), and the interpersonal theory of love applied to consumer situations (Whang, Sahoury, and Zhang 2004). We propose that, similar to the case of personal relationships that involve affect, when a partner bestows flattery or compliments onto someone outside of the relationship there is the potential to threaten the other partner and produce jealousy, with potential deleterious effects on the relationship.

Developed by Goffman (1955), face-work theory explains how people behave when interacting with others. It assumes that during an exchange each participant commits to carrying out two simultaneous actions: maintaining their own face while ensuring the other participants do not lose face (Goffman 1955). To achieve this dual mission, they use a number of strategies aimed at avoiding face-threatening acts (FTAs) as well as producing face-flattering acts (FFAs) (Brown and Levinson 1987). In an online context, FFA can consist of flattering consumers, paying respect to them, or more generally of conveying appreciative expressions (Grossman 1998). FFAs have been shown to have a positive effect on consumers (Fombelle et al. 2016) and given that they are more efficient when produced publicly rather than privately one would expect face-work strategies to have an impact on consumers via social media. We thus expect that mimicking human interactions norms (e.g., using FFAs), will create consumer perceptions according to which brands have human characteristics. We also postulate that brand FFAs will be more or less well perceived depending on the degree of brand attachment. This is similar to social relationships, where those in stronger, closer ones are less likely to crave reinforcement than individuals who are part of weaker relationships.

Psychology research supports the existence of different flattery perceptions depending on context: we like better those who flatter us than those who flatter others (Vonk 2002). This occurs because most people have positive self-esteem and therefore are likely to think their ingratiator is sincere. Also, observers lack information on the target of ingratiation and thus will often question the ingratiated judgement. In a similar manner, consumers prefer being flattered by a favored brand to seeing strangers be flattered by it. If brand love (Batra et al. 2012) exists, then brand jealousy is sure to follow (Sarkar and Sreejesh 2014).

Previous research has addressed consumer brand perceptions along the warmth and competence dimensions (e.g., Fournier and Alvarez 2012; Kervyn, Fiske, and Malone 2012) and found that brand warmth (but not brand competence) is a key driver of consumers' online brand endorsements (Bernritter et al. 2016). This is in line with the intuition that personal relationships in which individuals invest the most tend to be affective in nature, as proposed by Berscheid's (1983) model of emotional interdependence in close relationships.

Formally stated:

Hypothesis 1:   *Brands are perceived as more human when they use FFAs addressed to consumers.*

Hypothesis 2:   *The use of FFAs addressed to other consumers produces higher brand humanization perceptions for consumers of low than for consumers of high brand attachment.*

Hypothesis 3:   *Consumers display jealousy after observing brand FFAs addressed to others.*

Hypothesis 4:   *Brand positioning moderates the focal effects, such that the links between the use of FFAs and (a) brand humanization and (b) jealousy is stronger for brands positioned on warmth relative to those positioned on competence.*

Study 1 ($N = 188$ adults from an online panel) addresses H1 and H2 in a 2 (brand FFA: absent vs. present) x 2 (brand attachment: low vs. high) between-subjects design. Participants imagined browsing their Facebook newsfeed and noticing a particular brand-consumer conversation. Brand FFAs were manipulated by including (or not) appreciative expressions into the brand's posts. Participants indicated the extent to which they anthropomorphized the brand on six 7-point semantic differential scales (adapted from Hudson et al. 2015; α = .89). A two-way ANOVA on perceptions of anthropomorphism with the two experimental factors as predictors uncovered a significant effect of brand attachment ($F(1, 182) = 26.57, p < .001$) and a significant interaction between the two factors ($F(1, 182) = 7.19, p < .01$). Consumers not particularly attached to the brand perceived the brand as more human when employing FFAs (vs. when not), but this effect was absent for consumers strongly attached to the brand.

Study 2 ($N = 397$ undergraduates) assesses the extent to which consumers would perceive the brand as more humanlike and express more positive brand perceptions and less jealousy when they (vs. another consumer and vs. control) would be the target of a brand's flattery (H3). The design was thus a three-cell (FFA target: self vs. other vs. control) between-subjects comparison. Participants were asked to provide a specific brand that they had a relationship with, which was subsequently employed by the software in the study's cover story. The subsequent procedure and measure were similar to Study 1. A one-way ANOVA on the brand anthropomorphism item revealed a significant main effect of FFA: $F(2, 389) = 5.65, p < .01$. Respondents perceived that a brand's use of FFAs, whether aimed at the self ($M = 5.05$) or another consumer ($M = 5.20$) appeared as more humanlike than the same brand not employing FFAs ($M = 4.60$). Furthermore, participants observing an FFA aimed at the self reported less jealousy ($M = 5.19$) than those observing the brand aiming the FFA at another consumer ($M = 4.57$) or those noting a brand conversation that did not include an FFA ($M = 4.53; F(2, 389) = 17.75, p < .001$).

Study 3 (N = 126 undergraduates) adds a brand positioning variable such that more jealousy was expected when the brand was positioned on warmth rather than competence (H4). The design was thus a 3 (FFA target: self vs. other vs. control) x 2 (brand positioning: on warmth vs. competence) between-subjects. The cover story and measures replicated Study 2. Participants assessed brand positioning on a 6-point semantic differential item anchored at 1 = *definitely warmth-based* and 6 = *definitely competence-based*. A two-way ANOVA with the two experimental factors as predictors and the brand feelings item as the dependent measure revealed a significant main effect of FFA: $F(2, 120)$ = 4.16, $p < .02$. Participants observing an FFA aimed at the self reported less jealousy (M = 5.43) than those observing the brand aiming the FFA at another consumer (M = 4.93) or those noting a brand conversation that did not include an FFA (M = 4.81). However, this effect did not vary significantly by brand positioning, potentially due to the study's low power.

While much research addresses the effects of social media in general, little is known about how brand flattery impact consumer response. This research identifies the relationships between brand flattery, brand humanization, and brand jealousy, thus contributing to literature on brand-consumer relationships.

Food App-reciation : How Nutrition-related Apps Shape Food Choices and Consumer Wisdom ? A Case Study Approach.

Camille Anin, Université Grenoble-Alpes, France
Agnès Helme-Guizon, Université Grenoble-Alpes, France

EXTENDED ABSTRACT

Food is one of the cornerstone of well-being. But food and food-related decisions are complex choices often experienced as a source of stress and anxiety (Rozin, 1999). And health and sustainability are growingly valued by consumers when making food choices, increasing the number of guiding food values and subsequent need for trade-offs between them (Kriflik & Yeatman, 2010 ; Aschemann-Witzel, 2015). In this context, mobile apps are flourishing in order to help people make healthier food decisions. Although food purchasing is a key moment in the food consumption cycle, research paid little attention to the mobile apps dedicated to help consumers when purchasing food. Prior research on nutrition apps has focused on consumer attitude (Doub et al., 2015), engagement (Flaherty et al., 2019) and behavior change techniques (Flaherty et al., 2018; Gilliland et al., 2015). We argue more qualitative studies are required on the use of those food-related apps by consumers in order to investigate the impact of mobile app not only on app use and healthy behavior but, more largely, on consumer decision-making and consumer well-being.

This paper explores how nutrition apps guide consumer decision-making and affect consumer well-being, drawing on the food-choice process model (Connors, 2001) and consumer wisdom (Luchs & Mick, 2018). The food-choice process model (Furst et al., 1996; Connors et al., 2001) offers a comprehensive framework in which food choices are complex choices and lead people to rely on a personal food system that guides their food values and subsequent choices. Health, taste, cost, managing relationships, and convenience are major food values while other less prominent food values exist such as waste, ethics or symbolism (Connors et al., 2001). Consumer wisdom refers to consumer judgements aligned with "a synchronization of values, goals, and action" in the pursuit of well-being (Luchs & Mick, 2018) and enables us to further explore food values. According to Sternberg's (1998), wisdom is related to tacit knowledge, "*an action oriented, typically acquired without direct help from others, and allows individuals to achieve goals they personally value"*. We purposefully chose Sternberg's (1998) balance theory of wisdom to explore consumer wisdom as it offers a perspective on balance arising from person-context situation complementary to the value management system proposed within food-choice process model. The food-choice process model and the balance theory of wisdom enable to dig deeper into the complexity of food-related choices and associated consumer decision-making strategies.

In order to investigate the influence of food app use on consumer decision-making and well-being, we chose Yuka as a case-study. Yuka is a popular app in France which enables to scan food products and immediately have access to an overall product evaluation in order to make healthier choices and by having suggestions of healthier alternatives. The depth interviews with 18 users were conducted by the researchers and trained students. Participants were aged between 20 to 70 yo. Most of them (16 out of 18) were women. The interviews lasted 30 to 60 min and were fully transcribed. Content analysis included three *a priori* themes. The three first theme were based on Sternberg's (1998) balance theory of wisdom which defines tacit knowledge as: procedural and action-oriented (1), relevant to the attainment of goals people value (2) and acquired with little help from other (3). A fourth theme was created *a posteriori* to embrace participants' ambivalence regarding the ability of the app to enhanced their wisdom as consumers. An summary of results is available at Table 1.

Balancing Health with Other Food-related Values (Yuka as a Wisdom Manager). All interviewees declare using Yuka in order to make better and more informed food choices and to consume product good for their health (and, for some, for the environment). The knowledge provided by Yuka is considered relevant to the pursuit of health goals valued by consumers. Meanwhile, they display micro-strategies to ensure their personal pursuit of well-being. Yuka provides some information to make healthy choices. However people take in account other food-related values (Connors, 2001) than health, such as price, taste, convenience or managing relationships, acknowledging that food choices is not only a personal but also a social choice. The best ranked product is not always considered the best option and some participants reported to make their own personal ranking based on their appropriation of the information provided by Yuka.

Pursuing Personal and Collective Well-being (Yuka as a Source of Consumer Wisdom). The mobile app provides third-party information about properties and ingredients of food products, contributing to healthier food choices. Food knowledge provided by Yuka is both procedural and action-oriented. Yuka can contribute to consumer wisdom through its influence at both individual (consumers' conscientization about food products in order to adopt a healthier lifestyle) and more collective level (influencing the food industry toward the production of healthier food). To this regard, it can be considered as a source of consumer wisdom. Nevertheless, not all participants shared this optimistic perception of Yuka. For most of them, doubt and wisdom can be closely entangled.

Fostering Wisdom, Creating Doubt (Yuka as a Wisdom Enhancer). Yuka appears, for users, as a relatively credible option to help them make better choices with little help from others. Using Yuka both diminishes a feeling of uncertainty and fosters new forms of consumer skepticism. Critical thinking can be applied either to the food industry or both to the food industry and the app, considering that Yuka may be an extension of the food industry and may not entirely be reliable. Absence of more valuable alternative lead those consumers to use the app while they do not entirely trust it. Yuka can offer consumers opportunities to critically assess the information they receive.

Empowering People through Wisdom ? Yuka as an ambiguous source of tacit knowledge. A paradox lies in the interviewees' narratives. On the one hand, Yuka can be experienced by some participants as an empowering app as it can produce a higher sense of agency and perceived control. On the other end, some participants realized that their control over their food choices is limited for three main reasons. Firstly, they feel lost when the alternative product suggested by Yuka is not accessible. Secondly, they experience a feeling of a "health diktat" that somehow prevents them from valuing other food values than health, values that matter to them. Thirdly, when they are not able to use the app, they get anxious about making a good choice as they became dependent on it. The overreliance on the app as an exclusive source of information may have unexpected consequences on consumers' confidence to make appropriate choices on their own, undermining consumer well-being on the long run. Empowerment related to perceived control should be distinguished from

"effective" control on health behavior, which echoes the discussion on the different meaning of empowerment in marketing (Bachouche & Sabri, 2018; Fayn, 2019).

Our research highlighted that Yuka is an app that can be looked at as potential a source of consumer wisdom (by balancing different food values, helping consumers to have a great influence on their food choices and on the food industry, by fostering consumer's critical thinking). Yet, research calls for caution to consider it as an actual source of wisdom. Yuka is an ambivalent ressource: combinaison of above mentionned factors may lead people to make whether empowering or disempowering choices. Food app use may create feelings of loss of control, both threatening consumer well-being. Future research could pay attention to factors of (dis) empowerment such regarding food app use as level of food literacy should deserve more attention. This exploratory is not without limitations regarding the limited diversity of the sample and the exclusive use of depth interview. Nevertheless, this research provide valuable insights for future research, underlining the need to connect food-related apps use with literature on consumer empowerment but also to pay more attention to the experiences of anxiety and its consequences on consumer well-being.

Strategic Product Displays on Social Media Through Proactive Nostalgia

Eda Anlamlier, University of Nevada, Las Vegas, USA
Sevincgul Ulu, New Jersey City University, USA

EXTENDED ABSTRACT

Nostalgia is a commonly felt longing for the past and usually associated with positive feelings such as warmth, joy and gratitude (Holak and Havlena, 1998; Sedikides at al., 2008; Wildschut et al., 2006). Recently, nostalgia on social media become so prevalent that about 520 million posts have been shared with the hashtag of #tbt (Throw-Back-Thursday; as of March 1, 2020). While some social media platforms (e.g., SnapChat and Instagram) let users create temporary posts, i.e., sharing pictures and videos that disappear soon, sharing posts permanently has been the default function for many social media outlets (Sheldon and Bryant, 2016). The present research uncovers how and why consumers decide to publicly document current consumption experiences on social media, which is different from savoring past experiences or future experiences (Chun, Diehl, and MacInnis, 2017).

When products are included in social media posts, the intention to remember them in the future can impact the duration of posting. Particularly, one can keep a post of a possession for a day (temporary/ephemeral posting) or years (permanent posting). The present research explores how consumers strategize the social media display of two types of products: (1) experiential products, through which consumers wish to gain life experiences and (2) material products, through which consumers intend to receive physical benefits (Van Boven and Gilovich, 2003). Previous research show experiential products deliver more, longer-lasting satisfaction and happiness compared to material products (Van Boven and Gilovich, 2003). Therefore, we predict consumers post experiential products permanently on social media more often than material products as reminders of valuable moments they wish to remember later. We define this phenomenon as *proactive nostalgia* referring to the realization that one would wish to remember and cherish a current consumption experience in the future.

The present research investigates whether consumers strategize display duration of products on social media based on product type and whether it is due to elevated proactive nostalgia, the goal of savoring a specific consumption experience to remember and relive it later.

Hypothesis 1: Consumers share experiential products on social media for long-term more often than they share material products.

Hypothesis 2: Proactive nostalgia increases the tendency to share consumption experiences on social media for long-term.

Hypothesis 3: Consumers share experiential products on social media for long-term due to proactive nostalgia motivation.

Study 1a

Study 1a explored how social media users shared material vs. experiential products. MTurk workers (N=192; 47% female; 50% between age 35-44) imagined either having a good picture/video of something they experienced (experiential product) or a product they have (material product). Next, they reported whether they would want to share a short-term vs. long-term post about it on social media.

A chi-square test of independence showed the relation between product-type (experiential vs. material) and display duration (long-term vs. short-term post) was significant (X^2 (1, N= 192)=12.92, p< 0.01). Participants tended to share more long-term posts about their experiences (80%) than material products (55%) supporting H1.

Study 1b

Study 1b aimed to replicate Study 1a findings utilizing a similar design but examining real life behaviors. College students (N= 149; 42% female; M_{age} = 21) reported how they shared their products and experiences on social media in the past. The result of the chi-square test of independence demonstrated participants created long-term posts about their experiences on social media more frequently than material products (X^2 (1, N=149)= 3.68, p= 0.055). Findings suggest people strategize product displays on social media based on product type.

Study 2

Study 2 investigated the relationship between product type and social media display duration utilizing a between-subjects design (3D TV: as an object vs. an experience; Mann and Gilovich, 2016). College students (N=231; 55.84% female; M_{age}=23) reported how much they would share this 3D-TV as a temporary vs. permanent post on a 7-point scale.

ANOVA results showed participants in the experiential (vs. material) product condition reported significantly greater tendency to post the 3D-TV permanently (F(1, 229)= 4.71, *p*= .03). Participants in the experiential product condition were more likely to share their 3D TV as a permanent post ($M_{Experiential}$= 2.28) than ones in the material product condition ($M_{Material}$= 1.79).

Study 3

Study 3 examined whether people share experiential products for long-term due to proactive nostalgia. College students (N= 221; 43% female; M_{age}= 20) reported their proactive nostalgia level using the Proactive Nostalgia Scale (Alpha=0.87; "I want to remember my post in the future"; "My post will maintain its value over time"). Regression results revealed proactive nostalgia significantly elevated the tendency to post for long-term (b= .50, t(1, 220)= 6.76, p< 0.01) supporting H2.

Study 4

Study 4 investigated whether proactive nostalgia mediated the relationship between consumers' product type perception and posting duration. MTurk workers (N=202, 67% female, Mage=36) were requested to imagine buying a new 3D-TV (Mann and Gilovich, 2016) and sharing a post about it. They stated how they would share the post (temporary vs. permanent) and answered the Proactive Nostalgia Scale (as used in Study3). Lastly, they answered how much they viewed the 3D-TV as an experiential product.

Mediation results with 5000 bootstrapping (Model 4; Hayes, 2017) show the effect of perceived experience level on posting tendency was fully mediated by proactive nostalgia (indirect= 0.17, SE= 0.05 95% CI (0.0686 - 0.2670)). Both the effect of perceived experience level on proactive nostalgia (b= 0.20, t(198)=3.48, p< 0.01) and the effect of proactive nostalgia on posting tendency (b= 0.85, t(197)=12.78, p< 0.01) were significant. Thus, confirming H3, the ef-

fect of perceived experience level on posting tendency was mediated by the proactive nostalgia level.

GENERAL DISCUSSION

Findings of five studies suggest when consumers perceive their possessions as experiential, they experience proactive nostalgia, which motivates them to increase product display duration on social media. The emergence of proactive nostalgia suggests the utility of social media has expanded from sharing current activities and remembering past to creating positive memories for the future. Current findings illuminate how experiential products help consumers create valuable memories to cherish later, which could boost inspiration and goal pursuit (Stephan et al. 2015) and reveal product valuation differences based on product type.

Ontography and Sustainable Consumption
Eric J Arnould, Aalto University School of Business, Finland

EXTENDED ABSTRACT

This paper investigates the possibility of neo-animistic renewal and offers a glimpse of a sustainable consumption system against the ecological precarity consumer capitalism produces. Neo-animism addresses the challenges imposed by the Dominant Social Paradigm (DSP) identified in micromarketing (Kilbourne, McDonagh, and Prothero 1997), the enduring attitude-behavior gap identified in green consumer research (Tarfaoui and Zkim 2017), the partitioning found in consumer practice research, and the limitations of marketing's social exchange paradigm (Bagozzi 1978; Brinberg and Wood 1983; Pandya and Dholakia 1992).

From animist ontography (Costa and Fausto 2010; Descola 2012), critical and transformative marketing and consumer research can find fresh insight and guidance for diagnosis of successful and flawed experiments in sustainable consumption. Tsing's (2015) account gives glimpses of an eco-economy structured by the neo-animist governance mechanisms Descola identifies in his comparative ontography of human foraging/horticultural cultures. Tsing defines a contemporary neo-animistic consumption system that matsutake, an aromatic mushroom symbolic of Japanese identity, and consequently prized as a gift, organizes. Reinterpreting Tsing's ethnographic material, I suggest structuring moments in the system entail relations of complementary predation between pine forests, pine forest soils, matsutake spores and hyphae, and the matsutake foraging communities. Tsing shows each feeds off the other, allowing all to thrive together in degraded environmental conditions. Humans cannot control matsutake only foster it (p.259) much as Amazonian foragers nurture that environment (Kohn 2013; Levis, et al. 2017; Rival 2012). In the US, matsutake foragers are caste-offs, comprised of homeless, unemployed veterans, former hippies, out of work loggers, and Southeast Asian refugees. Matsutake foragers predate the mushrooms; they procure through forest access.

The bulking and exporting process translates the matsutake foragers' unalienated "freedom trophies" into commodities with exchange value. However, gifting structures each of the human links in the value chain. For example, foragers "make" bulkers buy "baby" matsutake with no market value down the value chain but which cement relations between foragers and bulkers (p.130). In rural Yunnan, small town bosses and foragers do not negotiate prices, reciprocal social entanglements mean the bosses give the pickers "their best price" and foragers "trust" the buyers (p.275). In Japan, wholesalers and retailers translate the matsutake commodity definitively back into the gift economy, "matchmaking" specific customers to specific mushrooms. Almost no one buys a fine matsutake just to sell or eat (p.124). Wholesalers, retailers, and final customers gift mushrooms to particular partners to build relational ties; commodification diminishes with each successive transfer.

A multispecies partnership, in which human and nonhumans associate primarily through transitive relations of complementary predation, exchange and gifting in "patterns of unintentional coordination" (p. 23), is instrumental to the emergence of a global matsutake trade, supplying the Japanese gift economy. Tsing (2015, 4) says, "To follow matsutake guides us to possibilities of coexistence with environmental disturbance," which has become, the general condition of existence today. The matsutake system signifies the possibility of neo-animistic ontological renewal and offers a glimpse of a sustainable eco-conomy amid the increasing precarity a naturalist ontology harnessed to consumer capitalism inevitably reproduces. With a shift from a naturalist regime of governmentality to a neo-animist one similar to what Tsing describes, a sustainable future is possible.

Research on "green" consumerism whether undertaken from predominantly managerialist, ethical, or practice-theoretical perspective, shows that consumers have neither the institutional autonomy to identify sustainable behaviors from unsustainable ones or the cognitive, institutional, or moral capacity to consistently "choose" to practice the former rather than the latter (Bartiaux 2008; Cherrier, Szuba and Özçağlar-Toulouse 2012; Cluley and Dunne 2012; Shove 2003). Even theories like Service-Dominant Logic has not overcome implicit premises that privilege human agency and naturalize the market economy within the DSP (Bagozzi 1978; Campbell, O'Driscoll and Saren 2013; Hietanen, Andéhn and Bradshaw 2018; Vargo and Lusch (2016). Further, principles of environmental protectionism built into environmental certifications (e.g., brands like Marine Stewardship Certified, or Forest Stewardship Certified) and ecotourist services simply reproduce the paradigmatic binary that divides active human subjects from passive natural objects (Argyrou 2005; Bradshaw and Zwick 2016; Sullivan 2009), and codifies the exploitation of the latter by the former (Goldman 1997; Muraca 2016). However, based on an anthropological ontography that aligns with post-humanist feminism (Åsberg and Braidotti 2018; Koistinen and Karkulehto 2018), this paper argues for a neo-animist ontology as a solution to paradigmatic barriers to a sustainable economy.

A return to a fully animist ontology after the historical encounter with the benefits of natural science seems idealistic. However, recognition of ecosystems and the species within them as evolutionary units (Migliano, et al. 2020) and all biological entities as communicative (Descola 2012; Kohn 2013: Sprenger 2016) is consistent with contemporary natural science. Consequently, a neo-animistic consumer subjectivity could recognize the mutual dependence of all entities in the global biome and attend to their communicative intentions and resource requirements. Neo-animism could sanction predation but insist on preserving the conditions that make it possible (Descola 2012; Hill 2011). Neo-animism could sanction exchange but recognize the sterile futility of private hoarding (Petersen 1993). Neo-animism could sanction gift giving but recognize that the biome is the source and destiny of all value. Neo-animist consumerism represents enriched material relationships between people and other entities, is not anti-materialist. As an eco-economic system, neo-animism could challenge the DSP, build attitude behavior gaps out of economic relationships, and through foregrounding gifting, reciprocal exchange and complementary predation, enhance reciprocally fruitful practice between human and other living communities. By extending and elaborating on our communicative experiences with non-human entities, a new social imaginary replacing scientific modernity (Fox and Allred 2020; Taylor 2002), that is, an "ecological ontology is a possible outcome" (Feenberg 2001, 8).

The Influence of the Short-term Installment Payment Method on Consumer Purchase Decisions

Rhys Ashby, Macquarie University, Australia
Yi Li, Macquarie University, Australia
Shahin Sharifi, Macquarie University, Australia
Jun Yao, Macquarie University, Australia

EXTENDED ABSTRACT

An emerging and rapidly growing type of short-term interest-free installment payment method is claimed to increase consumer spending compared to cash and credit cards. Unlike personal loans, installment payments are generally paid in full in less than two months, with no interest and fees. Klarna and Afterpay, leading installment payment providers, split consumer's purchases into four equal installments without charging any interest or fees (Andriotis and Rudegeair 2019). Consumers receive their purchase upfront, followed by automatic payments every two weeks to complete payment in 6 weeks when the first installment payment is made at purchase. The installment payment method has grown rapidly; during 2019 in the U.S. 6 million consumers joined Klarna for the first time (Lindberg 2019) and 3 million used Afterpay for the first time (Afterpay 2019a). Consumers surveyed indicated that installment payment services "allowed them to buy more expensive items …(81%), spend more than they normally would (64%), and make more spontaneous purchases (70%)" (ASIC 2018, p.11). However, whether and why installment payments influence spending, as reported by consumers, has not been researched. This research provides empirical evidence and an explanation of the psychological process underlying the effects of installment payments on consumer spending.

Payment methods impact consumer spending by influencing the pain of payment, which is the negative affect of parting with money (Prelec and Loewenstein 1998). The extant literature finds that decreasing the objective payment magnitude reduces the pain of payment (Shah et al. 2016; Zellermayer 1996). In this research, we argue that the *subjective* price magnitude is influenced by installment payments, which also reduce the pain of payment. This account is supported by the numerosity heuristic; magnitude is inferred from the number more than the unit used to represent a quantity. Hence, a large number of small units is perceived as larger in magnitude than a small number of large units, e.g., 12 months are perceived as longer than 1 year (Lembregts and Van Den Bergh 2018; Pandelaere, Briers, and Lembregts 2011; Pelham, Sumarta, and Myaskovsky 1994). By extension, this research posits that installment payments function as a pricing unit which has lower numerosity than the total purchase price. For instance, a single purchase payment of $160 is more numerous and feels more expensive than four installments of $40, which in turn is more numerous and feels more expensive than eight installments of $20. Prior research shows that by reducing the pain of payment, credit cards (vs. cash) increase purchase intention and consumer spending (Raghubir and Srivastava 2008; Soman 2001; Thomas, Desai, and Seenivasan 2011). Extending this research, we predict that compared to other payment methods (e.g., cash and credit cards), installment payments are perceived by consumers as less expensive than the full price, which in turn lowers the pain of payment experienced, and subsequently increases consumer purchase intention and spending.

Study 1 (n=104) tested the effect of the installment payment method on the amount spent compared to cash. Participants randomly assigned to either a cash or installment payment condition chose clothes to purchase from a range varying in design and price. Participants in the cash condition saw only the full price (e.g., "$80"), and those in the installment payment condition read a brief description of Afterpay and saw both the full price and the installment price (e.g., "4 installments of $20"). The results suggested that installment payments prompted participants to spend more by choosing more expensive items (versus a greater number of items). This finding supports the numerosity account whereby lower installment prices increased the propensity to spend more.

Study 2 (n=187) tested the effects of installment payments on purchase intention compared to credit cards and the proposed underlying psychological process. MTurk participants were assigned to either an installment payment or a credit card condition in an online shopping scenario when buying a new fridge. Participants saw an image of a fridge and those in the installment payment condition saw the additional text of "$150 x 4 by PayLater" and a short description of the fictitious third-party "PayLater" installment payment service. As predicted, compared to participants in the credit card condition, those in the installment payment condition expressed greater purchase intention, lower perceived expensiveness, and lower pain of payment. A significant serial mediation test supported the proposed process. Compared to credit cards, installment payments decreased the perceived purchase expensiveness, which in turn decreased the pain of payment and subsequently increased purchase intention.

Study 3 (n=301), instead of comparing installment payments to other payment methods, manipulated the number of installments to test the effect of the numerosity of installment prices on the pain of payment, and its subsequent effect on the amount spent. Participants were provided with a brief description of the installment payment service and a choice between two hotel rooms. Participants viewed the cheap or expensive hotel room in either more numerous installment payment prices (4 payments of $54.00 versus 4 payments of $72.00) or less numerous installment payment (8 payments of $27.00 versus 8 payments of $36.00). Study 3 revealed that more individuals chose the more expensive item when presented with less numerous installment payment prices. Serial mediation analysis confirmed that exposure to less numerous prices lowered perceived expensiveness and elicited less pain of payment, resulting in more individuals choosing the more expensive item. This result confirms that differences in spending behavior using installment prices are separate from any other known payment method differences.

This research makes several important contributions. This research provides empirical evidence of the effects of installment payments on consumer spending and an explanation of the psychological process underlying the effects. The effects of installment payments to increase spending in this research mirror both self-reported consumer data (ASIC 2018) and the claims of installment payment providers (Afterpay 2019b). We extend the numerosity literature to the domain of payment methods by uncovering that less numerous installment payment prices increase spending. We also contribute to the payment method literature by revealing that the pain of payment is influenced not just by price, but also by how the price is perceived.

The Process of Enacting Consumer Utopias: An Ethnography of Digital Nomadism

Aleksandrina Atanasova, Royal Holloway, University of London, UK
Giana Eckhardt, Royal Holloway, University of London, UK
Katharina C. Husemann, Royal Holloway, University of London, UK

EXTENDED ABSTRACT

Our contemporary times are characterized by constant mobility, increasing dematerialization and digitalization of life, shifting social norms, and omnipresence of change. Aptly labeled "liquid modernity," this modern context is a source of both unprecedented freedom and uncertainty (Bauman 2000). Liquidity can be challenging for many consumers (Bardhi and Eckhardt 2017; Bauman 2007) who may be facing the inherent effects of late modernity—professional and economic precarity, acceleration (Rosa 2013), generational anxieties and burn-out (Petersen 2020). As such, liquidity can trigger "fresh start mindsets" (Price et al. 2018) and energize urges for betterment and reinvention (Giddens 1991; McCracken 2008) where a different way of being in the world is imagined possible. This human propensity to continuously "measure the life 'as it is' by a life 'as it might or should be'" (Bauman 2003, p.11) has for centuries converged within the notion of utopia—an ambivalent construct at the juncture between hope and desire for something other than what is presently had (Levitas 2011). While colloquially understood to denote an impossibility or a vision for an ideal society, as an analytical construct utopia is not merely a depiction of an ideal life, but a practice that draws on the issues of its contemporary times—a lens used by actors for understanding and transforming their particular circumstances (Gordin et al. 2010). In consumer research, however, how such transformative utopias are constructed and enacted in the context of liquidity is not well understood.

Although a plethora of consumption contexts and performances have been identified as utopian or holding utopian potential—from retail malls (Maclaran and Brown 2005; Murtola 2010), to festivals and fandoms (Kozinets 2001, 2002), to neighborhoods (Chatzidakis et al. 2012) and even social media (Kozinets 2019)—in these studies, utopian visions have typically been seen as residing in solid spaces, facilitated by solid ownership and consumption, or being shared in character, enacted collectively. However, with the dematerialization and digitalization of consumption across contexts and consumption-scapes, many consumers' utopian imaginaries are becoming deterritorialized and disembedded from the solid (Bauman, 2007). It has been suggested that, in the context of liquidity, consumers' urges to transform reality are increasingly shaped by a new type of liquid utopian thinking, where utopian praxis is framed not within the collective or the solid, but within a realm of hyper-individualization, quick access and instant-gratification (Bauman 2007). In this research, we therefore ask, how do consumers construct and materialize such liquid utopian visions for betterment and transformation, and what are the implications of these processes for consumption?

We explore this question through a multi-sited ethnography of digital nomadism—a global counter-movement where large cohorts of demographically diverse consumers choose to dispose of most of their possessions and serially relocate, working from their laptops and building lifestyles outside of the margins of the traditional societal structures of 9-5 work life, home-ownership and predictable career trajectories (O'Reilly and Benson 2016). Digital nomads deliberately design and construct ideal "liquid" lives, where tensions that ensue from liquid modernity are suspended and counteracted with short-term pursuits of happiness via global mobility and rejection of normative lifestyles (Atanasova and Eckhardt 2020). While data collection is currently ongoing, early analysis draws on an ethnographic study of one the largest events for digital nomads—a bi-annual community gathering known as The Nomad Cruise, which attracts hundreds of digital nomads from around the world in a single space, a cruise boat taking passengers to various destinations around the world. We attended Nomad Cruise 8, a one-week cruise in April 2019 from Las Palmas, Spain to Lisbon, Portugal, where we also stayed in a co-living hub for digital nomads for additional days of after-cruise events. Embodied participation in nomadic gatherings, workshops, and social events, alongside participant observation, depth interviews, video and audio diaries, extensive field notes, and photographs comprise the primary pool of data from which we draw analytical interpretation.

Our findings speak to a process through which digital nomads enact liquid utopian practices for betterment and transformation in an increasingly precarious context. To frame our analysis, we draw on the Cruise's program where each day focused on a certain phase of transformation: Day 1: Setting sail; Day 2: Get out of the cubicle; Day 3: Scale your business; Day 4: Deep dive in nomading; Day 5: Hack yourself; Day 6: "It's just a beginning." This sequence emerged as an emic structuring device of our findings. We demonstrate that digital nomads' utopian practice for reinvention and transformation in liquidity is experienced as a lived process of three main stages: (1) breaking the chains of solidity by unrooting and disembedding from 9-5 work/life structures and future planning; (2) engaging in reflexive self-hacking and emancipatory reinvention, facilitated by letting go of possessions and past life narratives, and shifting consumption orientations toward liquid consumption, experiences and self-transformational practices; and (3) disseminating utopian visions through commercialization and marketization of know-how for "hacking life," offering to others blueprints for speedy escape and reinvention through liquidity. Our findings suggest that through immersing themselves in a form of hyper-liquid living and consumption, digital nomads engage in strategic pursuits of utopian desire, where their critique of rigid, solid structures propels an urge for a perpetual escape from the constraints of societal expectations.

We contribute to utopian consumer research (Kozinets 2019; Maclaran and Brown 2005), by mapping out the role of liquid consumption in enabling transformative utopian visions in an era of digitalization and dematerialization. We also extend the domain of extraordinary experience research, highlighting that, in liquidity, consumers eschew postponing consumption of experiences for an imagined future and decidedly focus on the present; and that, in contrast to Weinberger et al. (2017), previously idealized future goals of being married, having a family and owning a home are social norms that for many are losing appeal in liquidity. Further, we contribute to lifestyle design and self-optimization research by showing how consumers' aversion from future-planning in liquidity redirects their motivations away from extended projects of identity building through solid consumption, and toward adaptive, commoditized blueprints for instant utopian selves.

Loyalty Point Spending and Stockpiling – A Construal Perspective

Charan K Bagga, University of Calgary, Canada
Alina Nastasoiu, Booking.com
Neil Bendle, University of Georgia, USA
Mark Vandenbosch, Western University, Canada

EXTENDED ABSTRACT

Loyalty points stockpiling (i.e., delaying redemption of points when an opportunity presents) is a pervasive phenomenon (Stourm, Bradlow, and Fader 2015). We adopt construal level theory (CLT) (Liberman and Trope 1998) to study how points are construed vis-à-vis money: either concretely (low construal) or abstractly (high construal), and how such construals affect loyalty points spending and stockpiling behavior.

We propose that money and loyalty points vary in how consumers construe them. As the level of direct experience with money (vs. points) is high (vs. low); money is (vs. points are) viewed concretely (vs. abstractly).

Prediction 1. CLT research demonstrates that when people construe targets at a high (vs. low) level, greater weight is given to desirability (vs. feasibility) aspects of the target (Liberman and Trope 1998). Given that points are construed at a higher abstract level, people should prefer to spend points on more desirable products. Conversely, people should prefer to spend the low construal concrete money on more feasible products.

Prediction 2. Given that, loyalty points evoke abstract construals and such construals drive an emphasis on desirability, when spending points, the preference should be to redeem points on a highly desirable version of the product that points can buy. In the pursuit of a highly desirable version of a product, it is likely, that people will procrastinate spending points to a later date, if the redemption available later is more desirable, thus causing stockpiling.

Prediction 3. Loyalty-points currencies may be relatively concrete (money-like) in nature or abstract (non-money) like. It logically follows that people will spend loyalty points that are similar to (different from) money similarly (differently). Integrating this argument with the argument preceding prediction 2, we should expect that all else equal, when spending concrete (vs. abstract) loyalty points, people will be less (vs. more) focused on spending the loyalty points on a highly desirable product and thus less (vs. more) likely to stockpile.

We present three studies that empirically tested these predictions.

Study 1 was an (Mturk) experiment with a two (redemption variation attribute: desirability vs. feasibility) x two (level: high vs. low) mixed design with ten product replicates. The dependent variable was whether participants preferred to use their loyalty points or money for purchasing the product. Analysis based on a linear mixed effects model revealed a significant attribute x level interaction. The interaction was such that participants preferred to spend loyalty points on more desirable products vis-à-vis less desirable products. Conversely, people preferred to spend money on more feasible products relative to less feasible products.

Study 2 was an (Prolific) experiment with two between-subjects conditions (money and loyalty points). In each condition, participants evaluated ten redemption two-option choice sets. For each trial, Option A represented a basic object or experience. Option B represented a more desirable version of the same object or experience, but available after a delay. The dependent variable was how likely participants were to choose Option B over Option A. Analysis shows that people were more likely to *delay* spending for a more desirable redemption in the points condition than in the money condition.

Finally, Study 3 (Qualtrics panel) tested whether the tendency to stockpile loyalty points will be lower for concrete (vs. abstract) loyalty points. Participants imagined that they had an opportunity to spend their concrete (vs. abstract) loyalty points to acquire ten products. Analysis revealed that participants in the concrete (vs. abstract) currency condition were more likely to spend their loyalty points.

To conclude, we find that consumers prefer to spend loyalty points (vs. money) on products that are more desirable (vs. feasible). In addition, unlike when spending money, consumers tend to stockpile points to acquire a more desirable redemption in the future. We also show that the tendency to stockpile points can be overcome by manipulating the properties of the loyalty points currency that render it abstract or concrete.

Would a Mature Person Share Their Attitudes?
Cultural Differences in Attitude Expression

Aaron J. Barnes, University of Louisville, USA
Hao Shen, Chinese University of Hong Kong, China
Sharon Shavitt, University of Illinois at Urbana-Champaign, USA

EXTENDED ABSTRACT

Is sharing your personal attitudes considered a hallmark of maturity, or a sign of immaturity? Marketers strive to understand what shapes consumer attitude expression. We propose that one driver is whether one sees attitude expression as a *mature* thing to do.

Maturity reflects greater adaptiveness to others as well as increased confidence in one's abilities (Helson and Wink 1987; Hunt 1941). In the context of differences of opinion, one's dominant perception of maturity can lead to different outcomes. If maturity emphasizes adaptiveness to others, then a mature individual should resist expressing their own opinions when others disagree with their position. Suppressing personal opinions in this setting could allow the group to continue functioning harmoniously and avoid potential conflict. In contrast, if maturity emphasizes confidence in one's abilities, then a mature individual should express their opinions when others disagree with their position. Expressing personal opinions in this setting could showcase the individual's ability to be independent and influence others.

We suggest that cultural differences provide a basis to predict different patterns of opinion expression as a function of maturity (Markus and Kitayama 1991; Riemer et al. 2014). In Eastern cultural contexts (e.g., China), people emphasize conformity (Kim and Markus 1999) and adjustment to others' needs (Morling, Kitayama, and Miyamoto 2002; Savani, Morris, and Naidu 2012). People in Eastern cultural contexts may therefore perceive a mature individual as one who resists self-expression when others disagree with their personal views. In contrast, in Western cultural contexts (e.g., the United States), people emphasize self-expression (Kim and Sherman 2007; Savani, Markus, and Conner 2008) influencing others (Morling et al. 2002), and personal agency (Savani et al. 2010). People in Western cultural contexts may therefore perceive a mature individual as one who can express themselves when others disagree with their personal views.

In Study 1 (N=169), Chinese and U.S. online panelists indicated whether they preferred Apple or Samsung cell phones, or had no preference between the two. Next, they imagined a dinner where their classmates expressed a preference for the other, dispreferred phone brand. Participants were randomly assigned to think about whether a mature (vs. immature) person would state their preference in such a situation (1 = *definitely no*, 7 = *definitely yes*). As expected, the analysis revealed a maturity × culture interaction on the predicted reaction to the situation. ($F(1, 165) = 12.42$, $p < .001$). In particular, American participants predicted a mature (vs. immature) person is more likely to express their own preference. In contrast, Chinese participants predicted a mature (vs. immature) person is less likely to express their own preference.

In Study 2 (N=203), Chinese and U.S. participants were randomly assigned to either compare their level of maturity to new students (vs. alumni) at their university. Then, they indicated the extent to which they would express or inhibit (reverse-coded) their true self in public. Both items were measured along a scale from 1 (not at all) to 7 (very much), and were averaged to create a self-expression index ($r = .42$). As expected, we observed a culture × maturity interaction on rated likelihood of self-expression ($F(1, 176) = 7.85$, $p < .01$). American participants were marginally more likely to self-express when they were primed to feel more (vs. less) mature. In contrast, Chinese participants were significantly less likely to self-express when they were primed to feel more (vs. less) mature.

In Study 3 (N=208), undergraduates from the same U.S. university participated in a 2 (ethnicity: European American vs. Asian) × 2 (primed maturity: high vs. control; between-subjects) × 2 (preference incongruity: incongruent vs. control; within-subjects) experiment. Participants indicated their preference between cell phones as in study 1 and also, as a control preference, between GE and Phillips light bulbs. For each category, participants then wrote a short paragraph about the brand they preferred. Then, participants in the maturity prime condition read that we were interested in what a mature person would say when they meet one of their peers, whereas those in the control condition did not see this information. Participants were then assigned to communicate with a partner who preferred their dispreferred cell phone brand. We measured participants' desire to share their preferences by asking them how much they wanted to share each of their phone and bulb paragraphs they wrote before, rated separately from 1 (definitely do not share this paragraph) to 7 (definitely share this paragraph). We computed a relative preference expression index by subtracting the control preference rating (bulbs) from the incongruent preference rating (phones). As expected, an ethnicity × maturity ANOVA on relative preference expression revealed a 2-way interaction ($F(1, 204) = 7.61$, $p = .006$). European Americans were directionally, but not significantly, more willing to share an incongruent preference when maturity was primed (vs. not). In contrast, Asians were significantly less willing to share an incongruent preference when maturity was primed (vs. not).

In Study 4 (N=254), online panelists participated in a 2 (culture: U.S. vs. Hong Kong) × 2 (primed maturity vs. immaturity) between-subjects design. Participants considered two people. Person A was 40 years old (maturity prime) and person B was 20 years old (immaturity prime); age order was counterbalanced. Then, participants predicted which person was more likely to express or inhibit (reverse-coded) their true self in public. These items were measured on 11-point scales (-5 = *definitely person A*, 5 = *definitely person B*). As expected, a culture × primed maturity interaction emerged on perceived self-expression ($F(1, 250) = 14.38$, $p < .001$). American participants reported that the more (vs. less) mature person would express their true self. In contrast, Chinese participants reported that the more (vs. less) mature person would inhibit their true self.

Our research contributes to the understanding of culture, attitudes, social influence, and word of mouth by providing insights into how culture shapes the meaning of maturity and how culturally distinct concepts of maturity influence consumers' attitude expression when others disagree.

Consumer Responsibility and Organizational Ethical Behavior:
The Normalization of Abusive Sales Practices in Financial Institutions

Roberta Gabriela Basílio, ESPM, Brazil
Rafaela Almeida Cordeiro, ESPM, Brazil
Mateus Canniatti Ponchio, ESPM, Brazil

EXTENDED ABSTRACT

In this study, we use a transformative service research perspective to investigate financial services according to both consumers' and bank employees' perceptions. Our analyses are based on the concepts of consumer responsibility (freedom of choice in the marketplace and the ability to exert that choice; Bhattacharjee, Berger, and Menon 2014) and ethical behavior in organizations (a pattern of behaviors following an organization's code of conduct or business principles; Fichter 2018). We shed light on the following questions: (1) How do bank employees apply consumer responsibility discourse to justify self-interested sales practices? (2) What kind of tension is there in the arguments presented by consumers and bank employees? (3) How is it possible to enhance consumer agency and develop a culture of ethical behavior and sales practices in financial services?

We conducted interviews with 12 bank employees and six bank customers. The bank employees held different positions prior to or at the moment of their interview for this study (frontline, middle and upper management, and organizational ombudsman) in three out of the five largest Brazilian retail banks. The consumers interviewed were customers of the five largest banks in the country. All interviews were conducted individually, recorded, and transcribed verbatim, and ranged from 15 to 99 minutes in length, comprising a data set of 76,634 words.

Our analysis followed a hermeneutic framework (Thompson 1997) to explore the meanings that the informants ascribed to their experiences with financial services. First, the interviews were separated into groups of bank employees and bank customers; each interview was read individually so that the authors could familiarize themselves with the data and obtain the first insights. Next, the interviews of each group were analyzed together with the objective of identifying themes and response patterns for bank employees and bank customers. Thereafter, a comparative analysis was conducted between the interviews of the two groups of informants, identifying tensions in their perceptions about financial services. The process was interactive and was repeated several times by the authors.

Our findings have indicated that banks sell the idea of ideal solutions and better benefits for their customers, yet in practice, employees follow the culture of selling the best product to make profit. Self-interested sales practices are encouraged by managers and are rewarded for the financial results they bring in the short term. Punishments for unethical behavior are rare, and there is no reward for ethical behavior, eliminating the possibility of reflecting on the ethical dilemmas experienced in organizations (Hill and Rapp 2014; Nicol 2018). Thereby, the vicious circle of self-interested practices is reinforced in financial institutions.

We have demonstrated that normalizing self-interested sales practices causes employees to blame customers for financial decisions and their consequences, especially when they bring negative results. When they realize that they have failed the customer, they blame the "system," something abstract and impersonal. Thus, we have noted that employees do not feel responsible for building a context in which consumers can safely exercise their freedom of choice (Anderson et al. 2016; Sirgy, Lee and Yu 2011). This perception is shared by consumers, who say that the big villain is "the bank" and not "the people who work in it," as the latter merely follow the rules of the game.

Our analysis has also revealed that a relationship based on trust is fundamental to a service that offers benefits to both customers and banks. We have noted that employees who answer questions and provide accurate and transparent information establish relationships of trust with their customers. Through such behavior, employees are viewed as experts, and customers trust their guidance, increasing customer trust. The customer who trusts the employee rewards good service through new transactions, contributing to the bank's financial results. However, although opportunistic behavior is not expected from the trusted salesperson (Guenzi and Georges 2010), there is the possibility of using consumer trust to work in the bank's interests over those of their customers.

We present practical ideas concerning how to enhance consumer agency and develop a culture of ethical behavior and sales practices in financial services, specifically by: providing accurate and transparent information to customers; guiding consumers on how to use the benefits that the purchased products offer; promoting financial education programs adapted to customers' realities; applying a bottom-up approach when developing codes of ethical conduct; rewarding ethical behavior; and promoting empathy for the customer through financial education for employees.

This study makes novel contributions. First, we present both consumers' and bank employees' perspectives toward financial services and their consequences, in response to recent calls for research focusing on contextual factors (such as market aspects) that affect consumers' financial well-being and collective attitudes regarding financial services (e.g., Brüggen et al. 2017; O'Connor et al. 2019). Second, by demonstrating how self-interested sales practices are normalized in financial institutions, we shed new light on how employees shape and are shaped by their environment and contribute knowledge to the literature on expert services and consumer responsibility. Third, we offer insights for actions to enhance consumer agency and develop a culture of ethical behavior in financial institutions, thereby responding to the call for investigations into how consumer sovereignty might be enhanced.

Future research should investigate consumer agency in the context of financial technology and digital financial services. In the context of financial services, does technology minimize or accentuate self-interested sales practices? Does the consumer feel more confident making his or her decisions without human intermediation? We also encourage new research to identify the underlying conditions that enhance consumer agency in financial services in diverse cultural contexts, as it is known that financial decisions are also influenced by socio-cultural aspects (Cordeiro, Wong, and Ponchio 2019; Peñaloza and Barnhart 2011).

Can Brands be Sarcastic? The Effect of Sarcastic Responses on Attitudes Towards Activist Messages

Juliana M. Batista, FGV/EAESP, Brazil
Lucia S. G. Barros, FGV/EAESP, Brazil
Fabricia V. Peixoto, FGV/EAESP, Brazil
Delane Botelho, FGV/EAESP, Brazil

EXTENDED ABSTRACT

Companies have been increasingly taking steps to address relevant societal concerns through brand activism, a business effort to promote, impede, or direct social, political, economic, and/or environmental issues in society (Sarkar and Kotler 2018). For example, Adidas used a same-sex couple in its Valentine day's ad, and Diesel's ad message says "Make love, not walls." Those issues are mostly controversial, which may make some consumers feel dissatisfied or offended, responding on social media platforms using uncivil comments (Ziegele and Jost 2016). Some brands, such as Avon, have reacted to these consumers by using a formal and explanatory tone, while others, such as Adidas, have used sarcasm, a type of aggressive humor in which statements carry a meaning that differs to its literal version to criticize someone (Filik et al. 2016). However, because of sarcasm's dubious characteristic (aggressive and humorous), it is unclear whether a sarcastic response is likely to elicit positive affect, regardless of the situation. The literature is dubious on that: while in some circumstances individuals see sarcastic insults as funnier (Dews et al.1995), more unexpected (Lagerwerf 2007), more memorable (Gibbs 1986), and more polite than direct insults (Filik et al. 2016), there is evidence that people dislike a message when it is aggressive (Cann et al. 2016).

Although some brands are using a sarcastic tone in social media, we posit that activist brands should not respond sarcastically to consumers due to the following reasons. First, most studies that found positive evaluations for sarcasm have compared it to direct insults, not to non-insulting forms of communication (Filik et al. 2016, Pexman and Olineck 2002). When the alternative option is a constructive language, the aggressiveness characteristic of sarcasm may harm consumers' attitude towards the brand (hereafter ATB). Second, controversial issues are those not well settled in society (Levinson 2006), so opinions in favor or against them are appropriate, making aggressiveness against any side perceived as offensive (Kuipers 2015). Finally, individuals, in general, do not like aggressive humor when it is targeted to a specific person instead of people in general (Warren and McGraw 2016).

We designed six online experiments to test our rationale. Study 1A examined whether a type of response (sarcastic vs. explanatory) of an anonymous brand to an uncivil comment would be perceived as aggressive, and negatively influence ATB. Participants (n=1027) from an online panel saw an anonymous internet user's comment replying to a brand's opinion against LGBT phobia, in the brand's Facebook page. Participants in the sarcastic condition significantly perceived the response as higher in aggressiveness than participants in the explanatory condition, and participants' ATB was more positive when they saw the explanatory response than when they saw the sarcastic one. The effect of the type of response on the ATB is fully mediated by the perceived aggressiveness of the brand response (indirect effect= -0.2432; CI [-0.3729, -0.1224]). Study 1B replicated 1A with a fictitious brand (n=156), with similar results. Study 1C extends the investigation to another brand activism context: sexism. Participants (n=229) perceived the sarcastic response as more aggressive than the explanatory response, and their ATB was less positive when they saw the sarcastic response when compared to the explanatory one. The indirect effect 0.2277 (CI [.0847, .4387]) indicated full mediation of perceived aggressiveness of the brand response on the effect of the type of response on the ATB. Those studies provide evidence, in different contexts, that sarcasm makes consumers see brands in a less favorable light when compared to an explanatory tone. The underlying mechanism is, at least in part, the perceived aggressiveness of the message.

Study 2 examined whether the perception of aggressiveness in the consumer comment moderates the effect of each type of brand response on customer ATB. Participants (n=614) were randomly assigned to one of the four conditions: response type (sarcastic vs. explanatory) and internet user's aggressiveness (high vs. low). We used the same procedures as previous studies. ATB was more positive when participants saw the explanatory responses, as compared to the sarcastic ones. Participants also better evaluated the brand message when the Internet User's response was aggressive than when it was neutral, but we did not find any interaction effect.

Study 3 examined whether a less aggressive sarcastic response would result in customer ATB similar to that evoked by the explanatory response. Procedures were similar to the experiment 1A (n=216). When responses (sarcastic or explanatory) are less aggressive ATB was not significant. Results provided additional evidence that aggressiveness is a key mechanism in making individuals discontent with brands that reply to customers sarcastically.

Study 4 investigates whether aggressiveness is the causal mechanism for the higher ATB of the explanatory over the sarcastic response (n=394). We found a significant interaction (F(1, 390)= 4.32, p= 0.038), in a way that participants saw the brand in a more positive light when the sarcastic response was less aggressive, while no differences appeared for the explanatory response, suggesting that aggressiveness per se cannot explain why explanatory messages have better outputs. If a message is aggressive, but not humorous, participants see it as equally positive than if it is not aggressive, but equally not humorous. However, if a message is humorous, then participants see it in a more positive light when it is less aggressive. So, humor and aggression, which define sarcasm, should not come together in brand communication.

Our findings contribute to the literature by shedding light on the impact of message tones brands use to respond to uncivil consumer comments in the context of brand activism. Moreover, we contribute to the humor literature by showing a new situation in which the use of humor hurts brands instead of helping them. We show that sarcasm should be avoided in online communication not only because people expect factual information from some sources but also because they see sarcasm as inappropriate, hurting positive ATB. Finally, we show that sarcasm backfires activist actions: when communicating about a controversial issue, brands should evaluate messages tone even when interacting with consumers who agree with the brand's opinion on the issue.

Interpersonal Relationships as "Self-otherhood": A Conceptualization and Demonstration in the Context of the P2P Sharing Economy

Russell W. Belk, York University, Canada
Jashim Khan, University of Surrey. UK

EXTENDED ABSTRACT

Encounters with others may produce meaningful relationships or may create disparities in the meanings derived by the individuals involved. Our focus is on the relationships formed on peer-to-peer accommodation platforms, such as those for Couchsurfing and Airbnb. Potential hosts and guests pursue self-presentations on these platforms. The motivation for self-presentation involves a desire to please through a version of the presenter's ideal self (Baumeister 1982), social self, or anticipatory self (Hearn 2017).

Peer-to-peer accommodations present opportunities for self-fulfilment, enjoyment, monetary benefits, accommodation, amenities and the need for socialization (Tussyadiah 2016). These benefits are intricately intermeshed. But initially the host and guest meet on an internet website. Here their self-presentations take the form of personal profiles – conveying information about jobs, demographics, hobbies, and heroes. They often include visuals: photos of self, family, pets, and homes. Host and guest design their self-presentations independently. Studies have explored the topic of self-marketing on personal web pages and various social media platforms (e.g., Kim and Tussyadiah 2013; Hearn 2017; Kim and Lee 2011; Schau and Gilly 2003). While these studies are beneficial in understanding self-branding, dating and hook-up apps, and web pages, they may be less useful for understanding host-guest interactions on P2P accommodation-sharing sites.

Drawing on the Ronald Laing's *Knots* (1970) and Goffman's presentation of self (1956), this research challenges the view of shared cognition and feelings of consistency/inconsistency between individuals. It is likely that hosts and guests create their own individual imagined relationships construed as friends, commercial partners, or even adversaries.

Relational Self-Otherhood

We study Couchsurfing self-presentations online as a "dance" between camaraderie, marketplace exchange, and conflict. In order to understand this dance, we develop the concept of relational self-otherhood. This involves *the bundle of memories, emotions, cognitions, and bodily sensations regarding the relationship*. Both the host and guest have such construals of their relationship and they are necessarily at least somewhat incongruent. Often, they are predicated on an imagination of the other's relational self-otherhood. This is perhaps best illustrated an excerpt from Laing's (1970, 48) *Knots*:

> *She wants him to want her*
> *He wants her to want him To get him to want her*
> *She pretends she wants him To get her to want him*
> *He pretends he wants her*

First Impressions and Prejudices

Camaraderie, whether sincere or insincere, is the preferred mode of relationship on Couchsurfing. Online profiles provide a basis for first impressions and the dance begins in subsequent online exchanges. In technology-mediated relations of peer-to-peer accommodations, the construals of the relational self-other image are interdependent, but strongly guided by first impressions. These impressions may be influenced by personality, occupation, nationality, age, ethnicity, gender, attractiveness, and apparent income and social class. There is ample opportunity for racism, sexism, ageism and other forms of bias and prejudice to enter into these first impressions. But the host's and guest's imagined self-otherhood is more likely to proceed beyond this first impression if there is anticipated comradery.

Masks and Selves

We are comprised of all the "masks" we wear on different occasion (Brissett and Edgley 2005; Goffman 1956). Peer-to-peer accommodation platforms function to help each party design self-presentations or "masks." The mask helps us to project our best self in a given situation like interacting on the Couchsurfing platform. For potential hosts, having formulated an attractive profile self-presentation, we continue to put our best face forward in sending messages in response to potential guest inquiries. Mutual self-disclosures can help to build pre-visit comradery or may raise flags of conflict. Aesthetic, political, ethical or other differences may either be ignored, challenged, or sabotage the relationship and bring it to an end.

When host's and guest's self-otherhoods are dissimilar, but the difference is ignored this involves what we call a subdued self. Subdued self an alternative self to avoid conflict. It is achieved by hiding or subduing aspects of self that are likely to provoke or expose a conflict situation. Either or both members of the dyad may do this. The relationship between host and guest is likely to be more passive, professional and pro-forma in nature than it might otherwise be if the participants were truly the friends they are pretending to be. If, for example, they perceive a likely ideological difference, they try to avoid conversations that would surface the conflict. Some might even appear to go along with beliefs that they would normally oppose.

Face-to-Face Interactions and their Aftermath

Experiences during the stay continue the dance and influence both actors, Host and guest post-visit activity takes the form of posting comments, pictures, likes and dislikes as part of a mutual reputation rating system. With the greater distance they may be more forthright, especially if the experience was positive. They may however continue to portray a negative experience as positive, with a subdued self and a lack of candor about differences with the other. In this case they jointly co-create a surface-level, often fictional, image of a co-constructed shared self-otherhood. We often do this in person as well through through polite fictions, civil inattention, and studied non-observance (Goffman 1967).

Peer-to-peer social media platforms for Airbnb or Couchsurfing often act as repositories for selfie culture (Goss 2019; Gorichanaz 2019) as a way to communicate self-otherhood among platform members, specifically when they portray the host and guest in a recent stay. When the imagined self-otherhoods are similar between host and guest, this results in co-created relational self-otherhood. Similar perceptions should heighten the

perceived warmth of the relationship and the feeling of camaraderie. On the other hand, dissimilar self-other experiences will lead to felt conflict, frustration and perhaps a subdued self for either one or both of the agents in order not to provoke a confrontation in person or later online.

We find that these relationships are most likely to be implicitly negotiated between members of the pair. We explore this topography through a series of encounters involving both disputes and harmony. In this exploration we consider self-presentations (before) and self-re-presentations (after) host-guest contact using ethnographic and netnographic research.

Ronald Laing's Knots

As noted above, Ronald Laing's *Knots* outlines how two persons develop their relationship in a potentially conflicting situation. The idea that people tend to assume what other people are thinking about them may be the root to misunderstanding in a relationship. This is most likely be the case when two strangers meet and try to develop a relationship with each other. In order to pursue a relationship one or both parties may recognize initial insincerity but still persevere to realize co-orientation. Their initial interaction takes place within the larger rubric of a game:

They are playing a game. They are playing at not playing a game. If I show them I see they are, I shall break the rules and they will punish me.

I must play their game, of not seeing I see the game. (Laing 1970, 1) Misunderstandings, by one or both agents, may interrupt bonding in a relationship. The relational self between guest and host is disrupted if either one or both misunderstand that the relationship is a fictive pretence. The premise is that people may knowingly or unknowingly participate in building relationships based on falsehoods. Laing focuses on the knots people tie themselves into through preconceptions and misunderstandings. He calls them "*knots, tangles, fankles, impasses, disjunctions, whirligogs, binds*" (Laing 1970, i). The relationships he deals with are those of parent and child, lovers, or peers. The bonds can be of love, dependency, uncertainty or jealousy. These sort of knots in relationships are also likely when two strangers meet online to determine whether they will pursue a further relationship. Even when insincerity or falsehood in a relationship is known to both parties, they may decide to play their role knowing that the relationship will end when the contractual stay is over. Such is the logic of "knots."

By expressly theorising self-otherhood in cases of dissimilarity, we allow for deeper reflection on the nature of peer-to-peer home-stays. We use separate interviews with both participants in Couchsurfing to focus on the subdued self.

A Priori and Logical Extension of Self Otherhood

The GUEST self-other and HOST self-other in relational self-otherhood are imagined separately. For example, both guest and host like drinking wine but one likes red wine and the other likes white wine. One may feign indifference in order to defer to the other's preference. In this simple case, one would perceive congruent preferences and the other incongruent preferences. Therefore, we focus on *imagined* rather than actual similarity/dissimilarity. Sometimes it is like mutually saluting a flag or two people both saying "I love you" to each other. These are things that should be taken at face value and not questioned. Otherwise the partners may discover that they mean quite different things to them and that they have different levels of sincerity in their relational self-otherhood. If the parties assume mutual sincerity, 'me' and 'you' transforms as 'we' and 'us.' This magical transmogrification results in an imagined 'self-otherhood' that two people in a relationship exemplify a shared self-otherhood. Peer-to-peer accommodations present a special case because the face-to-face encounter is for a fixed period of time. Departure does not entail a breakup or divorce.

Conclusion

In this on-going project, we propose that platform-mediated interactions create a 'relational' self-otherhood. A good positive experience for both host and guest entails harmony in the relationship providing the self-other of host and the self-other of guest with corresponding sentiments, emotions, thoughts and feelings. Like a ballroom dance, where male and female are in synchrony and lost within the moment, this can be an exalted flow state. This is an ideal outcome, but it does not occur most of the time; there are times when dissimilarity dominates expectations and experiences in either the host or guest domain. The relational self-other manifests in both host's and guest's minds. It is not just predicated on the shared experience of a visit, but also depends on their perceptions and imaginations of each other's performance and thoughts.

The relational self-otherhood concept differs from the simpler formulation of co-orientation. Laing's (1970) *Knots* insights highlight the need for a deeper understanding of the temporary or lasting merging of selves that takes place when strangers come together. We began our study online because of the digital affordances available on general and specialized social media. The behavioural phase currently underway examines actual Couchsurfing pairs and interviews them separately. Unlike other platforms like Airbnb, Couchsurfing has the advantage of being less mediated. Airbnb employs professional photographers, coaches, and local host coordinators, whereas Couchsurfing is largely free of such management. Furthermore, whereas Airbnb often involves couples and families as both hosts and guests, Couchsurfing most often involves two individuals. And the fact that no money changes hand in Couchsurfing takes away the possible ulterior motives of profit-seeking and bargain-hunting. This does not rule out other ulterior motives like learning, sex, or putting a guest to work on the host's home projects. But the absence of monetary considerations removes some obvious alternate explanations of cordial-seeming behaviors. This makes for a clearer opportunity for testing our a priori model.

Our study focuses on the intimacy of sharing a home or couch, but the model potentially applies to a variety of interpersonal encounters, including those between merchants and customers, business colleagues, friendship networks, and family members. The construct of self-otherhood offers a way to account for B2B, B2C and P2P relationships and hopes to broaden the field of relationship marketing. The concept of the subdued self is potentially relevant in all fields of consumer behavior studies.

What our perspective introduces to theoretical and methodological conversations is the issue of sincerity of performance. It recognizes that we are both performers and audience in our interactions with others. We also play the role of critic in that we evaluate the success and sincerity of the other's performance. We hope that we are opening a theoretical and methodological door for consumer researchers that will result in new insights and understandings.

What is Street Cred? An Exploration of Street Credibility in the Marketplace

Delancy Bennett, Clemson University, USA
Geraldo Matos, Roger Williams University, USA
Mitchell Hamilton, Loyola Marymount University, USA
Nicholas Pendarvis, California State University Los Angeles, USA

EXTENDED ABSTRACT

Introduction

Street cred is ubiquitous, and marketers leverage it to promote a wide array of products from music and Disney characters to cars, tea, candy and snacks. Indeed, Podoshen (2008) suggests that street credible celebrities influence mainstream purchases, and Bennett et al. (2020) predicts that such celebrities will eventually replace athletes as the most influential product endorsers. Thus, for the general populous, street cred is real, salient, influential, and sought. But what exactly is street cred?

Webster's dictionary has loosely defined street cred as "the acceptance and respect of people who live in poor city neighborhoods," yet as we have demonstrated, it is used by populations beyond this culture. While anthropology, education, and sociology research suggests that street cred originates in the inner city, the social sciences have yet to define the construct or investigate its mainstream relevance. To bridge this gap, we offer an empirically based definition of street cred, an explanation of its uses, and an agenda for future research.

Methodology and Procedure

To define street cred, the primary investigator interviewed 60 students (age 18 to 22) from two U.S. communities. Subculture "members" (inner-city minority, n = 31, 16 male) were interviewed in Harlem, NY, an inner-city where street cred originates. To represent the broader population, subculture "nonmembers" (non-inner-city majority, n = 24, 9 male; and non-inner-city minorities, n = 5, 3 males) were interviewed at a college in New England. All interviews followed a semi-structured script focusing on what street cred is and why it is important. The interviews averaged an hour and fifteen minutes. After transcription, the primary investigator created a seven-page codebook. Using the codebook, interviews were coded in NVivo 10 by the primary investigator and two research assistants.

Results and Analysis

In aggregate, our findings result in the following empirically grounded definition:

Street credibility (street cred) is the cultural capital given to individuals from socioeconomically disadvantaged and dangerous origins who, through authentic experiences unique to these environments, have acquired street smarts and a tough persona. In their pursuit of independence and success, these individuals have navigated encounters and obstacles unique to street life that may include exposure to violence, the underground economy, and adherence to street codes.

Both traditionally defined credibility and cool belong to street cred's nomological network. Although street cred is not grounded in the traditional operationalization of expertise, trustworthiness, or attractiveness which reflect credibility (see Ohanian 1990), it still falls within the same nomological network as it illustrates a useful and desired yet distant and distinct form of credibility. We find that street cred and cool are not mutually inclusive as respondents from both groups identified celebrities who were both cool and had street cred (e.g., Snoop Dogg), did not have street cred but were cool (e.g., Drake), or had street cred but were not cool (e.g., Suge Knight). While street cred is expressly determined by where one comes from and what one has seen and understands, cool has morphed over time to reflect a multitude of meanings, including the ability of an individual to maintain a state of detachment or nonchalance (Moore 2004). Still cool and street cred have some overlap: notably cool also has inner-city roots (Nancarrow and Nancarrow 2002), and it reflects a sense of "knowingness," insider access to information that one is, in some sense, privileged to have (Moore 2004). We find that for nonmembers, holding a knowingness of what street cred is and who has it signals that they are in the know of what is current and trending and adds to one's coolness and popular culture capital.

Discussion

Street cred can be conceptualized as representing a unique form of embodied cultural capital. From a theory of practice perspective, we argue that it represents a set of interrelated capabilities, understandings, and discourses that emerge from the poor inner-city neighborhoods where resources are scarce and employment in the underground economy is prevalent (Bennett et al. 2020). Our respondents indicated a perceived criminal history might authenticate such origins, providing a testament to one's street smarts and toughness. Thus, what is often stigmatized may instead serve as proof of authenticity here. As poor and dangerous neighborhoods and the pursuit of independence and success are not restricted to the United States, street cred, and its importance within and outside of the subculture may be universal.

In its true, pure, and highest form, this cultural capital cannot be readily obtained by nonnatives of the street culture that produces it. Instead, it is reserved for people of specific origins and accomplishments. One cannot easily break into the caste system that has created street cred without falsifying one's credentials, which, in turn, illegitimizes the credibility being sought. From this perspective, individuals who acquire forms of cultural capital derive value by properly deploying it as they navigate social life in consumer subcultures where it is most relevant (Schau et al. 2009). In these spaces, the ability to embody street cred allows for the pursuit of status and enables one to identify both their position within the field's social hierarchy and that of others. Still street cred, as stated earlier, is used by populations well beyond that of the inner city. For example, a recent twitter search shows 78 million uses of the terms street credibility and street cred a six-month span.

The widespread use of the term as a consumer colloquialism (e.g., "this look enhances my street cred") may be employed ironically as a tongue-in-cheek expression, mimicking capital owned by others (e.g., Eminem's) or sardonically positioning one as street cred's polar opposite. Such use further suggest a "knowingness" of what street cred is among nonmembers. Nonmembers also use the term to reflect credibility without reference to the street subculture (i.e., "earning CPA will increase your street cred"). This misuse violates the knowingness, may be seen as "lame" by the subcultures members and nonmembers who are "in the know." Such use in advertisements may be harmful and should be avoided by marketers.

Conferring Minds to Machines: A Deep Learning Approach
to Mind Perception, Technology Attachment, and Trust

Anouk Bergner, University of St. Gallen, Switzerland
Jochen Hartmann, University of Hamburg, Germany
Christian Hildebrand, University of St. Gallen, Switzerland

EXTENDED ABSTRACT

Perceiving a mind in others is paramount to navigating the world around us. Thinking whether other entities possess a mind inspired research from interpersonal perception in humans (Gray, Gray, and Wegner 2007; Waytz et al. 2010)however, always ascribe minds to other people, and sometimes ascribe minds to non-people (e.g. God, gadgets to seminal court cases on human rights for animals (Premack and Woodruff 1978) and even to theological beliefs (Barrett and Keil 1996). The proliferation of AI-enabled technologies that appear increasingly more human-like, raises fundamental questions about the role and impact of mind perception in the consumer technology landscape. Anecdotal evidence suggests that consumer-object relationships may vary dramatically among consumers interacting with these devices (Hoffman and Novak 2018; Novak and Hoffman 2018). Uncovering this variability in mind perception and understanding the extent to which these differences in perceiving a mind reflects the underlying relationships between consumers and technology, as well as the downstream consequences of mind perception in non-human agents, are unanswered and fundamental questions.

The current work builds on theory of mind literature to classify the extent of mind consumers perceive in their smart objects. In this research, we explore the link between mind perception in cutting-edge humanized AI and downstream consequences on consumer attachment to, trust in, and evaluation of smart objects from unstructured customer review data. Using a large-scale panel of smart object users, we demonstrate that perceiving a mind in an AI-enabled object, such as a voice assistant, predicts customer product ratings, trust perceptions, and consumers' attachment to technology. Furthermore, in order to identify the extent of mind perception from unsolicited customer reviews, we leverage state-of-the-art transfer learning models (Devlin et al. 2019) to extract subtle cues from unstructured text. We develop an automated text classifier and demonstrate the accurate prediction of mind perception from unsolicited, unstructured customer reviews.

The study was designed to establish the importance of mind perception as a critical predictor of consumers' attachment to, trust in, and overall evaluation of a smart object, and to test whether an automated text classifier is able to predict mind perception unobtrusively from these unstructured customer reviews. A total of 810 active smart home assistant users were recruited from an online consumer panel (M_{age} = 36; 57.9% female). Participants were instructed to write an online review about their smart home assistant (e.g., on Amazon.com). After they completed the review, we assessed mind perception on 8 dimensions (adapted from Gray et al. 2007 α=.89). Furthermore, we assessed consumers' evaluation of, trust in, and attachment to their smart object as follows: First, participants were asked to assign a star rating to the smart assistant. Second, we assessed privacy concerns with a 3-item measure (Dinev and Hart 2004; α=.95). Third, we measured consumers' object attachment using a behavioral measure by asking consumers to indicate a value (in USD) to forgo using their assistant for one month (log-transformed due to skewed distribution).

In line with our hypothesis, a regression analysis confirms that greater mind perception leads to an increase in customer ratings (β=.58, *p*<.001), object attachment (β=.51, *p*<.001) and a decrease of consumer privacy concerns (β=-.34, *p*<.01). To quantify the effect sizes of the coefficients reported in the regression analysis, we ran a post-estimation analysis, predicting each dimension for customers who attribute higher vs. lower mind perception to their smart home assistant (using a median-split for illustrative purposes). Star ratings are 11% higher for customers with high mind perception (5.22 vs. 5.79), privacy concerns 7% lower, and customers with low mind perception expected lower compensation to forgo the use of their smart assistant $37.69 USD, while customers with high mind perception demanded $62.54 USD, an increase of 66%.

Based on the findings of this study, we build an automated text classifier to detect and predict consumers' degree of mind perception of their smart home assistants. We employ a transfer learning model to leverage knowledge outside the training data. Specifically, we fine-tune DistilBERT, a pre-trained state-of-the-art language model (Sanh et al. 2019). We formulate the mind perception prediction as a binary classification problem by median-splitting the data. Hence, the baseline accuracy is 50%. We train the language model for 10 runs, which yields and average accuracy of 62.60%, highlighting that unsolicited consumer reviews contain signals that can be used to understand a consumers' level of mind perception in an unobtrusive way and that goes beyond mere measures of consumer sentiment.

In this paper, we established a relationship between mind perception, consumer attachment to, trust in, and consumers' overall evaluation of smart objects. Specifically, we discovered a positive relationship between conferring minds to machines and customer ratings, a negative relationship to privacy concerns, and a greater extent of attachment to their smart objects. We used unstructured customer review data to train a state-of-the-art text classifier to accurately predict mind perception from these customer reviews. To the best of our knowledge, this is the first research developing a state-of-the-art text classifier to unobtrusively detect customers' perception of mental capacities in a non-human agent from unstructured text data and how differences in mind perception predict consumers' attachment to, trust in, and evaluation of consumers' smart objects.

Essence Slows the Rate of Hedonic Decline by Adding Meaning

Baler Bilgin, Koç University, Turkey
Cammy Crolic, University of Oxford, UK

EXTENDED ABSTRACT

Imagine buying a new painting for your office wall; you will enjoy it less as you are repeatedly exposed to it. Yet, periodically switching paintings is a costly solution. Hence, it is important for marketers to know whether certain factors can slow down hedonic decline, increasing the enjoyment consumers derive from experiences.

Hedonic decline is a decrease in responsiveness to hedonic stimuli meaning that positive experiences become less enjoyable with repeated exposure (Coombs and Avrunin 1977; Frederick and Loewenstein 1999; Galak and Redden 2018). It decreases when perceived variety increases (Epstein et al. 2009; Galak, Redden, and Kruger 2009), rate of consumption is slowed (Galak, Kruger, and Loewenstein 2013), and when consumption episodes are categorized more specifically (Redden 2008). Yet, hedonic decline is not physiological; it can be constructed in the moment (Galak and Redden 2018). Research has suggested that meaning making influences this construction process (O'Brien 2019; Yang and Galak 2015). Hedonic decline slows when each exposure provides an opportunity to make meaning. For example, when people see the same movie many times, they notice new things, form theories, and speculate, which are all acts of making more meaning with each consumption episode.

Importantly, we propose that essence can slow hedonic decline by enabling meaning making. People believe that objects acquire a special aura or "essence" from their past which affects the valuation of consumer products (Argo et al. 2008; Morales and Fitzsimons 2007; Newman and Dhar 2014) and original artworks (Newman and Bloom 2012). Perceived essence layers on non-physical elements and can add to the meaning of an object. This increases the potential meaning that can be extracted with each exposure. Accordingly, we hypothesize that hedonic decline will slow when people can use essence to make meaning. We further hypothesize that perceived essence will slow down hedonic decline when people use it to construct their own meaning of an object but not when they believe meaning is fixed. This is because while people can use perceived essence to construct meaning, it is irrelevant without a meaning construction process (i.e., belief that meaning is predetermined). In sum, we hypothesize that:

Hypothesis 1: *(a) Perceived essence slows hedonic decline (b) when people believe they can construct their own meaning but not when meaning is fixed*

Three studies support our predictions. Study 1 showed that greater perceived essence (i.e., an earlier serial number of an art print (2/30) versus a later serial number (27/30); Smith, Newman, and Dhar 2015) led to slower hedonic decline. 120 MTurkers were randomly assigned to either early or later serial number conditions. All participants looked at an art print labeled no. 02/30 or 27/30 for 15 seconds and then rated their enjoyment of the print (*0=Not at all, 100=Very much*). They viewed and rated it eight total times. A repeated-measures ANOVA revealed a significant interaction ($F(7, 826)=2.04$, $p=.047$). Two planned contrasts confirmed that the pattern of the interaction matched our theory. The first enjoyment rating did not differ between the two label number conditions ($M_{2/30}=60.15$ vs. $M_{27/30}=56.21$; $F<1$). However, the contrast on the final enjoyment rating indicated a significant difference ($M_{2/30}=48.97$ vs. $M_{27/30}=36.83$; $F(1, 118)=3.72$, $p=.05$), as predicted. Thus, greater perceived essence

from an earlier serial number led to a slower hedonic decline (i.e., a less steep slope) and supports H1a.

Study 2 replicated the key effect of essence slowing hedonic decline using a different manipulation of essence (i.e., geographic proximity: original production location versus new production location; Smith et al. 2015) of a song recording. It also showed that greater perceived essence slows hedonic decline by enhancing the meaning of the experience. 127 MTurkers were randomly assigned to either production in the original location condition or production in a newer location condition. All participants listened to a Beatles song produced in the original location in London or in a newer location in China for 30 seconds and then rated their enjoyment of the song eight times. Next, they indicated how much the song expressed something for them (*1=not much at all; 7=very much*), which measured meaning and served as the mediator. A repeated-measures ANOVA revealed a significant interaction ($F(7,875)=2.49$, $p=.016$). Two planned contrasts confirmed that the first enjoyment rating did not differ between conditions ($M_{original}=77.81$ vs. $M_{newer}=70.78$; $F(1,125)=2.34$, $p=.13$) but there was a significant difference on the final enjoyment rating ($M_{original}=61.10$ vs. $M_{newer}=40.38$; $F(1,125)=11.16$, $p=.001$). This result supports that greater essence (i.e., the original location) led to a slower rate of hedonic decline further supporting H1a. A one-factor ANOVA revealed that the original (vs. newer production) location expressed more meaning ($M_{original}=4.18$ vs. $M_{newer}=3.20$; $F(1,125)=7.14$, $p=.009$) and a mediation analysis (Model 4 with 10,000 resamples; Hayes 2018) revealed the indirect effect of production location through meaning was significant [-.35; *CI 95%*: -.71, -.08].

Study 3 replicated the key effect when participants were led to believe that meaning can be constructed but the effect disappeared when led to believe that meaning is fixed. We used the method from study 1 except prior to viewing the art, participants either read a blurb about how meaning is either constructed or fixed. 140 MTurkers were randomly assigned to one of four conditions of a 2 (number: 2/30 vs. 27/30) x 2 (meaning: fixed vs. constructed) x 8 (viewings) design. There was an overall interaction ($F(7,928)=2.28$, $p=.026$). When participants believed meaning is constructed by the perceiver, the results replicated the previous studies. There was a significant interaction ($F(7,482)=3.77$, $p=.0005$) and planned contrasts confirmed the first enjoyment rating did not differ ($M_{2/30}=64.93$ vs. $M_{27/30}=57.55$; $F(1,70)=1.95$, $p=.17$) but the final enjoyment did ($M_{2/30}=57.40$ vs. $M_{27/30}=33.21$; $F(1,70)=11.88$, $p=.001$) between conditions. Yet when meaning is fixed, the results support our theory that meaning making underlies our effects. The interaction was not significant ($F<1$). The lack of an interaction shows that limiting the opportunity to make meaning reduced the impact of perceived essence on hedonic decline. Thus, when people are led to believe that they can construct their own meaning essence slows hedonic decline but not when it is fixed, consistent with H1b.

Perceived Social Presence of Anthropomorphized Chatbots

Miriam Biller, University of Mannheim, Germany
Elisa Konya-Baumbach, University of Mannheim, Germany
Sabine Kuester, University of Mannheim, Germany
Sergej von Janda, University of Mannheim, Germany

EXTENDED ABSTRACT

More and more companies use chatbots instead of human employees as a more time and cost efficient way to interact with customers (Kannan and Bernoff 2019). Chatbots are computer programs based on natural language designed to approximate written or oral human speech in an interaction mediated by a digital interface (Thomaz et al. 2020). The design of a chatbot can impact the customer experience during an interaction (Huang and Rust 2018). For example, chatbots can be equipped with human-like characteristics. Imbuing non-human entities "with human-like characteristics, motivations, intentions and emotions" is defined as anthropomorphism (Epley, Waytz, and Cacioppo 2007, p. 864). While prior research has generated some understanding of the effectiveness of product and brand anthropomorphism, there is a lack of research on the effectiveness of chatbot anthropomorphism. Even if no other real person is present, human-like attributes might spark feelings of social presence (Van Doorn et al. 2017). Social presence refers to an individual's subjective perception that another person or entity is present (Biocca 1997).

The present research proposes that chatbot anthropomorphism positively influences customers' perceived social presence in customer-chatbot interactions. Social presence, in turn, is assumed to positively influence customer-related outcomes, hence, mediating the effect of chatbot anthropomorphism on customer-related outcomes. Additionally, this research assesses whether these assumptions hold in both a pre-purchase and a post-purchase context. Furthermore, this research explores whether the effect of social presence on customer-related outcomes is contingent on whether customers have a hedonic or utilitarian shopping motivation and on whether the shopping situation involves sensitive information or not.

The present research comprises four individual studies. Studies 1, 2 and 3 were set up in a pre-purchase context whereas Study 4 took place in a post-purchase context. Study 1 is a 2 (chatbot anthropomorphism: no vs. yes) x 1 experiment in the context of online wine shopping with 275 individuals from a commercial consumer panel. In line with prior research (e.g., Aggarwal and McGill 2007), anthropomorphism was manipulated by using first vs. third person descriptions in the chatbot introduction. First, participants were introduced to the scenario experiment and subsequently saw an interaction with the chatbot in the form of screenshots. Study 2 (N=247) used the same procedure as in study 1, with three differences. We changed the scenario to the context of book shopping, additionally manipulated the shopping context (i.e., utilitarian versus hedonic book shopping) and analyzed two additional outcomes – word of mouth and satisfaction with the shopping experience. Study 3 (N=510) is a 2 (chatbot anthropomorphism: no vs. yes) x 2 (shopping information: non-sensitive vs. sensitive) experiment. Participants in the non-sensitive shopping information condition were instructed to shop for a remedy for colds while participants in the sensitive shopping information condition were instructed to shop for a libido increase drug.

The results of study 1 indicate that chatbot anthropomorphism positively influences trust and purchase intention. The analyses of study 2 and study 3 validate the findings of study 1 for the additional customer-related outcomes word of mouth and satisfaction with the shopping experience. We conducted mediation analyses for the two outcomes in study 1 and moderated mediation analyses (Preacher and Hayes 2004) for the four outcome variables trust, purchase intention, word of mouth, and satisfaction with the shopping experience in study 2 and 3. All analyses yielded the same pattern of results. First, the total effects of chatbot anthropomorphism on the outcome variables are significant and turn non-significant when social presence is added to the equation as a mediator. Second, the indirect effects of chatbot anthropomorphism on the respective customer-related outcomes via social presence are positive and significant. Thus, the mediation analyses provide evidence for a full mediation (Zhao, Lynch, and Chen 2010). The results of study 2 indicate no significant differences between the effectiveness of chatbot anthropomorphism in utilitarian versus hedonic shopping contexts. Further, the results of study 3 indicate no significant differences between the effectiveness of chatbot anthropomorphism in sensitive versus non-sensitive shopping information contexts. Hence, the positive effect of chatbot anthropomorphism on customer-related outcomes seems to be robust and does not seem to be contingent on neither the shopping context (utilitarian versus hedonic) nor the shopping information (non-sensitive vs. sensitive).

In study 4 (N=283) we adapted the scenario to the post-purchase context and applied a similar chatbot anthropomorphism manipulation as in the preceding studies. Participants were told that they already bought a case of wine after having been advised by the winebot. However, upon delivery they had to detect that four of the six bottles of wine had a cork taint. Therefore, they were angry and approached the winebot again with a complaint. We included the same customer-related outcomes as in Studies 2 and 3. The results indicate that chatbot anthropomorphism does not influence customer-related outcomes in the context of a post-purchase complaint. All indirect effects of chatbot anthropomorphism on the respective customer-related outcomes via social presence are non-significant. Furthermore, the total effects of chatbot anthropomorphism on the outcome variables are non-significant. Additionally, except for trust, there is no significant direct effect of anthropomorphism on the outcome variables. Hence, the findings illustrate a boundary condition of the positive effect of chatbot anthropomorphism on customer-related outcomes, which calls for further research.

Our research contributes to the literature on anthropomorphism, social presence, and chatbots. We extend the anthropomorphism research to the context of chatbots and provide evidence for a variety of important customer-related outcomes in customer-chatbot interactions. Furthermore, we add to the literature on antecedents and consequences of social presence by demonstrating that social presence is the underlying mechanism that accounts for the effectiveness of chatbot anthropomorphism. Additionally, we extend prior research by showing that social presence of chatbots positively influences customers' trust, purchase intention, word of mouth, and satisfaction with the shopping experience while not being contingent on hedonic versus utilitarian shopping contexts as well as sensitive versus non-sensitive shopping information. Finally, we gather first evidence that anthropomorphized chatbots only seem to be beneficial in the pre-purchase stage and not in the post-purchase stage.

Managing Customers' Imagination: Antecedents and Effects of Anticipated Surprises

Severin Friedrich Bischof, Copenhagen Business School, Denmark
Tim M. Boettger, IESEG School of Management, France
Thomas Rudolph, University of St. Gallen, Switzerland
Donald Lehmann, Columbia University, USA

EXTENDED ABSTRACT

Summary

This research aims to examine anticipated surprises, which we define as the deliberate purchase and anticipation of surprise items. While the literature has addressed the workings of unexpected surprises, it has not yet touched upon the anticipatory aspect of consumers expecting a surprise. Surprise subscriptions in retail embody the concept of anticipated surprises, as these subscriptions ship recurring boxes containing items chosen solely by the subscription provider. We apply the music-based ITPRA theory to pursue an analysis of the antecedents of anticipated surprise. Our results suggest that shoppers only pleasantly anticipate a surprise in case of bounded possibility realms. Prompting consumers to imagine the eventual surprise increases tension by limiting vagueness and thereby summons feelings of pleasant anticipation. This research utilizes experimental and field data to surface important implications for researchers in terms of a universal theory of anticipation.

Introduction

Surprise purchases, as offered by today's surprise subscriptions (e.g., Try the World, FabFitFun, StitchFix), represent valuable objects for scientific observation, as they are a white space within the academic literature. Existing surprise-related research did not address surprise as a retail mechanism, but only as the over- or under-fulfillment of expectations in the moment of consuming a product (Mano and Oliver 1993; Oliver and DeSarbo 1989; Oliver, Rust, and Varki 1997). Anticipation, due to its many facets in both expected and unexpected surprise situations, characterizes an important dimension of this phenomenon. We add to this by expanding surprise-related theories towards surprise as a manipulation rather than an outcome or dependent variable of consumption processes.

Hypothesis Development:

H1

Based on the research gap of surprise as a retail mechanism, this project explores surprise subscriptions of consumer goods. Subscribers purchase recurring deliveries of surprise packages, deriving value from two procedural factors: anticipating the delivery and experiencing surprise upon unpacking. Anticipation Theory states that savoring, i.e., the process of waiting for a positively valenced experience, such as the prospect of receiving a kiss from one's celebrity crush, is sometimes preferable over immediate payoffs, (Loewenstein 1987). In contrast, the same author finds that individuals seek to avoid wait times for negatively valenced experiences, such as the prospect of experiencing pain (Loewenstein 1987). Due to their schema-disrupting nature, surprises are widely considered an inherently negative emotion (Huron 2006; Plutchik 1980). We thus hypothesize that consumers are less willing to wait for surprises and thus value low uncertainty.

> Hypothesis 1.   Consumers value low uncertainty more than high uncertainty.

Hypothesis Development:

H2

The ITPRA theory by Huron (2006) defines several points in the process leading up to a surprise and starts with *imagination*, the point where subjects form all expectations about the surprising event. Closer to the point of surprise, a subject experiences *tension* as a form of preparation for the surprising moment. The following *prediction* response represents a reconsideration and refinement of former expectations regarding the imminent surprise moment. The *reaction* finally occurs in the moment of surprise, followed by an *appraisal* response yielding positive feelings in case of a harmless and pleasant surprise. Looking forward to a surprise differs from looking forward to a predefined event or offering because consumers have more images in their head when thinking of an event of which they have a clearer and more certain imagination. When customers think of a surprise, they have fewer images to ponder over in their mind, owing to their uncertainty.

> Hypothesis 2   Imagination of specific outcomes increases tension (by lowering uncertainty).

Study One

In the first experiment, we conduct a 2 (predefined vs. surprise product) x 2 (with wait vs. without wait before product disclosure) experiment on the interplay between anticipation and surprise. Participants in this experiment saw one of two advertisements for a fictional recipe subscription service that would either allow customers to pre-select their recipes (predefined condition) or send surprise recipes each week (surprise condition). We found that the surprise mechanism interacted with wait time, such that participants were willing to pay more for the predefined subscription when they had to wait, while their willingness to pay for the surprise offering was lower when it involved a wait. This supports H1.

Study Two

In the second experiment, we specifically manipulated participants' imagination during the anticipation period. We exposed participants only to the surprise version of the above fictional recipe subscription's advertisement and applied a 2 (imagery appeal vs. not) x 2 (wait time vs. not) between-subjects design. The analysis yielded a significant moderated mediation model with a marginally significant interaction between imagery appeal and wait time on tension. The mediation via tension on willingness to pay is statistically significant. This supports H1 and H2.

Study Three

We complemented these laboratory studies with a field experiment that seeks to replicate the process of anticipating a surprise as proposed by the ITPRA theory (Huron 2006). It investigates whether the sequence of imagination, tension, prediction and reaction, and appraisal also hold in real-life consumer behavior in the retail realm and asked participants before and after receiving the subscription box regarding their ITPRA-related feelings. The study confirmed the ITPRA process of anticipated surprise and was successfully re-

produced in a real-life setting, such that more imagination leads to higher tension and, subsequently, to higher liking of the surprise. This supports H2.

Conclusions

Scholars, so far, have only regarded surprise and disconfirmation in unexpected instances. By explicitly incorporating surprise as part of consumer goods subscriptions, this project extends research on anticipation and delight. Our findings have important implications for subscription providers and E-Commerce retailers in general, whose customers all face wait times between order and receipt of a purchase. Retailers now need to design processes that allow consumers to use such wait times for building anticipation and savoring. This research, thus, challenges previous notions about consumers' motivations to exert full control over their purchasing journeys and allows us to demonstrate the central effects and value of managing customers' anticipation in regard to surprise purchases.

Consumers as Brand Managers: Exclusion and Status in Brand Communities

Samantha Bittner, Ohio Northern University, USA
Tatiana Marie Fajardo, Florida State University, USA

EXTENDED ABSTRACT

In this research, we examine the motivation to exclude others from a brand affiliated group and the effect of doing so on consumers' desire for branded products. Among those with low domain-relevant experience, peripheral group status and the associated feelings of insecurity regarding group membership should make social needs particularly salient. For those with high domain-relevant experience, who are viewed as core group members, perceptions of membership security should generate a sense of acceptance and belongingness that addresses social needs. Thus, those low in domain-relevant experience should use the brand community to satisfy social needs, whereas those high in domain-relevant experience may use the brand community to satisfy ego needs.

Excluding others has been linked to a decrease in belongingness (Bastian et al. 2013) but an increase in perceptions of power and status (Dijkstra et al. 2008; Thibaut and Kelley 1959; Zadro et al. 2005). Inclusion of others, by contrast, has been shown to increase feelings of social connectedness and satisfy belongingness needs (Wellman and Wortley 1990) but decrease perceptions of power, posing a threat to fulfillment of ego needs (Cillessen and Mayeux 2004). This suggests that community members who perceive high levels of domain-relevant experience are more likely to exclude others than community members who perceive low levels of domain-relevant experience.

We test this proposition across three experiments and one secondary data study. Study 1A utilized a single factor design in which participants were randomly assigned to one of three conditions: high domain experience, moderate domain experience, or low domain experience. Participants were asked to rank how often they use nine different products, with one indicating the product they use the most often and nine indicating the product they use the least often. Participants were then assigned to imagine being a member of an online brand community depending on their randomly assigned domain experience condition. All participants were informed that in order to become a member of the brand community, applicants must be voted in by existing members. Participants were asked to vote on whether to admit a series of potential new members of the community. As expected, individuals in the high domain experience condition (M = 0.90) excluded significantly more applicants than participants in the moderate domain experience condition (M = 0.52, $F_{(1, 128)}$ = 4.43, p = 0.04) and participants in the low domain experience condition (M = 0.44, $F_{(1, 128)}$ = 6.51, p = 0.01).

For study 1B we collected discussion board postings for an online brand community for a national coffeehouse chain. In this community, members suggest ideas for improvements to the brand. Other members are then able to post responses to the idea. In total, 100 of the most recent response postings were collected from the "Popular Ideas" section of the site. Individuals who were designated as top commenters were coded as high domain experience individuals, while those not given this designation were coded as low domain experience individuals. Each of the 100 postings were coded by two independent coders, blind to our hypotheses, who determined whether each posting was considered an instance of exclusion or inclusion. As predicted, individuals with high domain experience were more likely to engage in exclusionary behavior (36 of 43 postings or 83.72% coded as exclusionary) than members with low domain experience (4 of 47 postings or 8.51% coded as exclusionary).

Study 2 seeks to examine whether the relationship between exclusionary/inclusionary behavior and brand commitment is moderated by consumers' perceptions of domain experience. This study utilized a 3 (interaction type: exclusion, inclusion, forum member) between-subjects design. Each participant's level of coffee consumption was used as a measure of domain experience. In the exclusion (inclusion) condition, participants were asked to imagine that while a member of the brand community, they receive a notification one day stating that a new member is being considered. They were then asked to imagine that after reviewing the applicant's information, they decided to vote against (for) admitting the applicant. Participants then wrote about how they thought they would feel after voting against (for) the applicant. In the forum member condition, participants were simply asked to imagine they were a member of the brand community and how they thought they would feel about being a member. Results indicated a significant interaction effect ($F_{(2, 258)}$ = 4.54, p = 0.01). Exclusion (compared to inclusion) resulted in significantly higher brand commitment among individuals with domain experience values greater than 4.40 (β = 0.40, t = 1.65). At values greater than 4.43, exclusion (compared to the forum member condition) yielded significantly higher brand commitment (β = 0.38, t = 1.65). Inclusion, relative to exclusion, resulted in significantly higher brand commitment when domain experience values were less than 2.42 (β = -0.41, t = -1.65). Inclusion, relative to the forum member condition, yielded significantly higher brand commitment when domain experience values were lower than 2.95 (β = 0.35, t = 1.65).

Study 3 determines the mediating role of an individual's desire for status and desire for belongingness. The brand community description and interaction type manipulation were similar to those used in study 2. Following exposure to the interaction type manipulation, participants completed a measure of their desire for social bonds and a measure of their status in the brand community. Participants with high (low) domain experience exhibited higher (lower) brand commitment when they excluded an applicant. Furthermore, among high domain experience participants, the relationship between the interaction type and brand commitment was mediated by feeling of status (C.I. = -0.29, -0.01) not by feelings of belongingness (C.I. = -0.41, 0.16). Conversely, among low domain experience participants, the relationship between the interaction type and brand commitment was mediated by feelings of belongingness (C.I. = 0.12, 0.65) not by feelings of status (C.I. = -0.01, 0.23).

Our results indicate that consumers high (low) in experience are more likely to exclude (include) other members, which in turn results in higher (lower) brand commitment after excluding another member. Moreover, this process is mediated via desire for status (social bonds) within the community.

Averse to Algorithms or Averse to Uncommon Decision Procedures?

Jonathan E. Bogard, Anderson School of Management, University of California, Los Angeles, USA
Suzanne B. Shu, SC Johnson College of Business, Cornell University, USA

EXTENDED ABSTRACT

In this paper, we argue that a very large share of apparent algorithm aversion is not an aversion to algorithms *per se*, but rather an aversion to uncommon decision procedures. Put simply, much of the algorithm aversion research has confounded the use of algorithmic forecasting methods with the use of an unconventional forecasting method.

When a counter-normative decision results in a negative outcome, people react more negatively (Kahneman & Miller, 1986). This tendency to penalize counter-normative decisions more harshly than nom-adhering decisions when they turn out badly could explain an apparent tendency to excessively penalize algorithms (relative to people) whenever a researcher confounds use of an algorithm with use of a counter-normative decision procedure. This leads us to predict that algorithms will be more excessively penalized when they are not the normal decision procedure.

In this paper, across four studies, we show that accounting for and/or manipulating the normativity of using an algorithm for some particular decision can minimize, eliminate, and sometimes entirely reverse algorithm aversion, demonstrating instead a preference for algorithms, whenever norms favor algorithmic decision procedures. Throughout, once properly accounting for the role of norms, we find a considerably smaller residual aversion to using algorithms. Further, we are able to decompose how much apparent algorithm aversion is due to an aversion to counter-normative decision procedures and how much is due to algorithm aversion *per se*.

The purpose of Study 1 (N=1168) was to test whether the amount of algorithm aversion is significantly lower when use of the algorithm was the norm for that decision. In a 2 (norm: consistent or inconsistent) x 2 (procedure: observed an algorithm or human err) between-subjects design, participants were told that the norm was for some particular medical analysis to be conducted by a doctor [algorithm]. Participants then observed an algorithm [doctor] fail, and were asked about anticipated regret.

We found, as predicted, a significant interaction suggesting that the amount of algorithm aversion depends on whether the norm is for the doctor or the algorithm to choose (beta = 2.27***). In fact, the interaction is so strong that we observe a complete crossover: when the doctor is the norm, we find significant algorithm aversion; when the algorithm is the norm, we find a significant preference for algorithms.

Additionally, beyond confirmation of our main hypothesis, we find evidence of four important insights.

(1) How much norms matter: Expected regret of choosing an algorithm that fails is considerably lower if the norm is for the algorithm, not the human, to make the decision (beta = -1.13***).

(2) Replicating traditional algorithm aversion: If the norm is for humans to choose, we observe greater regret when choosing the algorithm as opposed to the human (beta = -1.72***). This, we believe, is what has been mistakenly labeled "algorithm aversion" any time the selection of an algorithm has coincided with the norm of using a human forecaster for that particular domain.

(3) Reversing algorithm aversion: We find that, when algorithms are the known norm, greater regret is associated with a failed human rather than a failed algorithmic prediction (beta = 0.55***).

(4) Cleaner Test of Algorithm Aversion. We find that, conditional on a decision being norm-consistent, there is a greater penalty associated with failed decisions made by algorithms compared to humans (beta = 0.58***). Hence, while its effect is approximately half the effect-size of norms, we do in fact see a residual aversion to algorithms.

Study 2 (N=548) was a near-identical replication of Study 1 with one critical change: we tested whether the dependent measure of expected regret from Study 1 is a mediator of a measure more common of the algorithm aversion literature: participants' choice of whether to use an algorithm or human for a subsequent decision. To assess this, after mimicking the design of Study 1, we asked subjects who they would choose for a similar analysis for their own health decisions.

As hypothesized, whether participants penalized erring algorithms more than erring humans in their subsequent choice depends on whether the observed failure was norm-consistent or not (beta = 3.74***). Moreover, the effect of norm inconsistency on subsequent choice is mediated by expected regret. Norm-consistency significantly lowered expected regret (beta = 0.73***), which in turn was associated with greater likelihood of choosing an algorithmic forecaster (beta = -0.73***). A bootstrapped indirect effect of 0.17 was highly significant.

In Study 3 (N= 390), participants read a description of two people who missed a flight because of a route deviation, one suggested by a cab driver and the other suggested by Google Maps. Participants were asked how likely they would be to follow a suggested route deviation themselves if it came from Google Maps versus a cab driver. They were also asked about the normalcy of navigation by Google Maps. As predicted, the extent to which people prefer a human to an algorithm depends on how uncommon they think it is for an algorithm to suggest a route (beta = -0.46***). Moreover, contrary to the predictions of algorithm aversion, we found no smaller preference for using Google Maps among those who read about erring humans and algorithms compared to those in the control condition who did not read about these failures.

In Study 4 (N=469), we tested whether the same pattern of aversion to counter-normative decision procedures holds in the context of potential gains rather than realized losses. We replicated the design of Study 1, this time in the context of someone standing to gain $1000 in a betting pool based on predictions of football games. We find an identical pattern of results as observed in Study 1 for all tests except one: we find no residual aversion to algorithms once accounting for norm-consistency (beta=0.19, p=0.298 NS).

In sum, we're able to replicate the typical algorithm aversion findings, minimize or reverse them, explain them in terms of norm-adherence or norm-violation, and perform a cleaner test of algorithm aversion. When we isolate the independent effect of norm-consistent algorithm aversion, we find that it sometimes—though not always—persists, and is considerably smaller than the effect of norms.

Despite the fact that algorithms often outperform human forecasters, there is evidence that people seem to prefer human recommendations (Dietvorst et al., 2015). Here we show that this may be driven, to a very large extent, by an underlying aversion to decision procedures that are against the norm. As norms change and algo-

rithms become more broadly accepted for a given forecast or decision—as they have in domains as disparate as navigation and dating recommendations—we expect people's tendency to unduly punish them to shrink commensurately.

Products in Disguise: Communicating Product Benefits with Surface Mimicry

Caroline De Bondt, Ghent University, Belgium
Anneleen Van Kerckhove, Ghent University, Belgium
Maggie Geuens, Ghent University, Belgium

EXTENDED ABSTRACT

This article advances that surface mimicry—designing one product to look like another product (Lidwell, Holden and Butler 2010)—is an effective technique to communicate property information to consumers. Specifically, we posit that due to the inclusion of a visual property of another product (i.e., shape, package or serving mechanism) into the appearance of a target product, surface mimicry induces property mapping: a thinking style which leads consumers to transfer property information from one product onto another altering consumers' target product beliefs (Wisniewski 1996).

Based on extant research in psycholinguistics and marketing, we propose that surface mimicry will lead to property mapping when the following conditions are met. First, the two products share alignable properties (Wisniewski 1998). Second, the target product and mimicked product differ in terms of the alignable attribute(s) (Wisniewski 1996; 1997). For instance, consider the conceptual combination 'zebra horse'. A zebra and a horse share many communalities (e.g., four legs, identical body shape), but differ in skin tone (stripes). Skin tone is thus the alignable property which will be mapped from a zebra onto a horse. Third, mapping the value of an alignable property of the mimicked product onto the target product occurs only when this property is salient (Aaker and Keller 1990; Swaminathan et al. 2015). In addition, claims that are beyond a certain threshold of credibility will not lead target beliefs to assimilate (Stafford, Leigh, and Martin 1995). Hence, we hypothesize:

Hypothesis 1:   *Designing a target product to mimic a modifier product leads the target product's beliefs to assimilate with the (a) alignable, (b) dissimilar, and (c) salient attributes of the mimicked product (= surface mimicry effect).*

Hypothesis 2:   *The activation of a property mapping mindset underlies the surface mimicry effect.*

Hypothesis 3:   *The surface mimicry effect is attenuated when the distance in beliefs between the target product and the mimicked product is more (vs. less) substantial.*

We demonstrate the potential of surface mimicry and test our hypotheses by applying the technique to healthy food. Healthy food products often are perceived as poor tasting (Belei et al. 2012). Therefore, we copy a visual property that is prototypical for a tasty food product to the appearance of a healthy food product in order to communicate that the healthy product also is tasty.

Study 1a established that surface mimicry increases taste beliefs of a healthy product, but only when taste is an alignable property with a dissimilar value (H1a,b). We assigned 193 Mturk participants randomly to an advertisement presenting a piece of watermelon (1) in its regular shape (control), (2) as a popsicle (taste=alignable, dissimilar), (3) as an apple (taste=alignable, similar), or (4) as a star (taste=non-alignable). Taste perceptions of the watermelon only increased when it mimicked a popsicle.

Study 1b followed up by illustrating that surface mimicry for alignable, dissimilar attributes also has downstream consequences on food consumption. While watching a short movie fragment, 111 undergraduates could consume a snack ad libitum. This snack was either a healthy (baby carrots) or unhealthy product (chips) and either came on a plate (control) or in cone typically used to serve French fries. As expected, participants ate more when the baby carrots came in a French fry cone than on a plate (taste$_{carrots-fries}$=dissimilar), but mimicry did not affect chips' consumption (taste$_{chips-fries}$=similar).

Study 2 showed that shape mimicry influences those beliefs that are most salient for the mimicked product (H1c). Sixty-three members of a consumer panel participated in a mixed experiment in which they evaluated (1) either a normal kiwi or a kiwi shaped as a popsicle (taste=salient) and (2) either a normal popsicle or a popsicle shaped as a banana (health=salient). As expected, participants rated the mimicked kiwi's tastiness higher than the regular kiwi while no difference occurred for perceived healthiness, and the exact opposite pattern was found for the popsicle.

Study 3a provided empirical evidence for the claim that surface mimicry primes a property mapping process (H2). One alternative manner, besides property mapping, to interpret combinations of objects or concepts is "relational linking". Relational linking implies that people search for a plausible relationship between two concepts such as when they interpret a whale boat as a boat used for whale watching, whereas under property mapping it would be interpreted as a boat shaped like a whale (Wisniewski 1996, 1997). After 100 Mturk workers were exposed to an advertisement depicting vegetables either in its normal shape or mimicking a burger, they were presented five novel noun-noun phrases (Wisniewski and Love 1998), for which they indicated which interpretation (a relational linking vs. a property mapping) they thought was more plausible. Results show that the surface mimicry (vs the control) condition yielded a higher plausibility of property mapping interpretations. In addition, a bootstrap mediation analysis disclosed that the extent of property mapping underlied the effect of surface mimicry on taste beliefs.

Study 3b corroborated the conclusion of study 3a. Before being exposed to an ad depicting walnuts in a bucket typically used for popcorn, a total of 172 Mturk participants either received (1) no processing instructions, or were instructed (2) to "think about the relation between the two" (relational linking condition) or (3) to "think about product characteristics that the product could share with the product typically served in this package." Results denote that participants' taste beliefs in the control condition equaled those of participants in the property mapping condition, but were different from the ones in the relational linking condition, providing support for the hypothesis that consumers spontaneously engage in property mapping when processing a surface mimicry ad.

To test H3, study 4 considered two healthy target products (cherry tomatoes and Brussels sprouts) that differ in the extent to which their associated taste beliefs differ from the mimicked product's taste beliefs (a lollipop). Randomly exposing 149 Mturk workers to a picture that featured either cherry tomatoes or Brussels sprouts in their normal shape or mimicking a lollipop mimicry showed that surface mimicry ameliorated taste beliefs of both products, though the resulting change is less outspoken for Brussels sprouts than for cherry tomatoes.

Consumer Hope For Material Wealth in the New African Pentecostalism

Samuel K. Bonsu, GIMPA, Ghana
Jemima Nunoo, GIMPA, Ghana
Fadwa Chaker, Toulouse Business School, France

EXTENDED ABSTRACT

We explore African Pentecostal adherent practices/processes, drawing on a five-year ethnographic study located in Ghana. We conclude that the African Pentecostalism promise of material well-being dramatically transforms local practices in a manner that allows adherents to nurse hope for immense material wealth, even for those whose realities offer no hope.

Introduction

...the selling point of the Pentecostal message is the offer of rewards that blends the positive aspects of all these events. Such rewards imply significant enough material wealth that one can afford the luxuries of life, along with social markers such as good home, a decent job, a Mercedes Benz automobile, and high social repute... This hope [has become an important product that is]... promoted (Bonsu and Belk 2010; p. 312).

African Pentecostalism emerged out of the independent African churches Movement that was pioneered by Aladura Church, founded in Nigeria (Peel 2016). In the age of globalization, these churches now offer practices in adherents' material realities that are well-integrated into globalization's consumer ideology – with promises of economic paradise (Bonsu and Belk 2010)

– and neglect of the orthodox Euro-American Christian ideal that restricts material indulgences.

The epigraph references how African Pentecostalism proffers hope of eschatological salvation as well as good health and immense wealth on earth, through complex contemporary global branding practices (Bonsu and Godefroit-Winkel 2016).

Selling such hope in God has become the cornerstone of the new Pentecostalism that operates in a world of material conspicuous consumption that does not always include the poor. As an effective mechanism for coping with poverty (Yurdakul and Atik 2016), Pentecostalism invites the poor to a type of "imaginative hedonism" (Campbell 1987) that places them in a state of desire for immense wealth beyond reasonable reach (Benyah 2019), grounded in the contemporary notions of "development by market" (Bonsu 2019) intermingled with religious ideologies. Taking on a global cosmopolitan veneer, the new African Pentecostalism embraces a diversity of religious traditions that come together to emphasize supernatural gains manifested in material abundance for believers (Bonsu and Belk 2010).

As capitalism has traversed a globalized world, it has been informed by local cultures, leading to many "capitalisms" (Freeman 2012). However, research has only begun to recognize the breakdown of opposition between the spiritual and the material (Taylor 2007) that funds the African Pentecostal pragmatism that defines adherents' consumption and material priorities (e.g., Appau and Ozanne 2020; Asamoah-Gyadu 2010; Gifford 2003). Consequently, this paper sought to excavate the underpinnings of African Pentecostalism for purposes of crafting theory and relevant modes of understanding that fits the new African religious orientation. The paper explores the ideological tenets of Pentecostalism and its value through ethnographic studies in Ghana, West Africa. Ghana is a politically stable country that exhibits a vast array of Pentecostal beliefs/practices.

This diversity offers an excellent opportunity for theorizing towards a comprehensive framework for understanding Pentecostal logics.

We also seek to understand the foundations of adherents' hope for material and eschatological salvation, and what happens in the events that their hopes do not materialize. That is, many of the hopes offered by Pentecostal preachers do not come to pass. However, adherents do not lose hope but may even grow stronger in their expectations of success. In

an effort to understand this situation, we draw on Goffman's (1952) notion of "cooling down the mark" that attempts to explain why people might be conned repeatedly. We speculate that contemporary reframing and transformation of religion contributes to adherents' continued escalation of commitment towards effective pursuit of balance in the face of existential demands that are not always convergent. Ultimately, we propose a theoretical frame of reference for explaining consumer blending of religious and secular ideologies within their material realities, and how they manage failures.

Method

We conducted a five-year ethnography to explore African Pentecostal experience as a lens for understanding the processes and practices of religious reformulation in contemporary culture. Participant observation, depth interviews. TV broadcasts and textual materials were the primary sources of data. We attended church services in addition to church-sponsored conventions and open air "crusades" (services) that were organized by various Pentecostal churches. Except for keeping field notes, observed events were not recorded. However, many sermons are available on CDs sold by the churches.

In addition to participant observations, we conducted depth interviews with 26 Pentecostal informants (12 male, 14 female). Interviews helped explore the meanings of evangelical Pentecostalism to informants and the practices that were associated with their beliefs. Interviews took place at the informants' places of work or at their church and lasted an average of one hour; some extended over several days. They were all conducted in English. Some informants suggested key reading material that they viewed as fundamental to their beliefs. We read these materials and analyzed numerous messages preached by church leaders.

Data analysis was an ongoing process that began during initial data collection and continued throughout the research process (Emerson, Fretz, and Shaw 1995). Earlier analysis was considered preliminary, intended mainly to guide data collection with a focus on grounded charismatic Pentecostal practices and their relationship to the analytical categories that were emerging from the data. Detailed analysis began after data collection with a complete reading of field notes, interview transcripts and other data. Such reading allowed for thematization at the global level within the data. Our approach was one that required travel back and forth between personalized accounts and analytical structures in the process of developing theoretical points of interests (Emerson, et al 1995). Our diverse data sources allowed for cross-integration of interpretations.

Findings: Dream-Making

"Dream-making" represents the Pentecostal practice of setting improbable material goals and desires within the modalities of religious understanding. The Pentecostal adherents we observed per-

ceive Divinity's primary role is to provide the requisite platform and resources (e.g., intellect, health, opportunity) for a potentially successful material life. The adherent ideally converts these resources into immense material wealth through specific practices including prayer, active learning, and forming social networks within the broader church family. Within this religious framework, the bounds of material and religious achievement are rendered limitless. The pattern of crafting dreams and demanding them through faith and action is sustained by at least two processes: sense-breaking and sense-giving, as per Pratt (2000).

Sense-giving. Pratt (2000; p. 469) defined sense-giving as a socialization process of

learning to focus one's mind on positive enforcements that are "uplifting and edifying". Sense- giving is akin to Peale's (1952) "positive thinking," differing on the core point that the individual not only thinks positively but actively ignores external sources with the potential to counter or defeat such thinking. The individual also takes self-initiative toward goal achievement by faith, prayer, and action. Miracles are harnessed in the service of grand consumption goal fulfillment.

Drawing on the life of David in the Bible, in the broader context of the interview, one informant (Garth) identified suffering – by which he meant delayed gratification of consumption needs – as training for how he would live with his God-given wealth as a Christian. Garth's hope for his own material wealth is sustained by his belief that his current financial situation is not ideal but it is consistent with his station in life and that in God's time he will meet all his material needs. These needs include moving out of his parents' home into one of his own, buying a car, and studying abroad. Although reason may calculate what is desired, it is non-reasoned faith and action that provide for the congregant's seemingly impossible desires.

Adherents are also taught to seek material fulfillment across a diversity of life situations including marriage and protection of self (and others) from evil. Prayers are consistent with the observation that Africans do not distinguish between sacred and secular requests in prayer (Carter 1976), and that their requests are often pragmatic solutions to the vagaries of everyday life (Mbiti 1975). It is not surprising, then, that informants had one major symbol of material success in Ghana – a Mercedes Benz – on their prayer lists. The high status symbolism of this automobile indicates the extent to which Pentecostal practice connects to adherents sense of self identification and status negotiations through objects. For the poor, the open and aggressive pursuit of wealth may well be the appeal of the new Pentecostalism. It offers hope for a better future economically and spiritually. So, sermons, prayers and other church activities are key socialization equipment that allows adherents to live in a world of hope in anticipation of the good life. They are supported by tremendous camaraderie among adherents.

Sense-breaking. Analyzing the experiences of informants whose dreams were achieved and those whose were not suggested a pattern that governed dream-making. We have labeled this pattern as "sense-breaking". Whereas sense-giving focuses on the adherent learning to equip him or herself with the necessary skills for Pentecostal living, sense-breaking is a process of religious seeking that devalues the individual's sense of self to create a meaning gap that must be filled (Pratt 200; p. 464). It represents a breakdown of meaning and connects the need for new meaning to an ideal self-grounded in material possessions. The ideal self is one that extends to include material possessions (Belk 1988) and so "the self is not just a physical entity bounded by skin [but] a psychological construct in which the concept of *me* and the concept of *my* are blended" (Pratt 2000; p. 464). Sense-breaking involves identification of role models who exemplify the ideals being pursued. These role models become the satisfaction point for self-completion.

Grounded in the prosperity doctrine, Pentecostal adherents demonstrated various facets of sense-breaking. They set improbable material desires that were aligned with several Biblical figures recast as materially successful role models (e.g., David, Solomon, Jesus). We observed that achieving material expectations that would seem improbable (e.g., jobs beyond their qualifications, luxury cars beyond their economic means) indicated the adherent's Pentecostal piety. In the spirit of grandiose living as religious work, Joan observed that:

> [God] wants us [all Pentecostals] to do well. The riches on this earth are His. King David was a very rich man, King Solomon was a very rich man, the Jews are very rich people, these are God's people…Solomon did not hide his riches
> ….God knows we need riches to survive and do well…the more we have, the more we can do God's work…(Joan)

Notice Joan's alignment of her material ambitions with the financial success of biblical Kings, and her unambiguous portrayal of riches as a "need", without which she cannot do God's work. Within this newer ethics and morality, self-denial is not highly valued as it signals disobedience to God and church (Heward-Mills 2002). Breaking sense here involved a careful reformulation of traditional protestant ideal of asceticism (Weber 1958) to allow for immense wealth as a necessary part of Pentecostal existence. This is in spite of the fact that Solomonic riches were unlikely for Joan. The wealth of David and Solomon serves as a destination point for the adherent and she acknowledged the possibility of not achieving this goal. However, she noted her obligation to defy conventional wisdom in her implied "get rich or die trying" motivation. Thus, facilitated by sense-breaking, the Weberian notion of self- denial highlighted by Mason (1998) has given way to a more aggressive pursuit of wealth for purposes of social distinctions among these Pentecostals. Reason is cast away in favor of religious "magic" (miracles) as the source of meaning for outcomes.

Sense-breaking and its implications are challenged when the unconventional expectations are not realized. Some informants held that the unlimited flow of answers to prayer may be tempered by "God's will", in which case the believer does not receive the expected answer. For example, Reba prayed for admission into law school and did not receive it. She attributed the outcome to God's plan for her life – setting her up at her current workplace for reasons that are still not apparent to her. She has faith and hope that there is a positive aspect to this outcome and that in time, she will find the direction that God has chosen for her. The seeming contradiction in this observation is one that Shaw (2001) identified as necessitating various dissonance reduction strategies. Shaw observed selective attention to successes and reinterpretation of instances of failure to achieve prosperity or specific consumer desires for which God had been petitioned. In this way, hope for prosperity is sustained despite evidence to the contrary.

To counter the dissonance (Festinger 1959) and disidentification (Elsbach and Bhattacharya 1997) that would otherwise result from failed belief and prayer, Reba reconstructed her belief in expectation of future goals, suggesting no need to explain her failure in the present. The challenge to Reba's belief that God answers all prayers is mitigated by the employment of new cues – a current job that places her in an economic position that is better than many others in the country – to reconcile her expectations and the actual outcome of her prayers. She preserves the magical thinking in sense-breaking

by focusing on the fact that she is serving a particular purpose in her current job, even if she does not know this purpose yet. She still hopes to get into law school someday, noting her lack of control over what happens in her life and rendering absolute agency to God. Explanation is futile except as ordained by God.

Concluding Remarks

Although there has been research in globalization and consumer culture that draws on religion (e.g., Crockett 2017; Izberk-Bilgin,2012; Muniz and Schau 2005), these studies tend to merely employ religious motifs to understand secular consumer behavior. We combined the heritage of sociological theories with the more recent evolutionary theories (e.g., Whitehouse 2000) to suggest that African Pentecostalism has adopted a globalism stance that promises hope of material wellbeing for the rich and poor. Pentecostal adherents often exhibit consumption based affluence grounded in religious beliefs and personal actions toward economic success. The new Pentecostalism grants adherents greater personal agency for individual and societal wellbeing, thereby mobilizing adherent resources around moral and related investments toward a neo-liberal capitalist agenda that rests in a hope for material 'heaven on earth'(Freeman 2012).

We observed that the Pentecostal adherent is attracted to her church much as a shopper is attracted to a department store based on projecting herself into its window display. She perceives church facilities and church members' material expressions as evidence of God's presence in their religious lives. It is her tendency to spiritualize the everyday that feeds the transformation of ordinary consumption into religious practice. Through its processes and practices, Pentecostalism offers promises of protection from the injurious structures of contemporary globalization, especially to those on the fringes of an increasingly globalized consumer world.

Hope is a positive emotion (Shaver et al. 1987) that arises from environments or outcomes characterized as goal congruent (e.g., Ellsworth and Smith 1988; Lazarus 1991). This congruence leads consumers to encode information that suggests possible outcomes – not impossible ones (McInnis and Mello 2005). Failed hope for material prosperity is recycled in a new round of hope for success, grounded in faith. We conclude that African Pentecostalism and its promise of material wellbeing produce strategies and sentiments that dramatically transform local practices into a religiosity-infused environment where the church thrives on its ability to sell hope of material success even to the poorest in society who really have no hope of ever becoming materially wealthy.

Giving Novel Brands the Benefit of the Doubt: How Asymmetrical Instrumentality Perceptions Influence Choice

Danielle J. Brick, University of New Hampshire, USA
Jessica Gamlin, University of Oregon, USA

EXTENDED ABSTRACT

Today, it is easier than ever for firms to expose consumers to a novel brand—i.e., one that is new and unfamiliar—via online retail. One challenge for managers in this landscape is that novel brands might not yet benefit from the persuasive content promoted via traditional advertising. A brand manager must therefore understand factors that influence choice of a novel brand. In the present research, we suggest that consumer goals within the choice environment play an important role. Previous research shows that consumers choose products that align with their goals and avoid products that are misaligned with their goals (Markman and Brendl 2000; Van Osselaer and Janiszewski 2011) and that such choice is based on whether the product is perceived to facilitate one's goal or risks obstructing that goal (Peak 1955; Rosenberg 1956). Consumers thus tend to choose products that offer greater instrumentality and, correspondingly, avoid those that present greater impedimentality (Bélanger et al. 2016; Fishbach, Zhang, and Trope 2010; Kopetz et al. 2012). However, there are situations when consumers are choosing a product that is misaligned with a goal they have (Hofmann et al. 2012). For example, a consumer may generally have a goal to be healthy but is confronted with a choice of dessert options (Goldsmith, Friedman, and Dhar 2019). In these situations, we suggest they may be more likely to choose the novel brand option as the novel brand suggests lower risk, or less impedimentality, to their goal. We test our theory across five studies, including two with actual choice.

Study 1 examined consumer choice of a novel brand (vs. control) when the product was aligned or misaligned with their goal. Students (N = 132) were asked to list two reasons why it is important to "indulge and eat tasty foods" (aligned condition) or "be healthy and eat healthy foods" (misaligned condition). Participants were told they could take a candy as a thank you for completing the session. Two bowls of candy were labeled: "Zing™ candy" (novel brand) or "candy" (control). A logistic regression of goal condition on choice showed a marginally significant effect ($p = .07$): In the goal-aligned (indulgence) condition participants were equally likely to choose the novel brand (52%) and control (48%; $p > .25$); whereas, in the goal-misaligned (health) condition, participants were significantly more likely to choose the novel brand (68%) compared to control (32%; $p < .01$).

In study 2, we examine why this effect arises, theorizing an asymmetrical instrumentality effect, such that when the product is aligned with a consumer's goal they perceive the novel brand to be equally instrumental to their goal, but when the product is misaligned with their goal, they perceive the novel brand as less harmful. MTurkers (N = 453) were told, "We are interested in how various products help or hurt people's goals." They completed a six-item instrumentality scale, our DV, which manipulated both brand (novel vs. control) and product-goal alignment (aligned vs. misaligned) in a between-subjects design. Participants in the novel brand [control] condition and *aligned* [*misaligned*] condition responded to items such as, "Does Zing Cola [soda] help or hurt your goal to have something *tasty* [*healthy*]?" (averaged into an index of instrumentality; α = .98). An ANOVA revealed the predicted interaction ($p = .01$): In the goal-aligned (indulgence) condition participants perceived the novel brand and control to be equally instrumental ($p > .25$); whereas, in the goal-misaligned (health) condition, participants perceived the

novel brand (vs. control) to be significantly *less* harmful ($p < .01$). Study 3 replicated these findings using a different product category (cough syrup) where the aligned (health) and misaligned (taste) goals were reversed.

Study 4 was a spontaneous thought listing task. MTurkers (N = 195) listed the "first five things that come to mind when you think about" either "Zing candy" (novel brand) or "hard candy" (control). An RA, blind to our hypothesis, coded participants' responses for the number of thoughts that were both instrumental to taste goals (aligned; e.g., sweet, tasty) and impedimental to health goals (misaligned; e.g., dentist, cavities). T-test analyses showed an equal number of instrumental features for the novel brand and control ($p > .25$), but significantly fewer impedimental features for the novel brand compared to control ($p < .05$), further reflecting the asymmetric instrumentality effect.

In our final field study, we show product-goal (mis)alignment on novel brand choice is mediated by instrumentality perceptions. We placed a "Taste Test" sign (activating a misaligned goal) on a table with two bowls labeled "Zing™ cough drops" (novel brand) and "cough drops" (control). Participants in the ostensible taste test (N = 79) rated the instrumentality of both the novel brand and control (anchored 1 = "tastes very good" and 9 = "tastes very bad"). Participants then made their choice. In this goal-misaligned situation, results revealed that the novel brand was chosen more frequently (61%) than the generic product (39%; $p = .05$). A repeated measures ANOVA showed that participants perceived the novel brand of cough drops to be less harmful (i.e., tastes less bad) than the generic cough drops ($p < .05$). Showing support for our full model, a logistic regression revealed that instrumentality perceptions significantly predicted choice, such that those who thought the novel brand was less harmful were more likely to choose a novel brand cough drop over a generic one ($p < .05$).

Across five studies we find that asymmetric instrumentality perceptions influence novel brand choice. When products are aligned with consumer goals, consumers are equally likely to choose a novel brand (vs. control) as they perceive both to be equally instrumental. However, when products are misaligned with consumer goals, consumers are more likely to choose the novel brand as they perceive the novel brand to be less impedimental, i.e., less harmful to their goal. This research has implications for branding, brand choice, consumer perceptions of product instrumentality, and consumer goal pursuit. Moreover, the present research can help managers determine when a novel brand is most appealing to consumers.

When and Why Choices for Others Diverge from Consumers' Own Salient Goals

Olya Bryksina, University of Winnipeg, Canada

EXTENDED ABSTRACT

Imagine that you are on your way to a spa and your goal is to have a pleasant relaxing experience. You stop at a mall to pick up a present for your friend as his/her birthday is coming up. Is it possible that your own salient goal of having a relaxing experience will make you less likely to choose something relaxing as a gift for your friend? Here we inform this question by investigating how choices for others are influenced by consumers' own salient goals.

Prior findings have identified predominantly factors relevant to the recipient and/or the process of giving (Baskin et al. 2014; Robben and Verhallen, 1994; Ward and Broniarczyk, 2016; Zhang and Epley, 2012). Here we investigate how consumers' salient personal goals, unrelated to the process of giving, influence choices made for others. We show that consumers prefer options that are inconsistent with their own salient goals when choosing for others because such choices allow consumers to enhance the perception of their own progress on a goal. This occurs for goals held at an individual (vs. group) level and when choice-for-others situation exhibits relationship (vs. recipient) focus.

A prominent characteristic of goals is that they generate motivation to make goal-progress through engaging in goal-consistent actions (Carver and Scheier 1990; Dijksterhuis et al. 2007; Sela and Shiv 2009). Consumption of goal-consistent products allows individuals to perceive making progress on a salient goal (e.g., Atkinson 1957; Ekin and Laran 2019; van Osselaer and Janiszewski, 2012) hence salient goals motivate consumers to choose goal-consistent products for themselves. Goal-progress, however, is not only influenced by one's own goal-consistent (vs. inconsistent) actions but also by the standard of comparison used to assess progress. The higher the standard of comparison, the lower the perception of one's own progress. For example, responding on a higher (vs. lower) frequency response-scale primed participants to perceive making lower (vs. higher) progress on their fitness goal (Etkin and Ratner 2012). Likewise, reading that the average American exercises more (vs. fewer) times per week primed participants with perception of lower (vs. higher) fitness-goal progress (Park and Hedgcock 2016).

Here we argue that goal-consistent products chosen for other people will raise the standard of comparison for the assessment of consumers' own goal progress. Hence, goal-consistent (vs. goal-inconsistent) products chosen for others will be perceived as undermining (vs. enhancing) consumers' own progress on a salient goal. Thus, salient goals will motivate consumers to select goal-inconsistent products for others to enhance their own perception of progress on a salient goal.

We also suggest that this effect will only occur for choice-for-other situations that exhibit a relationship (but not recipient) focus (Liu et al. 2019). This is because in relationship-focus situations consumers self-reflect on how the choice bears on them, whereas in recipient-focus situations consumers focus on the self is greatly diminished (Liu et al. 2019). This lowers the likelihood that choice for another will be based on the consideration about how it influences consumers' own perceived goal progress. Hence, in recipient-focus situations the focal effect should not occur.

Further, we suggest that the focal effect be attenuated for goals held at group level. A goal is set at a group level when a specific level of performance that is to be attained is measured by collectively assessing the level of performance of all group members (Weingart and Weldon 1991; Weldon and Weingart 1988). Consumers should prefer goal-congruent products for others for salient goals set at group level because choosing a goal-consistent (vs. goal-inconsistent) product for another person should contribute to the perception of progress on the salient goal.

Five experiments tested the proposed effects. Experiment 1 established that goal-inconsistent (vs. goal-consistent) products chosen for other people enhance (vs. undermine) the perception of consumers' own progress on a salient goal. Female participants primed with a beauty goal perceived that they made more (vs. less) goal progress after they imagined buying a wine-tasting package (vs. beauty-spa package) for a friend. Experiment 2 showed that participants make salient-goal-inconsistent choices for other people when faced with actual choices. Undergraduate students were primed either with a goal of healthy eating or with a goal of indulgent eating. Participants primed with a healthy (vs. indulgent) eating goal were more likely to select a chocolate bar (vs. apple) to give to a friend. Experiment 3 showed that imputing goal-progress-generating value onto an otherwise neutral option reduces the choice of this option for a social other. Experiments 4 demonstrated that attenuating the effect of goal-directed choice on the perception of goal progress (via restricting participants' psychological choice freedom) increased the choice of a goal-consistent option for a social other. Finally, Experiment 5 showed that the focal effect is attenuated for goals held at a group level and for choice-for-other situations that exhibit a recipient focus. Participants primed with a going-green goal were more likely to select a hummer ride than a nature walk for a social other than for themselves when they wrote about the importance of going green to themselves but not when they wrote about the importance of going green to society as a whole. In addition, this salient-goal-divergent choice effect only manifested when choice for other situation was characterized by a relationship focus (i.e., gift-giving and joint consumption) but not when it was characterized by recipient focus (caregiving and favor/pick-up).

These findings make theoretical contribution to choice-for-others literature by identifying a novel factor that influences choice for others and a novel psychological mechanism that underlies it. These findings also contribute to goals-based-choice model by identifying recipient as a moderator in the effect of salient goals on choice of goal-directed products. Marketers can enhance the appeal of their products as gifts by positioning them incongruently with consumers' salient goals (which can be activated either directly via priming or indirectly via viewing content). These findings can also be of benefit to consumers by allowing them to be aware of the motivational effects of their own goals on choices that they make for others.

Can Side-By-Side Comparisons Compromise Decision Outcomes?
A Construal-Level View of Evaluation-Mode Effects

Olya Bryksina, University of Winnipeg, Canada
Na Xiao, Laurentian University, Canada

EXTENDED ABSTRACT

Would you prefer to evaluate your choice alternatives separately (i.e., one at a time) or jointly (i.e., side by side) in order to make the best choice? We asked 505 members of the general population which mode of evaluation they thought would allow them to make a better decision. Two thirds answered that they would be more likely to make a choice based on most important primary attributes if they evaluated options side by side and would prefer to evaluate their options in that way.

Here we show that evaluating options side by side (vs. one at a time) reduces the likelihood of choosing based on the primary and most important product attributes. Drawing on literatures on evaluation mode (Hsee 1996; Hsee et al. 1999; Leclerc, Hsee, and Nunes 2005), construal-level theory (Liberman and Trope 1998; Trope and Liberman 2000), and goals-based choice (Kopetz et al. 2012; van Osselaer et al. 2005; van Osselaer and Janiszewski 2012), we demonstrate that side-by-side comparisons lower consumers' level of construal during product evaluation and choice, leading them to place relatively greater importance on secondary attributes when making decisions. This happens because side-by-side comparisons activate choice-related goals—goals pertaining to the choice process itself, such as to simplify choice or to enjoy the decision-making process (van Osselaer et al. 2005)—and, as we argue, these goals are construed at a lower level than consumption goals that are satisfied by primary attributes of products.

Evaluation mode refers to whether products are presented one at a time (SE) or jointly (JE). Product attributes that are difficult to evaluate in SE mode (e.g., how many programs a job applicant has coded) gain importance in product evaluation in JE mode (Hsee 1996; Hsee et al., 1999), and consumers tend to focus on information about products that is unique more so in JE than in SE mode (Kruger et al., 2014; Schley et al., 2017). Also, JE mode activates choice-related goals (i.e., goals relevant to the choice process itself, such as to simplify choice or to enjoy the process) in consumers which leads to increased importance of attributes that help to satisfy these choice-related goals (Xiao, 2019).

Construal level refers to whether information is processed at a relatively high abstract level, focusing on de-contextualized conceptualizations and primary product features or at a relatively low concrete level, focusing on context-specific details and secondary product features (Liberman & Trope, 1998; Trope & Liberman, 2000). When people pursue high-level superordinate (vs. low level subordinate) goals (Carver & Scheier, 1998) they process information at high abstract (vs. low concrete) level (Trope & Liberman, 2010).

We predict that JE (vs. SE) prompts a lower level of information construal. We predict this based on our proposition that choice-related goals activated by JE (Xiao, 2019) are construed at a more subordinate level than consumption goals (e.g., buy a high-quality TV).

In study 1, participants viewed products from six product categories either in SE mode (one product per page) or JE mode (two products from a category per page) and responded to two measures of construal—BIF and categorization. Participants who viewed products in JE (vs. SE mode) identified fewer actions in low-level terms and grouped objects into more categories—both indicative of lower-level construal. In study 2, participants evaluated two options of product (radio) either in SE or JE mode. One option was dominant on

primary attributes, while the other option was dominant on secondary attributes. JE-mode participants rated option dominant on secondary attributes more favorably that SE-mode participants. There was no difference in how option dominant on primary attributes was rated. In study 3, participants evaluated 2 options of a hotel (one dominant on primary attributes and one dominant on secondary attributes) either in SE or in JE mode. In addition, for half the participants we introduced a time-delay between exposure to options and options evaluation. According to Sela and Shiv (2009) goal activation intensifies after time delay. We expected that the effect of evaluation mode on construal level would be stronger in the time-delay condition than in the control condition. We measured attribute importance as a measure of construal. JE-mode participants assigned relatively greater importance to secondary (vs. primary) attributes than SE-mode participants and this effect was most pronounced in the time-delay condition. These results suggest that it is goal activation that led to the increase in relative importance of secondary (vs. primary) attributes in JE (vs. SE) mode condition. In study 4, participants evaluated two hotel options (same as study 3) either in SE or in JE mode. Half the participants were primed with a choice-related goal of simplifying the decision process. JE-mode participants evaluated option dominant on secondary attributes more favorably than SE-mode participants but only among participants that were not primed with a goal of simplifying the decision process. Among participants who were primed with a simplifying goal there was now difference between JE and SE conditions and option-preferences were similar to those of JE participants with no simplifying goal. These results support the notion that priming a choice-related goal lowered the level of information construal. In study 5, participants chose a snack (healthy vs. indulgent) in SE or JE mode. We also directly measured the extent to which participants held a choice-related goal of enjoying the evaluation and choice process. Low-level construal undermines self-control (Fujita et al. 2006); consistent with this notion, JE-mode participants were more likely to select an indulgent snack than SE-mode participants and the activation of enjoyment goal mediated this effect.

Our findings contribute to evaluation-mode literature, construal level theory and goals-based choice theory. Our findings can be utilized by marketers to influence consumers' construal level. Options dominant on primary (vs. secondary) attributes should be presented individually (vs. simultaneously). These findings can also be used by consumers to make better consumption decisions. Evaluate options one at a time to facilitate the likelihood of selecting based on most important primary product attributes.

Misguided Preference for Mysterious Consumption

Eva C. Buechel, University of Southern California, USA
Ruoou Li, University of South Carolina, USA

EXTENDED ABSTRACT

Consumers are increasingly choosing to engage in mysterious consumption, a phenomenon whereby consumers purchase products of unknown nature. The present research argues that the popularity of such items at least in part lies in the inherent uncertainty associated with the products, thus allowing for mysterious consumption.

Although uncertainty is widely considered as averse and uncomfortable (Gneezy et al. 2006; Kahneman and Tversky 1979), we posit that mysterious consumption represents a rare instance in which consumers seek out uncertainty because they want to be surprised (Charlesworth 1969; Mellers et al.1997; Hill et al. 2016) and want to resolve the curiosity they elicit (Loewenstein 1994; Ruan et al. 2018; Shen et al. 2015). These two forces, we argue, lead people to value the uncertainty of mysterious consumption and motivate them to seek it out.

In line with this proposition, we find a preference for mysterious consumption items over non-mysterious consumption items of equal expected value. In a pilot field study (N=100), 89% of consumers preferred a mystery stress relief ball over a comparable non-mystery one (vs. 50% choice share, $\chi2$ (99) = 60.84, $p < .001$). In study 1a (N=239), participants reported higher WTP for a mysterious selection of five (out of 20 possible) snacks ($M = \$10.13$) than for an average non-mystery selection ($M = \$7.73$; $F(1, 227) = 7.11$, $p = .008$) and for a self-chosen selection ($M = \$8.55$; $F(1, 227) = 3.15$ $p = .07$). In study 1b (N=150), participants showed a preference for the same mysterious selection over an average non-mystery selection (76% vs. 50% choice share; $\chi2$ (1, N=50) = 13.52, $p < .001$) and an above average non-mystery selection (74% vs. 50% choice share; $\chi2$ (1, N=50) = 11.52, $p = .001$). In this joint evaluation mode, however, participants preferred the self-chosen selection over the mysterious one (28% vs. 50% choice share; $\chi2$ (1, N=50) = 9.68, $p = .002$). Mediation analyses revealed that the effects were driven by wanting to be surprised (B = -1.16, SE = .31; Wald = 13.61, $p < .001$) but not by decision ease, selection effort, or wanting to explore new snacks ($ps >.11$).

Importantly, we also argue that this preference for mysterious consumption might be misguided. Surprise is traditionally conceptualized as an unexpected event (Heilman et al. 2002; Mellers et al. 1997). Mysterious consumption, however, represents a pre-announced and anticipated surprise. The anticipated nature of the surprise, along with the curiosity it elicits, we argue, leads people to engage in wishful thinking with regards to its nature (Lee and Qiu 2009; Weinstein 1980). This, in turn, leads to disappointment upon reveal of the mysterious product via hedonic contrast effect (Novemsky and Ratner 2003; Zellner et al. 2006). As a result, consumers are less satisfied with mysterious consumption items than comparable non-mysterious items.

A second set of studies provides support for the proposition that mysterious consumption can backfire. In study 2 (N=228), participants all received real boxes containing six snacks (Skittles, Haribo Gummy Bears, Butterfingers, Snickers, Welch's Fruit Snacks and M&M's) to keep as a gift. In two conditions, participants were told that they would be receiving a snack box once the experimenter finished preparing it, but the contents of the box were either mysterious (unknown to the participants) or non-mysterious (known to the participants). In a third, unanticipated surprise condition, participants received the identical box without forewarning. Mystery boxes

yielded less happiness ($M = 5.29$), more disappointed ($M = 2.59$), and less favorable ratings ($M = 3.80$) than non-mystery boxes (happiness: $M = 5.74$, $F(1, 188) = 4.32$, $p = .04$; disappointment: $M = 2.05$, $F(1, 188) = 6.66$, $p = .01$; ratings: $M = 4.11$, $F(1, 188) = 4.55$, $p = .03$) and unanticipated surprise boxes (happiness: $M = 6.06$, $F(1, 188) = 7.98$, $p = .005$; disappointment: $M = 1.64$; $F(1, 188) = 13.07$, $p = .005$; ratings: $M = 4.30$; $F(1, 188) = 7.79$, $p = .006$). This suggests that *anticipating* the surprise undermines the satisfaction with mysterious consumption.

Study 3 (N=646) provides direct process evidence for wishful thinking. After telling participants about a mystery box or a non-mystery box, we manipulated the extent of wishful thinking by either allowing no time, allowing time, or explicitly encouraging wishful thinking. Mystery boxes were rated higher when wishful thinking was impossible ($M = 3.24$) than when it was possible ($M = 2.96$; $F(1, 642) = 4.77$, $p = .029$) or explicit ($M = 2.96$; $F(1, 642) = 4.49$, $p = .035$). Replicating study 2, mystery boxes ($M = 2.96$) were rated less favorably than non-mystery boxes ($M = 3.39$) when participants had the opportunity to engage in wishful thinking ($F(1, 642) = 7.39$, $p = .007$).

Study 4 (N=244) rules out two alternative explanations. If mysterious consumption items are sought out because they provide utility from anticipation and/or reveal, then longer anticipation should yield greater utility. Participants either forecasted or reported utility from anticipation/ reveal after a short or long anticipation period. In contrast to these explanations, forecasters anticipated deriving marginally less utility from anticipation ($M = 3.63$) and equal utility from reveal ($M = 4.30$) after a long versus short waiting period (anticipation: $M = 4.06$, $F(1, 240) = 3.11$, $p = .079$; reveal: $M = 4.50$, $F < 1$). Experiencers reported deriving significantly less utility from anticipation ($M = 2.83$) and directionally less from the reveal ($M = 3.49$) after a long versus short waiting period (anticipation: $M = 3.60$, $F(1, 240) = 10.21$, $p = .002$; reveal: $M = 3.91$, $F = 2.63$, $p = .11$).

Together, we show that consumers prefer uncertainty in the context of mysterious consumption, but that this preference is misguided. Past research shows that uncertain rewards can approximate (Goldsmith and Amir 2010; Laran and Tsiros 2013) or outperform (Shen et al. 2015) certain rewards during goal pursuit. Extending these initial findings, we directly focus on the evaluations of certain and uncertain target outcomes and demonstrate a *preference* for uncertainty. Furthermore, we demonstrate that surprises can backfire when they are anticipated.

I Just Can't Quit You: When Good Habits Undermine Self-Control

Bryan Buechner, Xavier University, USA

Ashley Otto, Baylor University, USA

EXTENDED ABSTRACT

Political ideology reflects a set of ideals and principles that explain the basis by which society should function (Jost, Federico, & Napier, 2009). The construct is traditionally divided into two ideological groups: those who believe in maintaining the present social system (i.e., conservatives) and those who believe in individual liberty and social equality (i.e., liberals) (Gutmann, 2001).

Research on political ideology has recently extended the breadth of differences between these these groups to the domain self-control. Specifically, greater endorsement of political conservatism (vs. liberalism) is associated with elevated self-control in the form of greater attention regulation and persistence on tasks requiring response inhibition (Clarkson et al., 2015). Response inhibition is defined as the ability to override thoughts and behaviors that interfere with an existing decision rule (Baddley, 1996). The rationale for this success stems from conservatives' perceived control over their actions which, in turn, heightens their ability to regulate their attention (Rigoni et al., 2012). Indeed, this heightened attention and ability to inhibit unwanted responses is crucial in creating and building effective habits (Wood & Neal, 2009).

In the current work, we hypothesize that the inhibitory function that facilitates conservatives' self-control success comes at the expense of greater mental rigidity. This rigidity generates from repeated reliance on a decision rule (i.e., mental sets; Luchins & Luchins, 1959). Although reliance on decision rules can generate repeated solutions quickly and efficiently, the "mechanized mindset" it produces makes it difficult to update to new rules (Smith, 1995). As such, while inhibition can facilitate *habit formation* through persistence, it can consequently impair *habit change* through inability to update based on external influences (e.g., rule changes, newer relevant information).

We therefore posit that inhibition (i.e., adherence to a decision rule) can conflict with the ability to actively modify information in working memory to update the appropriate decision rule. Moreover, this conflict should make updating to a new decision rule more frustrating for conservatives, as these individuals not only perceive greater control over their actions (Carey & Paulhus, 2013; Clarkson et al., 2015) but exhibit an inherent resistance to change (Jost et al., 2003). In all studies, ideology was self-reported, using various measures (Knight, 1999; Jost, 2006).

In an initial study ($N = 204$), undergraduates completed fifty trials of a classic number string task. Participants were presented with a rule to confirm to in the first twenty-five trials (response inhibition task) and then that rule changed in the final twenty-five trials (updating task). We assessed response latency as our index of performance and included demographics (gender, age, ethnicity, education, income) as covariates. The findings revealed a significant ideology × trial interaction ($p = .008$); conservatives outperformed liberals on the fixed trials ($p = .01$), whereas liberals outperformed conservatives on the updating trials ($p = .02$). Thus, conservatives' fixation on the original decision rule, though initially beneficial, impeded their performance when the decision rule changed.

A follow-up study ($N = 194$) included a condition where the rule did not change to isolate the impact of the rule change on performance. The findings again revealed that conservatives outperformed liberals on the first twenty-five trials ($p = .002$). Yet on the second twenty-five trials, liberals outperformed conservatives when the rule changed ($p = .03$), whereas conservatives continued to outperform liberals when the rule remained fixed ($p = .01$). Importantly, along with standard demographics, we assessed intelligence, religiosity, and perceptions of task complexity as covariates. As a result, this effect appears isolated to the impact of political ideology on fixation with a decision rule.

In a third study ($N = 196$), we assessed the extent to which conservatives' performance stemmed from their struggle with the rule change. Participants completed a set of anagrams where they were randomly assigned to a condition where the decision rule (i.e., the number of letters required to solve the anagram) was either held fixed or varied. Participants saw three total anagrams and were allowed 30 seconds to generate responses for each anagram before indicating (in random order) their levels of motivation and frustration. The findings revealed a significant decision rule x ideology interaction ($p = .001$); conservatives generated more correct solutions than liberals in the fixed rule condition ($p = .01$), whereas liberals generated more correct solutions than conservatives in the variable rule condition ($p = .055$). Additionally, the frustration data revealed a significant pathway of moderated-mediation; conservatives' elevated levels of frustration impaired their performance when the decision rule was variable (indirect effect = -.13, 95% CI: -.25, -.04), but had no effect when the rule was fixed (indirect effect = -.04, 95% CI: -.04, .14). There was no effect on motivation (p's > .60).

Through the lens of political ideology, three studies demonstrate a downside to self-control success. Specifically, conservatives' ability to strictly adhere to a decision rule (i.e., inhibition) impaired their ability to modify that rule when necessary (i.e., updating). This struggle manifested in greater feelings of frustration which mediated conservatives' impaired performance. Moreover, these findings occurred across distinct samples and methodologies and were independent of alternative explanations related to motivation, intelligence, religiosity, task complexity, or demographics. Despite the clear functional and beneficial qualities of self-control, this research demonstrates that the processes which facilitate self-control success come at the expense of modifying habits to situational demands.

Building on these findings, this research provides novel insight for future research. Specifically, self-control is construed as an adaptive executive function critical to foundational regulatory processes (Vohs & Baumeister, 2016) that hold direct import for consumer behavior (Baumeister, 2002). Furthermore, these findings provide a framework by which to explore alternative cognitive costs elicited from the processes that promote self-control success. For instance, what happens when consumers try to break a bad habit? Should consumers seek out self-improvement regimens (e.g., dieting plans) that facilitate a match between their ideology and the amount of updating or inhibition required? Lastly, ideology research has predominantly differentiated conservatives and liberals on a motivational basis (see Jost et al., 2003), this work explores an alternative, cognitive-based perspective which offers novel predictions based on a unique means by which to differentiate conservatives and liberals.

Advertising Co-created New Products: An Exploration
of Consumer Responses and Success Contingencies

Fanny Cambier, NEOMA Business School, France
Ingrid Poncin, Université Catholique de Louvain, Belgium

EXTENDED ABSTRACT

Co-created new products are increasingly popular but their failure rate is sobering; traditional advertising techniques may be inadequate to stimulate adoption. This qualitative study reveals that consumers responses are contingent upon eight aspects differently combining with a "made-with-consumers" claim and pertain to perceived claim veracity, brand integrity and action meaningfulness.

Introduction

Globally, 78% of large companies (e.g. Lego, Volkswagen, and PepsiCo) have already used consumer empowerment strategies (CES) for new product development (Wang et al., 2019). Many of them have then advertised the resulting new products as "made-with-consumers". CES refer to a form of co-creation of new products and services, in which companies provide a platform to involve their consumers and collect their input (e.g. ideas or votes), then market most promising idea(s) into finished product(s) (Fuchs and Schreier, 2011) and may advertise them as such (Nishikawa et al., 2017). CES reflect a new paradigm, where the firm is no longer solely responsible for value creation (Ramaswamy and Ozcan, 2014).

However, the return on investment of these new products is not always satisfactory; their failure rate is sobering (Wang et al., 2019), despite the fact that "made-with-consumers" products usually better fit consumer needs (Poetz and Schreier, 2012). Marketing communication, another key lever for driving product adoption (Bruhn and Ahlers, 2017), might then be inadequate or suboptimal (Wang et al., 2019). Surprisingly, however, brand audiences' interpretations and judgements about CES advertising have not received much attention so far. Rooted in the innovation literature, previous research has mostly focused on the presence versus absence of "made-with-consumers" labels (Nishikawa et al., 2017). Knowledge gaps persist because advertising research has largely ignored this field of research; The examination of advertising characteristics (e.g., modalities, message information, source credibility) known to influence consumer advertising responses (Batra and Keller, 2016) remains underexplored.

This research therefore aims to further understand which aspects of CES advertising trigger brand audiences' interpretations and judgements and the nature of these interpretations and judgements.

Literature Review

A first line of innovation research shows that firms derive competitive advantage from CES because resulting products better meet consumer needs (Poetz and Schreier 2012). Other research focuses on the participants' overall experience of empowerment (Hoyer et al., 2010) and shed light on enhanced brand relationships after participation in CES (Füller et al., 2009; Bendapudi and Leone, 2003). A third, burgeoning, line of research focuses on the larger group of non-participating consumers (i.e. brand audiences, exposed to marketing communications with "made-with-consumers" claims). This research focuses on this group.

Previous research focused primarily on benefits (Gemser and Park, 2015) and consistently showed that demand for "made-with-consumers" products is higher than for traditionally designer-made products (e.g. Nishikawa et al., 2017). Current consumer distrust in advertising claims might suggest though that such claims could also be perceived as a marketing ploy (Acar and Puntoni, 2016) used to produce undue positive brand associations (Thompson and Malaviya, 2013). Brand audiences may also believe in the brand's interest -as a business entity aimed at making profits- to distort the empowerment message for greater persuasiveness. Uncertainty about firms' ulterior motives might then induce perceptions of information asymmetry that consumers will try to mitigate (Jeon and Menicucci, 2008). Signaling theory (Spence, 1973) foresees that, in case of information asymmetry, the less informed party will look for extrinsic clues from which they can infer quality heuristically (Kirmani and Rao, 2000). These cues -or signals- only work to the extent that consumers deem them both useful and credible (Boulding and Kirmani, 1993).

Previous research identified product-related moderating effects: complexity (Schreier et al., 2012; Meissner et al., 2017) and category (i.e. luxury fashion industry; Fuchs et al., 2013). Closer to an advertising perspective, Wang et al (2019) present the winning consumer's story to be an influential signal. It is the only study that offers concrete recommendations for designing a persuasive CES message; yet, due to its unique characteristics (e.g. brand and consumers as product designers simultaneously) effective CES advertising might differ from traditional advertising techniques.

Much is still to learn about other influential aspects and how these aspects interact with 'made-with-consumers' claims.

Method

An exploratory qualitative research was conducted to identify influential aspects and brand audiences' interpretations and judgments. Qualitative research allows delve deeper into how brand audiences read and judge advertisements (Belk, 2017). Specifically, twenty-eight individual interviews and three group interviews (five, six and nine informants) were conducted. Widely used in advertising and marketing research, group interviews actively compare informants' opinions and experiences and stimulate more natural group discussions (Belk, 2017). Individual interviews allow reveal realities that deepen consumers' experiences, to assess the subtle links between concepts of interest (Malhotra, 2010) and to overcome the group thinking, moderator biases and dominant individual discussions that are common in group interviews (Belk, 2017). Thus, each method used here attempted to compensate for the biases of the other.

Informants (non-participating consumers/brand audiences) were recruited out of friendship, kinship or acquaintance and have never participated in CES; they were all French-speaking adults, aged 19 to 68 (see Table 2), from different social backgrounds. Their field of study, profession and lifestyle varied, although the majority had a university degree. Interviews were conducted on campus or at the informants' homes, at their convenience and lasted. Each semi-structured interview lasted between 32 and 120 minutes and each group interview lasted two hours. A total of forty-eight informants contributed to the verbatim data collected.

Both authors conducted the interviews. The semi-structured guide used a funnel approach; questions initially focused on general themes but gradually became more specific. After the introductory part, three main sections followed: (1) exploration of informants' general knowledge and interpretations about CES, (2) examination

of spontaneous responses to "made-with-consumers" products and their advertising (informants were exposed to a variety of printed stimuli), (3) exploration of behavioral judgements and intentions towards the advertising brand. Projection techniques such as sentence completion and word association complemented the animation guide for group interviews, aiming to reveal unarticulated feelings, overcome social desirability and inhibition, and inject variation and pleasure into the interview process (Belk, 2017).

All interviews were audio- or video-recorded, transcribed in full and coded using NVivo 11 software using an inductive approach. First, emerging themes were identified from the data by noting instances and patterns (LeCompte and Schensul, 1999). Specifically, the first author and three research assistants independently identified all instances of responses, interpretations and judgments towards CES and created reflective coding. Each analyst provided the second author with the finalized coding sheets, who audited the emergent categories and coding and provided additional insights. While informant data served as the primary source for differentiating responses and judgements, the consumer empowerment literature was used in an iterative process to compare emerging areas of consumer judgements and triggers to previous research. Saturation was reached when the repetitive comparison of themes and relationships no longer produced new ideas. This iterative process allowed move from data to identification of emerging patterns and contributed to a more refined understanding (Belk, 2013).

Results

Characteristics of brand audience responses

In line with previous research (e.g. Fuchs and Schreier 2011), CES advertising generates interest and positive judgements; the openness of internal innovation processes to consumers evidences how valuable consumers can be for the empowering brand.

The data content analysis also revealed negative interpretations and judgments, thereby refining and complementing extant literature. Doubts about the actual control, influence and impact that consumers had throughout the CES process are commonly cited. The veracity of the "made-with-consumers" claim is often questioned, suggesting a need to strengthen it in marketing communication (i.e. improving perceived empowerment). The alignment between the brand's advertising claim and the actual actions of the brand throughout the process (i.e. brand integrity) is expected but also often questioned. Resulting are differential indirect impacts on declared behavioral intentions. These emerging findings underline the growing, but still under-explored, importance as influential persuasion variables of brand integrity and claim veracity perceptions (enhanced empowerment perceptions).

The data reveal that these interpretations and judgements depend on a series of aspects that brand audiences rely one to give evaluate the veracity of the "made-with-consumers" claim; they can or would like to find these aspects in the advertising copy. The combination and juxtaposition of these additional signals with the primary "made-with-consumers" claim are found to influence the perceived quality of the "made-with-consumer" claim and thus, advertising effectiveness.

Success contingencies to CES advertising

Eight aspects of CES advertising triggering brand audiences' interpretations and judgements emerge from the verbatim: brand size/importance, winner identification, brand reputation, empowerment signals, type of empowerment platform, monetary rewards, brand process transparency, and CES purpose. Liljedal (2016) framework of CES dimensions provides a relevant framework for identifying

and organizing signals from which to infer quality of 'made-with-consumers' claims. These dimensions concern "who" (the interacting parties, an empowering brand and participating consumers), "what" (an outcome in the form of a new product or service) and "how" (a series of actions or steps constituting the CES-based innovation process).

Only one aspect here pertains to what (CES purpose) while three aspects (brand size/importance, winner identification, brand reputation) reflect 'who'. Importantly, four aspects (empowerment signals, type of empowerment platform, monetary rewards and brand process transparency) relate to 'how', showing that interpretations and judgments are contingent upon the additional information found about the process. Given the short length of this paper, only these four aspects are described below; each of them appeared more than once in the verbatim. Table 1 encapsulates illustrative quotes for the eight aspects though.

Empowerment signals. The verbatim reflects that a visible CES follow-up (e.g. result communication) reinforces perceptions of actual consumer listening and consumer voice valuation. Doubts arise when informants do not see or believe in the implementation of the empowerment contract with consumers. Three forms of contract non-execution emerge: 1) failure to follow up/non-execution of consumer ideas, 2) execution of an idea other than the one chosen, for reasons of feasibility or brand positioning, 3) rule changes along the way. V. (female, 36) tells her disappointment about a local food cooperative that initially asked its consumers to vote for two local producers; The products of the two elected producers would then be added to the cooperative's available range (see Table 1).

Brand process transparency. Informants are willing to diagnose between "empowering" brands only interested in image improvement and brands that truly value their consumers' voices and impacts. Informants express their desire to know about CES rules and processual steps, for instance: why ideas get chosen, which criteria are in place, who may participate, whether participants receive feedback and what happens to ideas that are not selected. Brand process transparency has positive signaling effects on perceived empowerment and brand integrity (Authors, 2020)

Type of empowerment platforms. Permanent platforms "à-la-Lego" evoke more spontaneous, higher-quality ideas aimed at improving a company's offering (i.e. more effective listening and true consumer empowerment). "Made-with-consumers" claims related to temporary platforms evoke large marketing campaigns and sales tactics only aimed at recruiting new consumers.

Monetary rewards. Informants spontaneously picked the absence or presence of financial reward given to the winning consumer and differentially interpreted it. For CES without rewards, informants interpret participants' search for ideas as a sign of willingness to engage with the brand; conversely, informants negatively associate rewards with participants' financial motivation, overriding perceptions of value co-creation. CES with rewards are negatively associated with consumers who are not primarily interested in helping the brand but in financial rewards.

Discussion

Through a qualitative inquiry, this research aimed to further the understanding of brand audiences' interpretations and judgments toward CES advertising and the aspects triggering these interpretations and judgments. The sobering failure rate of new co-created products and the potential inadequacy of traditional advertising methods to encourage co-created product adoption motivated this research, especially given the current literature gaps.

The findings have implications for both research and practice. First, this research reveals that the relatively new use of a "made-with-consumers" claims may generate brand audiences' wariness and questioning. This result contrasts with previous experimental research (e.g. Schreier et al., 2012; Fuchs and Schreier, 2011) where "made-with-consumers" labels produced positive brand associations and increased demand. The results show that tensions and wariness can emerge between brands and consumers, particularly in the management of the process and the achieved outcomes. It was here observed in the interviews that informants -before forging judgments- consistently searched signals giving substance -"reasons-to-believe"- to empowerment claims and inducing brand integrity. However, while certain signals placed next to the "made-with-consumers" claims may reassure (e.g. brand process transparency), integrating other signals may diminish the persuasive effect of a "made-with-consumers" claim (e.g. "one-off" nature of the platform) and create wariness toward actual empowerment and brand integrity. This raises many questions, requiring deeper investigation, about the appropriate use of the CES as a signal in advertising.

Second, extant literature gives brand audiences a passive role in CES: no presence on the empowerment platforms, no impact on performances (Pine and Gilmore, 1998), and no role in decision-making (Le Nagard and Reniou, 2013). This research instead shows that brand audiences may have the ability to change the brand-participants dynamics; the knowledge of their interpretations and judgments and the nature of the aspects triggering these may inform on how to design CES as an innovation practice. CES specifications, platform informational content and brands behaviors and interactions throughout the CES-related innovation processes might then be conceived upstream in accordance with brand audience concerns downstream. From there might result more integrated innovation and advertising strategies, towards enhanced adoption of new products.

This research bridges innovation and advertising literatures and contributes to both. First, this research integrates CES as a form of advertising stimulus that triggers brand audience responses. The original and novel aspects herein identified inform advertising research about new credible signals able to increase perceived quality of a "made-with-consumers" claim.

In persuasion literature, a large majority of the investigated advertising effects stem from classical persuasion measures such as, recognition, recall, brand attitudes and ad liking (Dahlen and Rosengren, 2016). This research opens the importance of alternative persuasion mechanisms in advertising research (e.g. perceived brand integrity and claim veracity). Besides, the synthesis of brand audience responses to CES-related advertising as well as the factors triggering these responses converge towards an expressed need to give CES meaningfulness. These findings open up alternative paths from advertising to purchase, in line with Batra and Keller (2016).

While recognizing advertising as a key lever to encourage new product adoption (Wang et al., 2019), much CES research has largely ignored the variety of advertising characteristics that can modulate brand audience responses to CES advertising. As a result, knowledge is mostly limited to effects stemming from the presence or absence of a "made-with-consumers" claim. This research thus also contributes to consumer empowerment literature. First, it gives some insights to answer Nishikawa et al. (2017)'s call for research by drawing up a detailed inventory of contingencies surrounding the mere "made-with-consumers" claim effect. Besides, by highlighting negative brand audience interpretations and judgments towards CES advertising and the paradoxical tensions that emerge in the brand-consumer relationship, this study valuably complements previous research that is mostly focused on CES benefits (Gemser and Parks, 2015). It also opens up avenues of research on what can be done to reduce brand scepticism and resistance in this context.

However, the interview guides -although as non-directive as possible- may have elicited interpretations and judgments that would have been undetectable in a more spontaneous and observational context. Besides, all identified aspects may combine and juxtapose differently with the "made-with-consumers" claim and potentially with other situational factors (e.g., disruptive innovation vs. line extension). That is why the present research represents a starting point to a larger project. In fact, based on the aspects deduced from the qualitative inquiry, follow-up studies will be conducted to further assess the signaling values of these aspects, and the relationships between these signals and the mechanisms discussed in this paper will be examined.

Doing the Dirty Work For The Sharing Economy: Building Trust With Consumers In Emerging Markets

Mario Campana, Goldsmiths, University of London, UK
Adèle Gruen, Goldsmiths, University of London, UK
Luciana Velloso, Goldsmiths, University of London, UK

EXTENDED ABSTRACT

The sharing economy is disrupting industries, redefining jobs, and creating new consumption practices (Belk 2010, 2014; Schor 2016), confronting service providers with many trust-related challenges (Eckhardt et al. 2019). In emerging markets, these challenges are aggravated by the nascent digital economies and the lack of established institutions, which increase consumers' uncertainty and risk perceptions (Al-Khouri 2012; Chen and Wang 2019; Baz Radwan et al. 2019). Hence, building trust takes on paramount importance for service providers in emerging markets.

The process of developing trust with consumers in these challenging environments remains largely underexplored within the sharing-economy literature (Chen and Wang 2019; Baz Radwan et al. 2019; Ter Huurne et al. 2017). We redress this gap by employing an institutional theory perspective to investigate: *What types of work do sharing-economy service providers undertake to build trust with their consumers in emerging markets?* We conducted qualitative research in Chile, which has one of the lowest trust levels worldwide (OECD 2016). The digital infrastructure is still developing (OECD 2018) despite governmental attempts to boost the digital agenda.

We focused on the carsharing company Awto. Founded in 2016, Awto is currently the largest carsharing company in Chile and the second largest in Latin America. We conducted 20 in-depth interviews with 15 Awto costumers and five nonusers who had experienced other shared-mobility services in Santiago (e.g., Uber), complemented by archival data. We performed an inductive qualitative thematic analysis (Spiggle 1994), where three types of work emerged: *humanizing*, *localizing*, and *risk bearing*.

Humanizing gives the marketplace interactions a human appeal. Friendliness and the ability to talk face-to-face with staff are crucial to fostering trust in emerging markets. The close ties that consumers develop with employees (to the point of using nicknames) go beyond simple transactional bonds, which are usually associated with the sharing economy (Bardhi and Eckhardt 2012, 2017; Ravenelle 2020). As Diana exemplifies: "I trust [Awto] 100%. The difference from the rest is that Awto has a person behind it. In Latin-American cultures, we need a face behind businesses." This need to experience human connections in order to trust the service is a unique characteristic of low-trust contexts. Humanizing the carsharing system is furthered by the development of bonds with nonhuman actors (i.e., cars) through anthropomorphism. Using Chilean names (e.g., Valentina) enables consumers to imbue the cars with human characteristics (Hoffman and Novak 2018), as Adela recalls: "the other day, I went with Arturo to see my mother, and it was so cute! I even said 'hi' to it." Anthropomorphism improves consumers' experience with the service (Hoffman and Novak 2018) and enables customers to develop familiarity and emotional bonds with the cars.

Localizing means establishing deep roots in the geographical and sociocultural context. This involves being physically present in consumers' surroundings through their open headquarters and street visibility. Jeronimo explains that a solid digital presence was not enough to convince him that Awto was trustworthy: "Awto doesn't make me scared because an internet search took me to a safe website, and after I *obviously* stopped by their office to check" (emphasis added). Having a local, visible, and accessible presence seems

fundamental. Furthermore, Awto strategically emphasizes its local roots, forging a sense of closeness with its consumers. Informants compared Awto with foreign platforms, expressing trust in Awto for being a Chilean enterprise. Awto works to solve local issues associated with the city's transportation system by reducing congestion and facilitating parking ('Move smart' is their tagline). As carsharing gets implemented, it acquires representations of a smart, urban service that helps consumers overcome local challenges.

Risk bearing consists of carefully designing operations to absorb a significant amount of the risk consumers in emerging markets associate with the sharing economy. Awto shifts the burden of ownership (Schaefers et al. 2016; Lawson et al. 2016) and the stress of dealing with service failures from consumers to them. Awto opted for owning a vehicle fleet rather than incentivizing consumers to rent out their own cars, and operates a station-based carsharing model to help users deal with the safety and space challenges in Santiago. Our interviewees reveal that these risk-bearing choices entice them to make a leap of faith (Brownlie and Howson 2005) towards carsharing: "I don't worry about anything. I mean, there's always a risk, but the insurance is under [Awto's] name, that is, they take care of everything. They bear the risks" (Victor). Awto also responsibilizes consumers by implementing punishments (e.g., for insufficient cleaning or smoking) and rewards (e.g., free half hour if the car is cleaned). The main difference between developed and emerging markets lies in the extent to which this can be implemented. Beyond a certain point, Awto must take a leap of faith and give users the benefit of the doubt: "I noticed there was a dent I hadn't reported. If they say something, I will say that it wasn't me and they'll have to believe me" (Carmen). Carmen expects Awto to take her word. By taking a leap of faith, Awto encourages customers to reciprocate the trust demonstrated by the company.

We contribute to the literature on trust within the sharing economy by showing that companies in emerging markets should work to make the service visible to consumers and offer solutions to local needs. We argue that these services should bear the risks associated with sharing to encourage users to trust the organization. Our findings go against the trend of overdigitalizing customer relationships (Möhlmann et al. 2019). Consumers' desire to engage with Awto at a human level (not just through a faceless platform) provides nuance to previous research (Bardhi and Eckhardt 2012; Gruen 2017).

We also extend the knowledge on how service providers initiate and implement market change (Baker et al. 2019; Wieland et al. 2016). Awto's trust-building work changes consumers' risk perceptions and negative impressions of sharing-economy services, which allows carsharing to be seen as capable of solving local structural problems. Awto is, therefore, performing the "dirty work," that is, the unpleasant, difficult work of changing taken-for-granted belief systems about mobility. They act as market-makers (Chen and Wang 2019; Humphreys 2010) by fashioning a space for carsharing that did not exist before.

Core Stigma and the Consumption of RuPaul's Drag Race

Mario Campana, Goldsmiths, University of London, UK
Katherine Duffy, University of Glasgow, UK
Maria Rita Micheli, IESEG School of Management, France

EXTENDED ABSTRACT

This paper assesses the consumption of RuPaul's Drag Race as a stigmatized serial brand (Parmentier and Fischer 2015) building success on the active spectacularization of its core stigma. In CCT research, stigma has mostly been studied as something consumers need to conceal or manage (Goffman 1962/2009), exploring how consumption practices and objects can be destigmatized (e.g. Sandikci and Ger 2010), leading to the legitimization of markets and brand image (Giesler 2012, Humphreys 2010). However, research has stopped short of exploring how stigmatized brands can find space in the mainstream marketplace by actively promoting and performing their stigma, instead of concealing it.

Drag queens, the protagonists of RuPaul's Drag Race, have always suffered from a "double stigma" (Berkowitz et al. 2007) from both LGBTQ+ and non-LGBTQ+ audiences. The generalized stigma derives from the fact that drag queens are men who "publicly perform being women in front of an audience that knows they are 'men,' regardless of how compellingly female they might otherwise appear" (Schacht and Underwood 2004, 4). This transgressive behavior destabilizes the performance of gender and sexuality, crossing the boundaries of the social constructions of masculinity, femininity, homosexuality, and heterosexuality (Berkowitz and Liska Belgrave 2010; Taylor and Rupp 2004). Research has emphasized these elements as emblematic of the stigma from the heterosexual community against the LGBTQ+ community (Tewksbury 1994); in turn, these elements also lead the LGBTQ+ community to isolate drag queens, marginalizing them as outcasts (Berkowitz et al. 2007).

In exploring Drag Race as a stigmatized serial brand (Parmentier and Fischer 2015) we explore how it has managed to build success through an active performance of core stigma (Hudson 2008), with performances during the show and the use of a specific language. Our research revolves around questioning: *How can brands succeed by performing their stigma? How do different audiences, such as media and consumers, contribute to the performance of the stigma?*

We conducted a qualitative and an automated text analysis (Humphreys and Wang 2018; Caliandro and Gandini 2017) on data from several online sources: 3,605 statuses (since 2009) from the Facebook page of Drag Race, 5,644 articles from newspapers and magazines worldwide, and around 1,000,000 tweets between 2014 and 2019 following the hashtag #DragRace. We specifically searched for stigma associated with different transgressions related to gender and sexuality, reflecting the stigma of drag queens (Berkowitz et al. 2007).

We find that the brand did not conceal stigmatized elements in its discourses, in turn, it spectacularized them through different channels (e.g. Facebook, Twitter). We define spectacularization as a way of representing transgressions and deviant behaviors of the brand, or individuals associated with it, in the form of a spectacle. With the qualitative analysis, we identify three main spectacularized transgressions. Firstly, a transgression of gender norms whereby the multifaceted nature of drag gender appears across a spectrum (*glamor*):

Drag loses its sense of danger and its sense of irony once it's not men doing it, because at its core it's a social statement and a big F-you to male-dominated culture. So, for men to do it, it's really punk rock, because it's a real rejection of masculinity. The Guardian (March 3, 2018)

Although the article above highlights the tensions of discussing gender in Drag Race, it describes the transgression of gender norms as a key spectacularized topic. This can vary from looking very feminine (defined as *fishy* in the show), to looking androgynous, or showing more masculine traits (e.g. *butch queens*), to looking very queer or gender non-conforming, to looking like a glamor diva.

Secondly, in the show, we find a transgression of societal mores through using comedy and crassness in subverting accepted social codes and conventions (*comedy*). The same discourses are also in the media, as Vulture (*February 10th, 2017*) exemplifies:

Comic sensibility has become enshrined in RuPaul's Drag Race [...] That disregard for social conventions, though, has also been what has gotten RuPaul into trouble. [...] Some online trans activists took umbrage at the regular joke on RuPaul's Drag Race, "Ooh girl. You've got she-mail!" when the contestants would get a pun-filled video message from RuPaul about the day's challenge. [...] Eventually the joke was taken out and replaced.

Thirdly, we identify a transgression in which the creation of a parallel social world facilitates social categories to be transgressed (*realness*). Drag Race is inspired by *Paris is Burning* and underground ballroom culture. In the Nineties, balls were underground gatherings of LGBTQ+ individuals, mostly belonging to ethnic minorities, competing in 'walking' categories. One of the judging criteria was the "realness", in reference to the appropriateness of the look to the category, and the credibility. The Drag Race brand spectacularizes the 'realness' transgression, as Wired (2018) shows:

Yet, for many, that slang— 'work,' 'gagging,' 'eleganza,' 'hunty'—has been stripped of valuable context. Borrowing and stealing language, especially from communities of color, has been going on for a long time [...] And the vernacular of drag culture has been absorbed so quickly that few even know where the terms originated.

Overall, through spectacularization, discourses and meanings belonging to an underground stigmatized culture has become absorbed into mainstream culture.

We used these three transgressions as the basis for the automated analysis. We created three dictionaries associating words to each of the transgressions. For example, we associated the words 'work', 'gagging' or 'eleganza' to the 'realness' dictionary/transgression. We then mechanically searched the three transgressions in the tweets and in the articles. As table 1 shows, the brand, the consumers and media actively use these transgressions in their discourses. We also observe a similar longitudinal trend of the transgressions, seeing their use increasing after 2016[1]. As the show reaches mainstream audiences, the transgressions related to stigma evolve into mass culture. Overall, different audiences (i.e. consumers on Twitter, and media) become part of this spectacularization, contributing to reinforce the presence of stigma within discourses.

We contribute to research on how stigmatized brands can thrive within the mainstream marketplace (e.g. Scaraboto and Fischer 2013) and to research on multidimensionality and instability of stigma (e.g. Hudson 2008). We extend this research by exploring how brands can spectacularize stigma through an active showcasing of transgressions of societal norms, without trying to conceal or reduce stigmatized elements. We also show how audiences differ in the per-

---

1   In September 2016 the show moves from a niche TV channel, Logo TV, aimed at LGBTQ+ consumers and audiences, to a mainstream channel, VH1.

ception of stigma and in the way they react to stigma spectacularization. Overall, we present spectacularization as a way to normalize stigma by entering everyday discourses of different audiences, familiarizing with stigma and reducing brand distance.

When and Why Physical Strength Increases or Decreases Persuadability

Margaret C. Campbell, University of Colorado, USA
Irene Consiglio, Nova School of Business and Economics, Portugal
Stijn M. J. van Osselaer, Cornell University, USA

EXTENDED ABSTRACT

The majority of people predicts that it is easier to persuade a weaker (vs. stronger) person (pilot study 1). However, we propose the opposite. Our predictions rest on the notion that humans have a threat detection system, scanning the environment for potential threats (Holbrook, Sousa, and Hahn-Holbrook 2011). Weaker (vs. stronger) individuals are more vigilant towards threats, because an underestimation of danger puts them at a greater risk of injury (Fessler, Holbrook and Gervais 2014). This threat detection system may involve also the detection of persuasion. Indeed, persuasion is conceived as a threat (e.g., to the self, or freedom of choice; Brehm and Brehm 1981), and in order to defend themselves, individuals are vigilant against persuasive intent (Campbell 1995; Campbell and Kirmani 2000). We propose that weaker (vs. stronger) individuals' sensitivity to threats makes them relatively more (vs. less) vigilant against and resistant to persuasion.

Five studies tested these predictions. In study 1A (N = 100, M_{age} = 35.10, SD = 10.28; 41% males; MTurk), respondents imagined an interaction with a salesclerk and answered four vigilance items (e.g., "The salesclerk is likely to have an ulterior motive for helping me" (1 = *Strongly disagree*, 7 = *Strongly agree*). In an allegedly unrelated task, respondents rated their physical strength (1 = *I have absolutely no strength*, 7 = *I have exceptional strength*; Rahamni-Nia et al. 2011). As strength increased, vigilance decreased (r = -0.29; p = .01). This analysis excluded 15 participants who failed two preregistered attention checks. The effect is stronger including all participants.

In study 1B (N = 120; M_{age} = 37.53; 43.3% male; MTurk), we manipulated strength: participants in the weakness [strength] condition read that the best [worst] performers in their age group could do more than 47 [barely 3] push-ups in 1 minute; next, they completed a vigilance measure as in study 1A. Participants felt stronger in the strength (vs. weakness) condition (M = 4.61, SD = 1.71 vs. M = 2.45, SD = 1.53; t(97) = 6.98, p < .001). Participants in the strength (vs. weakness) condition were less vigilant (M = 3.83, SD = 1.14 vs. M = 4.24, SD = 0.92; t(97) = -2.06; p = .04). This analysis excluded 21 participants who failed two preregistered attention checks. Analysis of all the respondents showed the same pattern, but the effect of strength was not significant (p = .11).

In study 2, participants (N = 145; M_{age} = 36.37; 53.8% male; MTurk) wrote about a situation in which they felt physically weak, or strong, or a typical day. Next, they watched an infomercial and reported their purchase intentions (3 items; e.g., "If I needed/wanted a TV… I would be likely to buy the Panasonic AS640;" 1 = *Strongly disagree*, 7 = *Strongly agree*) and brand attitudes (6 items; e.g., "The Panasonic AS640 is…" 1 = *Unappealing*, 7 = *Appealing*; adapted from Meyers-Levy and Peracchio 1995). Participants who recalled being strong expressed higher purchase intentions (M = 5.73, SD = 0.86) than participants who recalled being weak (M = 4.98, SD = 1.63, p < .01), or a typical day (M = 5.02, SD = 1.45; p = .01; F = 4.65, p = 0.01). The control and weakness condition did not differ (p > .88). The analysis of brand attitudes revealed a similar pattern.

In study 3, respondents (N = 200; M_{age} = 33.84; 61% male; MTurk) completed a strength measure (see study 1A). Next, they saw five wine pairs and indicated their preference for one wine in each pair after reading an alleged expert's advice (knowing that a random winner would receive a chosen wine). Finally, they indicated if they perceived the expert as manipulative (our vigilance measure; 1 = *Extremely sincere/manipulative*, 7 = *Not sincere/manipulative at all*; Campbell & Kirmani 2000). Strength had a positive effect on the number of times participants chose a recommended wine (B = 0.21, t(147) = 2.36, p = .02; R^2 = 0.04, F(1, 147) = 5.56, p = .02). Moreover, as strength increased, vigilance decreased (B = -0.13, t(146) = -1.67, p = .10; R^2 = 0.02, F(1,146) = 2.78, p = .10), and this, in turn, increased advice taking (LLCI > 0, ULCI = 0.12; 90% bootstrap confidence interval). These results exclude participants who opted out of the lottery. Including all participants reinforces the mediation pattern (LLCI > 0, ULCI = 0.11; 95% bootstrap confidence interval).

In study 4, we tested the role of persuasion salience. Participants (N = 304; M_{age} = 37.11; 51.3% male; MTurk) completed a manipulation of strength (see study 1B) and read either a commercial written by an advertising agency (*high salience*), or a review written by an independent agency (*low salience*). Finally, participants filled in their purchase intentions (see study 2). Participants in the strength (vs. weakness) condition felt stronger (M = 4.98, SD = 1.43; vs. M = 2.66, SD = 1.24; t(302) = 15.08, p < .001). Stronger participants indicated higher purchase intentions when persuasion was less (M = 4.89, SD = 1.15) versus more salient (M = 3.87, SD = 1.20; F(1, 221) = 17.00, p < .001). Salience did not affect weaker participants (F(1, 221) = 1.33, p = .25; interaction: F(1, 221) = 5.00, p = .03). These results exclude participants who failed a preregistered attention check. Including them makes the interaction not significant (p = .32). These results suggest that stronger individuals are less persuadable when persuasion is blatant: when stronger people detect persuasion, they react negatively to it; instead, weaker people might be generally more vigilant.

This research has important implications. If weaker people resist persuasion, it might be problematic—imagine failing to convince frail elderly parents to take their medication. More broadly, patients often get medical advice while in a state of physical weakness. Moreover, strong individuals are malleable with mild persuasion tactics, but may be resistant to overt persuasion attempts. Thus, this research may aid consumer protection as it speaks to which fraudulent schemes different consumer groups are likely to succumb.

The Effect of AI on Selective Belief Updating

Cindy Candrian, University of Zurich, Switzerland
Anne Scherer, University of Zurich, Switzerland
René Algesheimer, University of Zurich, Switzerland

EXTENDED ABSTRACT

The optimism bias leads people to update beliefs more when receiving good versus bad news. This phenomenon is one of the most consistent, prevalent, and robust biases documented in research (Sharot 2011, 2012) and has been considered as one of the core causes of the financial downfall of 2008 (Shefrin 2010). While research on the optimism bias is extensive, the nature of the messenger has been neglected. Understanding if and how an optimism bias arises when users' prior beliefs are challenged by an artificial agent rather than a human is crucial, as the collaboration between humans and machines is increasingly becoming an everyday reality (Zamalloa et al. 2017). The present research hence aims to examine 1) if and 2) how AI agents affect peoples' belief updating tendencies.

Even when presented with accurate information, people fail to update their prior beliefs in light of undesirable information. Instead, when people are confronted with information that contradicts their beliefs, they respond with psychological reactance, which often surfaces in a negative attitude toward the message, a lower intention to comply, or a disregard for the advisor (Cohen 1962).

Psychological reactant behavior generally occurs when people experience a threat to their autonomy. This is the case, when people receive messages that are inconsistent with their goals and beliefs (Roseman 1996). It follows that undesirable information from an advisor should generally increase the level of perceived threat, which – in our case – surfaces in a resistance to incorporate new information into existing beliefs. Psychological reactance to a persuasive message also tends to be higher, the more social agency is attributed to the message source (i.e. the higher the degree to which an agent is perceived as a social entity) (Roubroeks, Ham, and Midden 2011). Taken together, we propose that learning rates will be higher for desirable advice rather than undesirable advice, but that this bias will be stronger, when the source of advice is a human rather than AI.

All studies in the present research used a well-established investment game to examine biases in belief updating.

Study 1 aims to establish the effect of human vs. AI advice on valence dependent belief updating. Participants were randomly assigned to one of four experimental conditions in a 2 x 2 full-factorial design, with nature of the message source (human/AI) and desirability of advice (desirable/undesirable) treated as between-subject factors. Our results confirm a valence dependent belief updating asymmetry ($F(1, 503) = 7.51$, $p = .006$). Learning rates for advice provided by a human were significantly lower when the information was undesirable ($M = 0.66$, $SD = 0.45$) rather than desirable ($M = 0.86$, $SD = 0.64$), $d = 0.19$. If the advisor was AI, the learning rates did not significantly differ between the undesirable and desirable advice condition ($M = 0.83$, $SD = 0.52$), $d = 0.07$.

Study 2 aims to examine if varying levels of psychological reactance to the advice and the advisor can explain how differences in the belief updating asymmetry between human and AI advisors arise. Study 2 parallels study 1 but included measures of perceived threat and social agency. Moderated mediation analysis following Preacher, Rucker and Hayes (2007) showed that positive (negative) information significantly reduces (increases) perceived threat to autonomy ($\beta = -.198$, $t(482) = -2.83$, $p = .004$) and the interaction of threat to autonomy and nature of the message source has a significant interaction effect on learning ($\beta = -0.07$, $t(482) = -2.90$, $p > .05$).

Study 3 examines liking, a well-known force towards compliance as it can decrease resistance to undesirable advice (Silvia 2005). Confirming the results of study 1 and 2, we find a valence dependent belief updating asymmetry an interaction of the information valence and the message source on learning. Moreover, results indicated a stronger change in liking in human interactions.

In study 4, we aim to test if AI advisors can still outperform human advisors when using a well-established persuasion technique in human-to-human interactions: Starting off on common grounds. We conducted a 2x2x2 experiment with nature of the message source (human/AI), information valence (undesirable/desirable) and persuasion (no common ground/with common ground) treated as between-subject factors. The results are in line with the previous three studies. Further, for both advisors, persuasion through common ground had no significant effect on learning rates, although learning rates with persuasion were slightly higher ($M = 0.62$, $SD = 0.63$) than without ($M = 0.55$, $SD = 0.74$) for the human advisor, $d = -0.06$.

Study 5 examines 1) if differential reactions to AI and human advice also lead to important behavioral differences and 2) if our results hold firm when inviting managers, who have to make decisions regularly in their job, to our study. Again, valence dependent belief updating was only present in the human condition. Further, loyalty intention towards a human advisor was significantly higher when information was desirable ($M = 4.56$, $SD = 1.36$) rather than undesirable ($M = 3.84$, $SD = 1.44$), $d = 0.77$. When the advisor was AI, loyalty intentions did not differ significantly between the undesirable and desirable advice ($M = 3.98$, $SD = 1.38$), $d = 0.15$. Further, when receiving desirable advice, loyalty was significantly higher when the advisor was human ($M = 4.56$, $SD = 1.36$) than when the advisor was AI ($M = 4.07$, $SD = 1.32$), $d = 0.55$.

The present research finds ample evidence for a valence dependent updating asymmetry in interactions with human advisors and a reduction of this bias in interactions with AI. We find that AI can reduce psychological reactance and in consequence increase learning. Especially in comparison to human advisors, users interacting with AI advisors have higher learning rates for undesirable information, which leads to less biased belief updating, or put differently, a lessening of the well-established optimism bias. These findings are highly relevant not only because they show the potential to reduce irrational risk-taking of individuals, but also because they can improve managerial decision making and contribute to a stable economy.

Gift Giving in Response to Others' Hardship:
The Role of Recipient Optimism versus Pessimism

Christopher Cannon, University of Hawaii, USA
Derek D. Rucker, Northwestern University, USA

EXTENDED ABSTRACT

Researchers have examined gift giving during special occasions, such as weddings or birthdays, as well as in everyday contexts, such as bonding with a friend (Chan and Mogilner 2017; Tifferet et al. 2018). However, the emphasis on such situations neglects, perhaps unintentionally, another important gifting context: hardships (for discussion, see Klein, Lowrey, and Otnes 2015). For example, a friend could lose his father, a co-worker could fall ill, or a family member could end a marriage. How do consumers provide gifts in response to hardship?

To answer this question, we examine an aspect that is fundamental to the experience of hardship: recipients' outlook on their hardship. Optimistic people believe that, despite the hardship, future events will go favorably, whereas pessimistic people believe that, in addition to the hardship, future events will go unfavorably (Carver, Kus, and Scheier 1994). Importantly, we suggest that these two responses signal to others different needs in the recipient. In particular, we introduce the idea that gifts can be used to fulfill one of these needs. First, gifts can fulfill the need for affiliation—the desire for social connection (Hill 1987). Second, gifts can fulfill the need for nurturing—the desire for care and support from others (Cannon and Rucker 2020; McAdams et al. 1996).

We argue that optimism and pessimism in others can signal the need for affiliation versus nurturing. First, we predict that gift givers infer affiliation needs in optimistic others. In line with this, optimistic individuals frequently cope by seeking out social support (Scheier, Weintraub, and Carver 1986) and have a preference for engaging in social interactions (Terrill, Ruiz, and Garofalo 2010). Second, we predict that gift givers infer nurturing needs in pessimistic others. In line with this, pessimistic individuals are more submissive, which suggests they lack the agency to confront their own challenges (Smith et al. 2013), and frequently engage in avoidant behavior (Nes and Segerstrom 2006), which suggests the need for others' intervention and support.

Thus, we propose gift givers will choose gifts that fulfill these distinct needs. For optimistic recipients, we predict that gift givers will choose gifts that respond to a need for affiliation. This can include both experiential (e.g., paint night with friends) and material gifts (e.g., family board game). For pessimistic recipients, we predict that gift givers will choose gifts that respond to a need for nurturing. This can also include both experiential (e.g., spa treatment) and material gifts (e.g., hand soap that supports clean water initiatives).

In experiment 1, MTurk participants ($N = 202$) were randomly assigned to a 3-cell (recipient outlook: optimistic, pessimistic, vs. no hardship) between-subjects design. In the optimistic (vs. pessimistic) condition, participants read a scenario where their co-worker, Jennifer, was optimistic (vs. pessimistic) about her Crohn's disease diagnosis. In the no hardship condition, Jennifer was not diagnosed with Crohn's disease. Participants chose one of three gift baskets: a control gift basket (e.g., gourmet fruits and jams), an affiliation gift basket (e.g., paint night with a group of friends), and a nurturing gift basket (e.g., hand soap that supports clean water initiatives). Participants shifted preferences between affiliation and nurturing gifts depending on the recipient's outlook ($^2 = 9.40$, $p = .052$). More participants chose the affiliation gift basket (52%) for the optimistic recipient than either the nurturing (29%; $p = .027$) or control gift

baskets (19%; $p < .001$). In contrast, more participants chose the nurturing gift basket (51%) for the pessimistic recipient than either the affiliation (28%; $p = .036$) or control gift baskets (22%; $p = .006$). The same number of participants chose the affiliation and nurturing gift baskets for the recipient with no hardship.

In experiment 2, we provided evidence for the psychological mechanism. MTurk participants ($N = 201$) were asked to indicate their purchase intentions between the same affiliation and nurturing gift baskets (1 = definitely nurturing, 7 = definitely affiliation) for their co-worker, who was either optimistic or pessimistic about her diagnosis (see experiment 1). We also measured perceptions of the recipient's affiliation ($\alpha = .88$) and nurturing needs ($\alpha = .85$). In line with our hypothesis, affiliation versus nurturing needs mediated the effect of recipient outlook on gift giving ($B = .47$, $SE = .18$; 95% CI [.12, .84]).

In experiment 3, MTurk participants ($N = 200$) were randomly assigned to a 2-cell (recipient outlook: optimistic vs. pessimistic) between-subjects design. Participants read a scenario where their friend, Sarah, was either optimistic or pessimistic about her recent relationship rejection. Then, participants chose between two restaurant gift cards, framed in terms of affiliation (e.g., comfortable ambiance for conversion) and nurturing needs (e.g., waitstaff takes care of customer needs). More participants chose the affiliation (65%) over the nurturing framed gift card (35%) for the optimistic recipient ($p = .003$). In contrast, more participants chose the nurturing (65%) over the affiliation framed gift card (35%) for the optimistic recipient ($p = .003$).

In experiment 4 ($N = 300$), we increased the external validity of our findings by having participants purchase a gift for someone they personally know who is experiencing a hardship. In addition, we provided a boundary condition for our effects: social closeness (Aron, Aron, and Smollan 1992). In line with construal level theory (Trope and Liberman 2010), consumers should rely on the recipients' outlook more in their decision making for distant (vs. close) recipients. In support of this, gift givers were able to differentiate between the affiliation and nurturing needs for socially distant recipients because of their higher construal of the situation. In contrast, gift givers did not take into consideration the situational needs for close recipients.

In conclusion, consumers do not simply provide any gift as a gesture toward a person enduring hardship. A recipient's outlook on the hardship, and the corresponding psychological need inferred by the giver, plays an integral role in the gifts given. In doing so, the present work paves the way for more research to study both gift giving in times of others' hardship and how recipients' outlook ultimately informs and influences gift givers.

The Endowment Effect: Unique Predictions from a Cognitive Elaboration Account

Christopher Cannon, University of Hawaii, USA
Derek D. Rucker, Northwestern University, USA
David Gal, University of Illinois at Chicago, USA

EXTENDED ABSTRACT

The endowment effect is a phenomenon in which sellers have a higher valuation of their goods than buyers (Kahneman, Knetsch, and Thaler 1990, 1991). The term "endowment effect" was originally coined by Richard Thaler as a manifestation of prospect theory (Kahneman and Tversky 1979; Thaler 1980). The endowment effect has attracted significant scientific attention, with a multitude of distinct perspectives being offered to explain the endowment effect such as loss aversion (Thaler 1980), psychological inertia (Gal 2006), psychological ownership (Morewedge et al. 2009), and reference price theory (Weaver and Frederick 2012).

The present work introduces an additional, potentially powerful, yet entirely unexplored, explanation for the endowment effect: cognitive elaboration. According to the Elaboration Likelihood Model (ELM), attitudes can be formed and changed through two routes (Petty and Cacioppo 1986). Under high cognitive elaboration, people engage in the central route to processing; they carefully scrutinize the arguments presented in support of a message or product. Under low cognitive elaboration, people engage in the peripheral route to processing; they rely on simple heuristics and cues as opposed to the persuasiveness of the arguments.

We propose that buyers engage in more cognitive elaboration than sellers. Although neither proposed nor tested, a review of the literature provides evidence consistent with such a possibility. First, Petty and colleagues argue that the intention to purchase a product elicits high involvement and greater cognitive elaboration, whereas not needing to purchase a product leads to lower involvement and lower cognitive elaboration (Petty, Cacioppo, and Schumann 1983). Building on this perspective, one might expect that buyers—who might purchase the product—would be more involved than sellers—who already own the product. Second, as additional evidence, buyers (vs. sellers) appear to be more sensitive to the actual value of the good manipulated through product descriptions (Weaver and Frederick 2012).

If differences in cognitive elaboration exist between buyers and sellers, it follows that differences in participants' sensitivity to the quality of arguments should occur. Specifically, buyers, who are more attentive to the information about a prospective purchase, should exhibit a stronger response to whether the arguments in favor of a product are weak or strong (see Petty and Cacioppo 1986). In contrast, sellers, who are less attentive to the product, should be less sensitive to the quality of the arguments. Importantly, a cognitive elaboration account allows for novel theoretical predictions relative to all prior explanations of the endowment effect. Specifically, when argument quality is weak, the classic endowment should be observed: Selling prices should be higher than buying prices. However, when argument quality is strong, an elimination and even a reversal of the endowment should occur: Buying prices should be equal to or higher than selling prices.

We tested a cognitive elaboration account of the endowment effect across four experiments. In each experiment, MTurk participants were assigned to a 2 (endowment: buyer vs. seller) × 2 (argument strength: weak vs. strong) between-participant design. We varied the product category to demonstrate robustness across disparate types of products: smartwatch (experiment 1), cell phone (experiment 2), laundry detergent (experiment 3), and travel mug (experiment 4). In each experiment, we aimed to collect 300 participants to ensure a sufficiently large cell sizes. For the endowment conditions, buyers were asked to imagine that they are thinking about purchasing the product. Sellers were asked to imagine that they own the product and take it home with them. In the weak (vs. strong) argument condition, participants were given a list of features in favor of the product, but they were not particularly convincing (vs. exceptionally convincing). In each experiment, we measured WTP/WTA (i.e., measured on a sliding scale) and brand attitude (i.e., bad-good, negative-positive, and unfavorable-favorable). In experiments 2-4, we also measured favorability of thoughts generated about the product by having independent judges code the valence and relevance of the participants' listed thoughts.

Across four experiments ($N = 1200$), we demonstrate that sellers (vs. buyers) show decreased cognitive elaboration when forming product evaluations and determining reservation prices; see table 1. Moreover, we demonstrate that sellers (vs. buyers) show less sensitivity to argument strength. Therefore, when products were presented with weak arguments, selling price was significantly greater than buying price. However, when products were presented with strong arguments, buying price was equal to selling price (experiments 1, 3-4) and sometimes even greater than selling price (experiment 2). Moreover, as further evidence for a cognitive elaboration perspective, favorability of message-related thoughts mediated our effects. Buyers (vs. sellers) generated fewer favorable message-related thoughts when the product was framed in terms of weak arguments. However, buyers (vs. sellers) had more favorable message-related thoughts when the product was framed in terms of strong arguments.

In contrast to prior explanations of the endowment effect, such as loss aversion, psychological ownership, and psychological inertia, a cognitive elaboration perspective can offer new insights into when and why the endowment effect is (and *is not*) observed. Of course, these other accounts still offer insight into the endowment effect; however, the present experiments suggest such accounts are incomplete.

This work also opens up the possibility for future research. First, although we provide evidence that sellers engage in less cognitive elaboration than buyers, it is still an open question as to what peripheral cues sellers rely on to form judgments about products that they own. Likely, sellers rely on multiple different cues, such as reference prices (Weaver and Frederick 2012), the price of a similar product one owns (Hsee, Dubé, and Zhang 2008), or misattribution of affect (Shu and Peck 2011). Second, although our evidence suggests that buyers unilaterally engage in greater cognitive elaboration than sellers, there may be cases when the reverse is true. Future research could examine under which contexts sellers are more involved in determining reservation prices than buyers, such as when there is high competition among vendors in the marketplace. Overall, we hope this work inspires researchers to apply novel psychological perspectives to better understand the complexities of buyer-seller relationships.

EXTENDED ABSTRACT

Purpose

This paper aims to explore brand value embedded in street art from the perspective of urban artists, brand managers and final consumers. We argue that through the consumption of street art advertising, consumers, brands and community obtain valuable benefits.

Design/methodology/approach

In-depth interviews were conducted with urban artists, consumers and brand managers to explore the value of street art advertising.

Findings

This research shows that street art contributes to the communication of a brand because it stimulates sensory, intellectual and behavioral responses. Three main themes related to street art advertisement value and brand benefits emerged (a) Social connectedness and community bonding; (b) Imprinting an image of authenticity and coolness; and (c) Permeating an aura of beauty that engages consumers and provokes social dissemination of the brand. While urban artists and consumers focus in emotional and aesthetic benefits, brand managers perceive benefits in a utilitarian perspective, viewing brand as a networking tool for community transformation.

Originality/value

To the best of our knowledge, this is the first study to qualitatively analyze the brand benefits of urban art advertisement from the perspectives of artists, consumers and brands. This study provides insights into the benefits of urban art advertisement as compared to classical media.

Introduction

Urban art is a worldwide phenomenon where people come out to the streets to paint as a form of self-expression. Street painting in an elaborately creative manner is a powerful practice that is transforming the world. *Public art* has been defined as a public product of expression. It is a phenomenon of individual art deference into a collective society that indulges differences among individual as a manifestation of a communal spirit (Hein, 1996). The terms 'public art', 'urban art' and 'street art' often relate to diverse forms of 'art expression' that are embedded in public space. In this research, we refer to 'street art' as 'visual images that are *hand-painted* mainly on the walls of the street'.

Non-profit and for-profit organizations and governments use street art as a valuable resource. Previous research has examined *street art* or *urban art* and found evidence that urban art interventions effectively drive social transformation as social encounters promote engagement and emotional involvement (Gonzalez, 2017; Howes, 2005; Laurel; 1993). It also promotes community transformation as it improves district image, safety, services and capacities, covers commercial activities and improves local services (Perez, 2010). Moreover, some studies have confirmed that art and culture can help accomplish policy objectives related with economic development and neighborhood regeneration, hence promoting economic growth (Zukin, 1982; Markusen, 2006; Currid, 2009; Hartley, 2018). The global street art movement as an idea of illicit practice is losing its power as new perspectives emerges that encourages its coexistence with institutions such as government and the market (Visconti, 2010).

Thus, previous research has also focused on sociological aspects as a pedagogical vehicle that promotes learning about art and life skills with interaction and dialogue. These aspects include physical city reconstruction, community transformation and people's engagement in the educational value of urban art. In certain manifestations, urban art's economic value is raised by increasing urban artists' salaries and land value among others.

Street art and brands could seem an interesting fit. 'Companies around the globe are starting to implement street art as a branding strategy' (Borghini, 2010). Urban art's marketability has increased. 'The current interplay of commercial advertising and street art is fascinating' (Borghini, 2010). Young viewers that are tired of publicity are accepting this technique. 'The youngers have become less and less susceptible to traditional advertising' (Saucet, 2015), and brands are incorporating this phenomenon.

However, to the best of our knowledge little is known about the value of urban art advertisement for consumers and brands. This study seeks to extend previous research by qualitatively exploring this value from the perspective of urban artists, brand managers and final consumers. We argue that through the consumption of street art advertising, consumers, brands and community obtain valuable benefits as compared to classical media.

Theoretical Background

Aesthetics and Consumer Experience

People interact with the world through their basic senses that allow them to appreciate and survive in the world. Although humans experience more than five senses, the principle of the five basic human senses is traced back to Aristotle. This principle allows simple sensory categorization of in the complex world, namely, vision, smell, hearing, taste and touch (Kotler, 1973). According to Kotler, atmosphere has visual (color, brightness, size, shapes), aural (volume, pitch), olfactory (scent, freshness) and tactile dimensions (softness, smoothness, temperature). Reimann (2017) states that a better understanding of the interaction between aesthetic judgments, emotions, fluency, and the different senses should be the goal of future marketers and psychologist. The main idea is that stimuli provoke aesthetic judgements based on sense perception, ease of processing and aesthetic affect. These aspects respond to aesthetics, namely, judgement on other variables, the choice of an aesthetic object over other objects and decisions and performance in unrelated tasks. Responses could relate to the consumer decision and impact consumer experience. Consumer experience has been defined as 'an emergent property that results from a complex system of mutually overlapping interrelationships in constant reciprocal interaction with personal, environmental, and situational inputs' (Hirschman, 1986). Fournier (1998) identified that customers derive value from their experiences when they are strongly involved with brands. 'Brand Experience is conceptualized as the sensations, feelings, cognitions, and behavioral responses evoked by brand-related stimuli' (Brakus, 2009). Understanding consumers' brand experience and how they provide appealing brand experiences is critical for positioning and differentiating their brands (Schmitt, 2013). The branding literature has not focused

enough on multisensory brand experience and its impact on brand components perceived through the five senses. It can be argued that multisensory brand experience should be the basis for brand building and brand identity in creating brand image and loyalty (Hultén, 2011). How can art enhance the communication of a brand?

Art Infusion Effects

Based on marketing research, 'art infusion effect' refers to the phenomenon when consumers evaluate products more positively when they are associated with art images than when they are related to non-art images (Hagtvedt & Patrick, 2008). In addition, artistic characteristics could contribute to positive consumer evaluation (Crader & Zaichkowsky, 2007). Similarly, art images are more persuasive than non-art because art adds a unique glamour to products (Mantovani & Tazima, 2016). According to Lacey et al.'s (2011) research titled 'Art: For Reward's Sake', artwork activates the brain's reward circuit when viewing an art image. Art infusion studies focused on the effects of consumer perception of art on a product, but consumers' brand experience embedded in an artwork of art has not been completely explored.

Street Art as a Vehicle to Transform Communities

Urban Art and Social Value. In the last decades, urban art has been increasingly used for social transformation. These art interventions in public spaces frequently drive an entire district's social change by adopting interaction and daily habits that improve people's daily lives (Gonzales, 2017).

Howes (2005) demonstrated that interacting with urban art often involves a degree of engagement. This engagement is not only an interaction with an object, space or device but also a degree of emotional involvement as a part of an experience (Laurel, 2013). Consequently, if an urban artist desires to produce and engage people in their work, then they should address people's emotions.

Reconstruction of a city. This reconstruction is commonly achieved by collaborating with the community and their stakeholders (Perez, 2010). Creativity and artistic activities can significantly help resolve this problem, (Lopes, 2017). Baquero (2017) demonstrated the importance of urban art to rebuilding a city's reputation and perception marked by trauma of violence. Throw graffiti, murals and photography urban artist have changed the meaning of violence and fear in the city of Medellin. This cultural art requires gender equality and justice reconciliation with past events, which are fundamental to rebuilding national identity.

Education. Urban art intervention practices use open spaces art-making, learning and social action spots. As mentioned by Desai and Darts (2016), street art is not only made to decorate environment but also to challenge the viewer to reflect how these public spaces are connected to dominant power relations. Accordingly, Miles (2004) suggested that many artists are motivated to make interventions in open areas primarily due to provocation and participation. Hence, their works aim to provoke thought and generate dialogue and discussion among the viewers. Urban artists can be described as educators who teach the public about the connection between public spaces and private interests (Desai & Darts, 2016). Their street art seeks to challenge the cultural status quo. They stimulate a dialogue about this issue, which reflects their daily life. In addition, the relationship between urban art and education is reflected in a phenomenon wherein an art educator moves to public areas for pedagogical intervention. An art educator uses different educational strategies to connect with the public. They aim to challenge different actors and public spaces' private interest in a democratic system through art projects (Duncum, 2011).

Urban Art and Economic Value. Urban art is a precursor of community wealth. Universities, non-profit organizations, governments and business enterprises use urban art as a valuable resource. The creation of alliances increases artist salaries and land value and promotes tourism. Public art can be 'an authentic form of visual communication within the open space of the city and a profitable element of the capitalist system' (Antoniou, 2014).

Alliances and artist salaries. Urban artists travel worldwide to work on international projects. As artists found an increment in their income through this activity, local painters cannot use public art activity as their only source of income. Thus, they engage in other jobs and activities with better remuneration, including worldwide civic events. Festivals have federal funding and capture the attention of sponsors and brands. They promote local artists' exposition and international visitors' recognition. Artists consider these activities as opportunities to travel overseas and gain incredible experiences. These collaboration and alliances promote economic activity as partnership is an integral part of street art activities. Live painting events also showcase numerous artists working as a team and complement their painting. Therefore, artists are compelled to be harmonious during an entire activity, thus enabling them to enrich each other's works.

Land value and tourism. Art and an urban neighbourhood's economic changes are associated. Seresinhe (2016) conducted an experiment in London and found that communities with high proportion of art photographs have high relative gains in property prices. Thus, similar to economic development, the visual environment may significantly affect crucial aspects of people's life (Seresinhe, 2016).

Urban Art and Environmental Value. Environmental issues have been intensively explored since the 1960s. However, certain scholars have argued that the value–action gap between people's attitude and behaviors must be addressed to achieve drastic environmental change (Tunnacliffe, 2013). Urban art plays an essential role in this context by offering an interactive way of reconnecting with our environment, communities and ourselves. The meaning of conservation is a relevant concept that needs exploration. Furthermore, the role of the local community members in urban mural preservation is relevant. Community members can maintain cultural heritage, conservation values and process. However, designing a project to engage community members with clear objectives reflected in their assigned tasks is a challenge (Dickinson, 2010). Kyi, Tse and Khazam (2016) provided evidence that community members highly commit to public visual spaces by establishing a conservation dialogue and providing conservation data on urban murals. They also demonstrated that this commitment should be motivated by information that promotes an evidence-based dialogue of preservation projects, such as cultural heritage and environmental preservation.

In sum, previous research has examined the aesthetic value of urban art and its impacts on consumers and their experiences. Studies show that urban art has an impact on the social, economic and environmental context of a community (Koeck, 2011). Thus far, consumer-perceived value of urban art and brands remain underexplored. Understanding the value of street art advertisement is important to set the bases of understanding its effect as a marketing strategy. Although there have been studies that explored the phenomena of street art and marketing through a systematic research review (Visconti, 2010; Droney, 2010; Borghini, 2010; Saucet, 2015; Molnár, 2018), understanding the specific brand benefits poses an interesting question for scientific research.

Methodology

In-depth interviews were conducted with three segments: Five urban artists, eight brand managers and twenty consumers. The interview guideline was formulated based on personal perception of street art movement in each segment, brand collaborations, and consumer experience. The interviews were conducted at the respondents' studios and offices, during a 6-month period, and instrumentation rigor followed (Chenail, 2015).

In this study reflexivity was used to diminish possible bias by analyzing the interviews. Prolonged engagement also avoid projecting own experiences (Berger, 2015). For analysis, Spiggle's (2015) data were categorized, abstracted, compared and integrated. Meanings were interpreted based on their identifying patterns. Each meeting was audio-recorded and transcribed. The interviews were imported into NUD.IST Vivo software (Welsh, 2002), and then the content was catalogued into the findings.

Findings

Street art advertisement can be a valuable brand experience as it stimulates consumers' affective, intellectual and behavioral responses. Three main emerging themes related to street art advertisement value and brand benefits. First, social connectedness as street art creates bonds by merging community identity. Second, it imprints and image in memory and provokes thinking and imagination. Third, beautification of spaces engages consumers, hence provoking dissemination. Although all segments share the same three themes, they have differences. Urban artists tend to focus on the affective response, recalling social connectedness, whereas brand managers focus on functional variables, such as visual memory and brand benefits. The consumer segments emphasize the most the value of creating bonds and beautification of spaces as they mentioned brand benefit awareness. We shall now analyze each emerging theme by segment response.

1. Social Connectedness: Bonding with the Community Identity

All participants agree that street art stimulates mainly customers' visual sensory. An arousal provokes involvement that creates bonds and social connection. After provoking sensory, street art can stimulate feelings, sentiments and emotions. These feelings can be translated into more elaborate constructs, such as love, hope and happiness that are interconnected.

'As soon as we started to shake the paint cans; the children of the community listen and come to join us' (Urban Artist Silvestre).

'It is an experience of encounter and connection between people from the urban art that emphatically impacts the space, to activate the transformation' (Brand Manager Tomas).

'I think it gives a positive feeling to the environment that motivates people and connects the humans through a different type of communication which is urban art. If the world that surrounds us is colorful and if this art has a positive meaning it will give a positive impact on people's mind' (consumer).

The segments mainly differ in that urban artists and consumers reflect more comments on the sensorial and affective aspects, whereas brand managers find more functional value on final consumers that are preoccupied of visual and symbolic content. We observed urban art can also generate negative emotions, such as dislike or rejection, depending on the type of image or message. Therefore, care is necessary for visual content to promote the creation of bonds.

Urban artists elaborate multiple constructs derived from primary sensorial stimuli. They tend to focus on affective constructs, such as humor, love and joy that are evoked by the urban art. This approach provokes people's participation and engagement, creating bonds beyond the conventional family. The reason is because people from streets have different cultures. This technique promotes social connectedness beyond common social approaches.

'Urban art helps to fall in love, it revives the community humor' (Urban Artist Silvestre).

Brand managers recognize emotions and affective street art value. They recognize that these emotions by consumers impact their connection. They mainly focus on utility aspects, such as serving as a communication channel, community transformation, encounters and connections and brand benefits, such as social responsibility, partnerships, respect and recognition.

'The joy of seeing a city with art and people enjoying it without having to pay for a museum is also a great joy' (Brand Manager Elizondo).

'Urban art has brought greater recognition to my brand, thanks from people; and above all, I think it has given us a lot of social joy in the company to know that we are impacting, that we are helping Mexico' (Brand Manager Elizondo).

Final consumers focus the sensorial and positive sentiments and how they create unity and bonds as they recognize it as a cool strategy. This segment shows peculiar interest in visual content and present dislikes in few cases only.

'It is a way to connect and bond without the need to exchange words' (consumer).

'Connect a community of people, get them closer' (consumer).

In sum, we observed that street art stimulates the interviewed segments' sensory and affective aspects. These aspects elaborate consumers' positive constructs and positive brand benefits as connections and social recognition. Consumers may not appreciate, understand or value urban art in a personal perspective. Nevertheless, given that street art is in public areas, it can give opportunity to respect differences. Thus, a bond beyond personal thoughts is created in a bigger picture by sharing handmade visuals in a physical public space.

2. Imprinting an Image in the Memory: Authenticity and Coolness

All participants agree that street art generates intellectual values, such as thinking, curiosity, interpretation and can enhance imagination. It can be associated with a learning device as customers are involved in an intellectual process that impacts their memory and could be associated with brand recall.

'The brand makes the relationship for them to associate, what they do is ask you a certain range of colors, as for example tequila the miracle' (Urban Artist Beo Hake).

'And the works of art provoke an interpretation. So that it provokes an interpretation and as it is something of daily use, gives character, and what I mean is that its symbolic character is built with use, with socialization, with language. An object, any object, acquires meaning depending on how we use it' (Brand Manager Coker).

I like that the brand uses urban art as a means of advertising, it is a way of letting the city express itself as a living entity through its artists. Traditional advertising is made for consumption, urban art for the contemplation of space (consumer).

The segments mainly differ in that only the consumer segment shows peculiar interest in visual image content. Moreover, urban artists and consumers show more interest on the public educational arena, whereas brand managers focus on building brand identity.

The urban artist and consumer segments held that this strategy can be associated with a young and coolness trend and can be an alternative advertising method. The consumer segment identifies visual content as a learning device that generates intellectual involvement and promotes their understanding and respect of other ideologies.

'I think they associate it with youth, give it a fresher air but also differentiate it from traditional marketing' (Urban Artist Asero).

Brand managers find value in the marketing discourse of urban art benefits and linkage with a symbolic value and brand identity and recognition.

'In the area of the creation of identity there are many possibilities, and it is very exciting' (Brand Manager Coker).

Consumers recognize that brand identity could be a learning device that transforms consumer judgements. Only the consumer segment shows value on considering content; they promote health and do not prefer the use of underage content.

'People learned new things through paintings like culture, it can inspire young people and for the same thing that its impressive people always put attention to it' (consumer).

'It creates a piece in the way that people become more understanding and open-minded' (consumer).

'The themes should be for every kind of public, nothing suggestive, always with respect' (consumer).

'Do not use text so people can interpret whatever they want' (consumer).

'The brands should send a message of cleanness, care of the environment, respect consciousness, about the importance of don't get lost in technology or dehumanizing, messages that promote communication, anything related to the health' (consumer).

In sum, we observed that this strategy imprints visual memory and could be a helpful learning and association device that build on brand image with a unique, social and cool trend.

3. Permeating an Aura of Beauty: Engaging and Social Dissemination

All participants agreed that street art can provoke community engagement and contributes to public space beautification. The segments mainly differ in that brand managers focus more on utilitar-ian brand benefits, whereas urban artists and consumers focus on community values. In sum, physical actions and bodily experiences are identified as action-oriented. Street art motivates consumers to engage in the experience, reunite and make sense of community and take pictures and videos and share them on social networks. Thus, consumers become a publicity agent of urban art. Overall, they all share their passion to utilize urban art as a win-win strategy.

We influence in the humor, urban art makes the neighborhood to reunite, to be more united, and create community, we all together build a better park for our children, and they can see, so we teach them with the example' (Urban Artist Asero).

The art interventions, why are you doing are adding to those networks and becoming nodes of interaction for the different people who inhabit the same space, and that happens because where before there were people who had nothing in common, now you have an art intervention that everyone sees every day and that generates topics of conversation, and they make you part of a community' (Brand Manager Coker).

It think that kind of art provides a great atmosphere for the city and thus more people will come to visit the city (consumer).

The main difference between the interviewed segments is that urban artists focus on the sensorial and affective values, whereas brand managers focus on functional responses as network transformation and dissemination of artwork. Final consumers share the same sensorial and functional values. Only the consumer segment had few unpleasant responses. They presented dislikes regarding possible visual contamination. Thus, they were emphatic on managing the content.

Urban artists appreciate physical community involvement, hence disseminating their work via word-of-mouth and social networks. All brand managers and urban artists showed passion and enjoyment of their job.

'A friend of mine did a job for Honda in Mexico City, he painted a car with enormous profound columns, as if the car was up in the columns, so the persons started to jump between the columns, the art promotes the people interaction, and as the persons are part of the picture, promotes a virality in social networks' (Urban Artist Dazer).

'We were three weeks in Dubai at the Festival Dubai Canvas, they invite us the five-star hotel and pay for everything, they even gave us special equipment; all the time there were this status cars like Rolls Royce and Lamborghinis. We paint two giraffes at the beginning, we have such a success that then real motley of giraffes was custom made identical as the ones that we paint and were walking over the festival, the Jecke came to take a picture, and we were on the news, the paint became viral as every consumer what to take a photo and put in into Instagram' (Urban Artist Dazer).

'Brands are utilizing street art because there is a projection, there is an audience, urban artists have an audience, thanks to social networks, I have friends colleagues who have thousands of followers in their networks' (Urban Artist Acaro).

'The bank Santander asked marketing agencies to search for several urban artists to paint street bank cashiers. The campaign was displayed all over the country, but the exciting thing is that they took pictures and make a video of that, and they put it out into Instagram' (Urban Artist Beo Hake).

Brand managers focus on functional responses, such as dialogue, network creation, connection building, territory transformation and brand dissemination. They also recognize economic benefits for the enterprise.

What we do is we mobilize the transforming energy from the places where we are working' (Brand Manager Perez).

'It is important for territorial development. And that same brand city gives rise to the development of certain organizations. Because the brand makes that space attractive. It attracts talent and that attraction of talent makes networking happen, networks are being woven and this, in turn, builds the brand, and the brand attracts more people, and these people are joining the networks and this is where they are transforming and creating the new organizations. To organize oneself you need closeness, that people inhabit these spaces' (Brand Manager Coker).

'With the urban art festivals is that there are programs of activities in public spaces, this is where the fortuitous encounters are generated and coexistence is generated, which together generate the construction of citizenship, community' (Brand Manager Padilla).

And well, in economic matters, we have seen an increase in sales of paint counter (Brand Manager Elizondo).

'These types of projects are very attractive for anyone, to be able to position oneself in the media' (Brand Manager Nuñez).

Consumers found an opportunity to transform physical spaces into a more aesthetic, inviting and functional ones. They believe this transformation could improve an environment's attractiveness for tourism.

It generates value because messages can be spread around through art (consumer).

I like the urban art publicity that also has a functionality, and serves as the –Sprite Showers-, that are on the beach' (consumer).

In sum, this research provides insights about how street art contributes to the communication of a specific brand, as compared to classical media. As it appears to stimulate the sensory, intellectual and behavioral responses of the consumer by creating bonds with the community identity; provoking thinking and interpretation; permeating an aura of beauty and social responsibility and by letting the brand benefit from its viral dissemination over social media (see Table 1)

Conclusion

Urban street art in the social, educational and economic arena has been explored. However, in the context of marketing management, specific benefits for urban artist, brand managers and consumers was unexplored. Thus, this study aimed to extend this knowledge and how it benefits consumers and brands. We found that urban art can be a valuable brand experience as it stimulates consumers' sensory, intellectual and behavioral responses. Our research highlights that it can promote social connectedness, hence creating bonds by merging communities, imprinting visual memory, giving an image of coolness to the brand and engaging the community in public space beautification. These activities promote brand dissemination via social networks.

Previews research in the field of outdoor advertisement has stated that in regards to communication of a specific brand, several variables as creativity, attention, and memory have been studied and shown benefits related to product involvement, brand attitude, and advertising recognition (Rosbergen,1997, Wilson,2015). We contribute to this research by highlighting that street art contributes to the communication of a specific brand not only by involvement and recognition, but by enhancing the brand experience through community bonding, the creation of an image of authenticity and coolness and by social dissemination of the brand.

Our results have important managerial implications as we found that establishing a link between urban artists and brand managers could be crucial to setting the bases of a successful project. The integration of the community into an artwork's design can be a significant factor that impacts consumer satisfaction. Consumers ask for positive messages of humanization and health to visual image and avoid violent, negative and underage content. Urban art should improve a city's appearance, and not tarnish it. Consumers mention to prefer urban art that provides a clean surrounding and does not promote visual contamination. Consumers aim for brands that respect artists' freedom to maintain the pureness of art. Urban art advertisement should be developed based on important factors that control art elements that may irritate consumers and negatively impact their experience. This aspect could be seen as the primary responsibility of brands.

Urban street art advertisements attract consumers. Communities, enterprises and government can positively involve in creative ways. We found that customers are eager to witness these interventions. Future research could explore the type of brands and products on which this strategy effectively works and the specific characteristics of image type. Online advertising through social networks is a major unexplored area (Hadija, 2012). Thus, an analysis of the impact of these images on a social network could be also an area of future research. Urban street can also be used as a valuable resource for segmentation and targeting decisions, when analyzing community brand responses. Urban art can identify various consumer trends, including their likes and dislike. Visual image can be useful for future product development and advertising campaigns that involve the community.

Implications of Underrepresentation for Female Fashion Consumers

Lena Cavusoglu, University of North Carolina at Pembroke, USA
Deniz Atik, University of Texas Rio Grande Valley, USA

EXTENDED ABSTRACT

Ideal female beauty standards are set by global fashion and beauty media and featured as including a narrow face with high eyebrows, large, round, light-colored eyes, high cheekbones, thin noses and lips, and straight hair (Kim 2010) and are associated with Whiteness (Taylor 1999) and thinness (Mussell, Binford, and Fulkerson 2000). The constructed, so-called Western standards of beauty and femininity (Bartky 1997) have "*racialized* beauty, [in] that it has defined beauty per se in terms of White beauty, in terms of the physical features that the people we consider white [people] are more likely to have" (Taylor 1999, p. 17). Therefore, in a fashion scene dominated by Caucasian and Western looks, the idea of ideal beauty became even more substantial for minority women from different ethnic, racial, religious, or cultural backgrounds and women in different age groups, socioeconomic classes, and physical abilities, to name a few. As such, investigating the fashion consumption experiences of a divergent group of women and the way they read the physiological, social and psychological consequences of underrepresentation in the fashion industry becomes crucial for both consumer researchers and industry professionals.

Before beauty firms began exporting, each society had a unique perception of beauty, obtained through the years from the traditional views and the physiological characteristics of the people (Yan and Bissell 2014). Beauty and aesthetic perceptions of societies varied considerably over time and between geographies, and thus how cultures enhanced their attractiveness through cosmetics, hairstyles, and clothing was unique. No global perception of what was beautiful existed. For instance, the Korean feminine beauty was to possess an average or even overweight body in size as a symbol of abundance and wealth (Han 2003), while oversized and curvy Hispanic women were valued as fertile and attractive (Cunningham et al. 1995). However, globalization gave rise to the Westernization of beauty by diffusing the Western hygiene practices and beauty ideals. In other words, beauty firms converted societal values into brands, commoditized beauty, and, ultimately, exported those commodities to many other countries, carrying strong assumptions of what is beautiful. The commoditization and marketization of beauty eventually changed societal perceptions of beauty worldwide (Jones 2011).

As Western beauty ideals became globalized, local beauty ideals and practices were abandoned. So, due to their influential, global reach, beauty firms, fashion magazines, and Hollywood remained the trendsetters in fashion and beauty. The concept of "world fashion," which is embedded in Western culture and history, began the global diffusion of ideal beauty standards and the appropriation of Western clothing.

The westernization of fashion and beauty eroded the national beauty standards for women other than Caucasian (Isa and Kramer 2003) and the traditional way of dressing in non-western countries. The overwhelming lack of representation of women who do not possess the qualities that are reflected in the standard definitions and rules of the fashion and beauty industry causes a significant disparity and brings forth huge struggles for minorities.

Since research on issues such as race, ethnicity, gender, physic, and appearance are defined as socially sensitive topics (Renzetti and Lee 1993), qualitative methods, to explore the experiences and subterranean feelings of individuals, were suitable (Liamputtong 2007). A total of 38 semi-structured, open-ended, in-depth interviews were conducted with women from diverse racial and ethnical backgrounds from various cultural environments with different body shapes and sizes to obtain rich insight and thorough understanding of the present phenomenon (Cherrier and Murray 2007).

The findings of this study demonstrate three prominent themes regarding how a diverse group of women read the physiological, societal and psychological consequences of underrepresentation in the fashion industry, based on their everyday fashion experiences. The three implications that are discussed are 1) the fear of social exclusion, 2) body dissatisfaction, body shaming, and self-hatred, and 3) sexism and exoticism from racism.

First, many women who do not have the privilege of getting reaffirmation for their facial and physical features from the fashion media feel that their look is not a kind of beauty that is worth celebrating. The assumption of being perceived as ugly and different leads to the fear of social and romantic discrimination, the lack of access to economic and social power, and, overall, the dismay of social exclusion. The marginalization of women who do not fit into the socially constructed stereotypical images of beauty and fashion damages the self-conception by lowering self-esteem and increasing the feelings of body shame, anxiety, and depression and the fear of social exclusion.

Second, due to the fear of social exclusion, all women, regardless of their race and skin color, strive to change their physical appearances, become estranged from their bodies, and naturalize body shame and self-hatred. The consequences of insecurity and body dysmorphic disorders are devastating for women of minority groups, who are left to feel physically deformed, inadequate, and abnormal.

Third, in the context of fashion, exoticism displays non-White women as objects to be admired, and their racial identities "[become] something to work with, an aesthetic, a quality to be powered up or down," (Wissinger 2015, p. 241). Therefore, the racial identities of non-White models become subjects of Western cultural appropriation, and their races are treated as styling choices, rather than social identities.

Results of this study discuss the physical, social and psychological implications associated with the industry's assumption that fashion becomes aspirational and admirable because it is ultimately unattainable. By showing why representation in every form of beauty is so essential for women's physical, social and emotional well-being, this study acts as a powerful reminder for fashion professionals to promote diversity and for academia to conduct scholarly work on the subject.

Giving, Selling or Throwing Away Unused Objects: A Complex Decision

Eva Cerio, IRG, University of Gustave Eiffel, France

EXTENDED ABSTRACT

People have several choices for disposing of their unwanted object: throwing away, giving to charities, selling online or in flea markets. Why are some objects thrown away while others are eligible to reselling? This research exposes explanations of why people choose one of these options, and how they build their disposal practices. Disposition is viewed as all actions taken by an owner towards an unused item (Jacoby, Berning, and Dietvorst 1977) but I focus on practices involving the loss of a physical property - the object is no longer possessed by its owner.

Priori research in disposition identifies motivations of redistributing items instead of throwing them away (Bergadaà, 2006, De Ferran et al., 2020, Guillard and Del Bucchia, 2012; Lemaitre and De Barnier, 2015). Consumers want to reduce waste and preserve the environment – and for some of them, oppose the throwaway society (Ertz et al. 2017, Roux and Guiot 2011). They also reuse their items for saving money, meeting financial needs, or having fun and playing shopkeeper (Juge, Collin-Lachaud, and Roux 2019). Finally, redistributing objects favor social links. Other literature has shed light on several factors influencing disposal practices, such as product-related factors, individual factors, situational factors, and practices-related factors (Albinsson and Perera, 2009, Roster 2001, Paden and Stell 2005, Trudel et al., 2016) but without totally explaining how. This present research focuses on how people decide between disposal practices (online selling, online giving, flea markets, charities' donations, and garbage) and what are their meanings.

To do so, I conducted a 6-months ethnography with diversifying profile, data and collecting tools. The study occurred in Paris, France, from July to December 2019 and followed three steps: three introspective stories, thirteen in depth interviews and four participant-observations. The 2-pages introspective stories were about reselling a phone online, sorting clothing and donating them to a charity. This helped us prepare interviews. Then, a first sample of 13 consumers was interviewed. Nine interviews occurred at participants' home and four over the phone. They lasted 65 minutes on average and were about current objects they want to dispose of: what will they do about it, how and why. We started again with every object they want to cede. Interviews were completed with four participant-observations of sorting with intention to redistribute items: one sorting of clothing by a mom, one sorting of male clothing, one preparation for a move and one deceased person's possessions disposal. Those observations helped to understand choices between disposal practices and decisions regarding specific object. Each observation happened at participants' home and included the author's participation. Using a protocol analysis (Payne, 1976), participants called out any decisions, ideas and thoughts about what they would do with an object. Observations were recorded in notes, instant photos, and audio recording. We took 45 pictures and had seven hours and half of audio recording. I hold a logbook to note field reports and any feelings or theoretical ideas. All the data from interviews, introspective stories and observations were analyzed through a manual thematic analysis (Braun & Clarke, 2006). Several themes emerged for each disposal practices identified; we compared them to identify differences and commonalities.

The findings show that informants dispose of an object when they are not attached to it, do not used it anymore, consider that it takes up too much space or keep it stored for too long. Some consumers need to distance their objects spatially and temporally by stocking them in "cold" places for some time like basements, attics, or closets before to dispose them. This helps them forget about their link with their objects and be ready for disposition. When they agree to cede the object, this latter does not exist anymore for its owner. All participants agree to say that the more an object is affective, the more difficult it is to cede it. That is why they more dispose of everyday objects like clothing, toys or furniture than special ones like gifts, jewelry or family's possessions. We notice a growing interest for online reselling and donation: considered as easy, useful and planet friendly. Participants do not use only one disposal practice but sell, give to charities, or attend a flea market, several times a year. The choice of the most appropriate practice is driven by three dimensions, which are interrelated: (1) a product-related dimension, (2) skills and habits, (3) meanings according to the practice. These dimensions are linked together and the interactions between them influence the decision-making process. For comprehension matter, I will introduce the three dimensions separately.

First, disposal practices are different according to the physical characteristics of the object: the heavier or the more cumbersome or in high volume the object is, the more consumers will try to cede them easily and will give it, thrown away it or attend a flea market. For example, clothing, books, or toys are more often given to charity and relatives than sold. But when the object has emotional value or high market value, consumers will sell it online. Nowadays, consumers use C2C platforms for every type of objects which has a minimum market value, they will try to sell it. They will give objects they failed to sell online or on flea markets. We notice that donation increasingly becomes a fallback solution than the first one. Some intimate-related objects, such as underwear, mattress, or household linen, are more thrown away because of the object's perceived contamination. Besides, participants reuse objects with utilitarian or market value when they throw away worn down or old-fashioned objects.

I also notice that skills and habits matter in the disposition choice. Some people prefer to throw away or give to relatives and charities because they do not feel skilled enough to sell or to give online. It takes efforts to write classified ads and time to be available for answering and meeting. Flea markets require to store all the objects, to get up early, to fill the boxes or to think of all prices. Consumers perceive it as binding. To sell, people need to assess the potential price of the product and to have business skills for negotiating. In line with Denegri-Knott et al. (2009) selling requests a significant investment for maximizing the economic value. As several consumers think they do not have it, they rather give. Giving is based on habits; most of participants are used to give to charities because they saw their parents do it and perpetuate family pattern. Giving to relatives is a rooted behavior because their family does it as well.

Finally, the decision is related to the meanings of the disposal practice. Redistribution practices are considered as means to valuing and passing objects, to reducing environmental impacts and teaching kids the good manners. In this case, consumers prefer giving and selling than throwing away. However, they favor different practice according to what they want. They choose flea markets when they seek a friendly and sharing moment. They give to help citizens and promote social meetings while quickly disposing of bulky objects. Sometimes, not knowing the potential recipient of their object can be hard. Therefore, they favor online giving or relatives 'donation to have a look on the future of the object. For those who prefer to earn money or play shopkeeper, they focus on online selling.

This research makes several theoretical and managerial contributions. If past literature studied factors that influence redistribution instead of garbage (Albinsson and Perera, 2009 ; Paden and Stell, 2005), this research shows that the disposal decision is not only between throwing away or redistributing but also between the type of redistribution practices. I confirm products-related factor such as utilitarian, emotional, and/or financial value (Roster, 2001) but I also show that skills (efforts that need to be made), habits, and meanings need to be considered. This research reveals the complexity of the decision because consumers must deal with different factors to make their choice. Besides, I note an increasing progression of redistribution practice, which is a positive trend for environment. This research gives charities or C2C platforms some foods for thought to better develop their activities. For instance, people might be afraid of what their objects will become by giving them to charities. These later should favor communicate about how the objects will be used in the future. It could also help consumers to detach from their objects. Then, C2C platforms should facilitate the website's use and reassure people about how easy it is to sell or give online – by developing aps for example or guidelines about how to price their products.

Embarrassed by Calories: Joint Effect of Calorie Posting and Social Context

Melis Ceylan, Bilkent University, Turkey
Nilufer Z. Aydinoglu, Koc University, Turkey
Vicki G. Morwitz, Columbia University, USA

EXTENDED ABSTRACT

The mandatory posting of calories has been implemented since 2008 to lead consumers to make lower-calorie meal choices (Bollinger, Leslie, and Sorensen 2011). Prior research has shown that the results in regards to the effectiveness of the law are mixed (Krieger and Saelens 2013). For instance, Bollinger and colleagues (2011) showed that after the implementation of a calorie posting law, the average calories per transaction at New York City Starbucks fell by 6%. Contrarily, Elbel and colleagues (2009) did not detect a significant reduction in the total calorie of food purchases in New York City after the labeling mandate had been enacted.

Calorie information is difficult to evaluate (Chandon and Wansink 2007). The ease of use and diagnosticity of a piece of information like dish specific calorie information depends on how knowledgeable an individual is about the value of that attribute (Hsee 1996). Consumers who have a high concern for healthy eating are probably already well-informed about calories. Others may not be motivated to calculate their calorie intake accurately for everyday food consumption. Motivated by this, we argue that calorie posting may not be enough to encourage consumers to make lower-calorie choices unless they order food in the presence of others as social desirability concerns increase in public (White and Dahl 2006). In this research, thus, we examine the joint role of calorie posting and social context to explain these mixed results.

The presence of others at the point of food purchase influences food choice (Herman, Roth and Polivy 2003). For instance, impression management studies show that when individuals have a desire to convey a good self-image, both men and women decrease their food intake. Excessive eaters are usually perceived as heavy and unattractive individuals who do not have any self-control (Vartanian et al. 2007). Thus, eating less help individuals convey a desired self-image (Pliner and Chaiken 1990). Furthermore, Goldfarb and colleagues (2013) found that orders made in a restaurant have fewer calories than orders made through the restaurant's website. Their findings suggest that individuals try to refrain from others' social judgment of their food ordering since orders with high calories can result in negative judgments from others. Ordering food in private lowers the concern of being judged negatively due to a person's food choice and increases consumers' tendency to order high calorie food. Therefore, we formally make the following hypothesis:

Hypothesis 1: *The decrease in the total calorie of consumers' menu selection when calorie information is presented (vs. not) will be larger when the food is ordered in a more social context compared to when it is ordered in more private context.*

Violating social norms on food choice might elicit a potentially uncomfortable social situation as it might generate negative evaluations from others (Herman et al. 2003). The notion that individuals try to avoid those socially uncomfortable situations relies on Goffman's research on embarrassment. According to Goffman (1956), individuals feel embarrassed when the act of presenting a good self-image to others is disrupted. Thus, we predict that ordering excessive calories would increase the feeling of embarrassment when consumers are observed at the point of food purchase. This feeling should be heightened when calorie information is available at the point of

purchase. In order to manage their impressions and avoid the feeling, we posit that they would lower the total calorie of their meal orders. In others words, anticipated feelings of embarrassment due to getting negative evaluations regarding meal choice would enhance the strength of calorie posting in leading consumers to make lower-calorie meal choices in social food ordering context. Therefore, we formally make the following hypotheses:

Hypothesis 2: *The increase in feelings of embarrassment when calorie information is presented (vs. not) will be larger when the food is ordered in a more social context compared to when it is ordered in a more private context.*

Hypothesis 3: *Anticipated embarrassment due to ordering high calorie meal in the more social context will mediate the effect of calorie posting on meal choice.*

Overview Of Studies

We next report the results of four studies with MTurk participants and one restaurant field experiment with actual food choice data. All MTurk studies employ a scenario-based food ordering situation in which we manipulated the menu type as calorie-posted or regular menu and social context as more social or more private. Manipulation checks regarding how private the food ordering context was perceived by participants show that social context manipulation works as intended. Studies 1, 2, and 5 test H1. In these studies, we take the log of the total calorie of meal orders as the dependent variable, as it is not distributed normally; we represent the untransformed (i.e. raw) mean values for ease of interpretation. Study 3 tests H2 and Study 4 tests H3. According to H2 and H3, people will make lower-calorie meal choices from a calorie-posted menu in more social context; and ordering a lower-calorie meal will help them avoid potential embarrassment. This path creates a methodological challenge to show a full-model mediation on total order calories through anticipated embarrassment for two reasons. First, when embarrassment is measured after meal choice, making a lower-calorie meal choice removes or substantially decreases feelings of embarrassment. Second, measuring anticipated embarrassment before meal choice might increase the mediating effect of embarrassment. Thus, neither is a viable option. As a solution, instead of measuring anticipated embarrassment in Studies 1 and 2, we hold total order calories constant across conditions in Study 3 and measure felt embarrassment as an indirect demonstration of the role of anticipated embarrassment in meal choice.

We control for gender, BMI, age, and hunger level in Studies 1-4 as these factors might affect meal choice (Parker and Lehman 2014). Study 3 also controls for impression management concerns as a trait variable (Scheier and Carver 1985) as it measures participants' embarrassment due to ordering excessive calories. Importantly, neither gender nor impression management concerns interacted with calorie posting and social influence in any of the studies.

Study 1

All participants (N=82; 40% women, M_{age}=35) were asked to imagine that they were college students. Participants in more private

(social) context condition ordered food from an online tapas menu when they were alone (together with their recently met roommate) in their dorm room.

The analysis revealed a significant effect of calorie information ($F(1,70)=8.66$, $p<.01$). Calorie posting significantly reduced the total calorie of meal orders ($M_{calorie\_present}=1149.86$; $M_{calorie\_absent}=1608.88$). As expected, the two-way interaction between calorie information and social context was significant ($F(1,70)=3.98$, $p<.05$). In the more social context condition, total meal calories were significantly lower with calorie posting ($M_{calorie\_present}=944.23$; $M_{calorie\_absent}=1709.05$; $F(1,70)=13.57$, $p<.001$). However, in the more private context condition, total calories did not significantly differ between the two menu conditions ($p>.5$).

Study 2

Participants (N=176; 62% women; $M_{age}=39$) imagined that they were a management consultant and they had a meeting with an existing client. We indicated that it was an existing client to rule out the alternative explanation that the first study's results were derived from first impression concerns as participants were instructed to assume that they ordered food with a recently met friend. In this study, participants in the more social (private) context condition imagined that after the meeting it was dinner time and they decided to have dinner together with the client (alone). The analysis revealed a significant effect of calorie information on total calories ordered ($M_{calorie\_present}=2025.33$; $M_{calorie\_absent}=2425.24$; $F(1,165)=9.03$, $p<.01$). Age also had a marginally significant effect on calories ordered ($F(1,165)=2.9$, $p=.09$). As expected, the two-way interaction between calorie information and social context was significant ($F(1,165)=5.80$, $p<.05$). When participants were in the more social context conditions, disclosing calorie information significantly lead participants to make lower-calorie meal choices ($M_{calorie\_present}=1882.50$; $M_{calorie\_absent}=2588.72$; $F(1,165)=13.82$, $p<.001$). However, when participants were in the more private context condition, total calories did not significantly differ between the two menu conditions ($p>.6$).

Study 3

This study (N=128; 37.5% women, $M_{age}=36$) employed a similar scenario used in Study 2. First, all participants read that they were ordering a chicken and biscuits plate and a red velvet cake in the described food ordering scenario. Participants in the calorie-posted condition were informed that the main dish plate had 1800 calories and the dessert had 450 calories. Then, participants indicated their feeling of embarrassment (embarrassed, uncomfortable, and awkward; $\alpha=.97$, Dahl, Manchanda, and Argo 2001) about this experience. This study also controlled for how much participants liked chicken and cake because these might also affect their feelings.

The analysis revealed significant main effects of calorie information ($M_{calorie\_present}=3.87$; $M_{calorie\_absent}=3.04$; $F(1,114)=14.52$, $p<.001$) and social context ($M_{more\_social}=3.86$; $M_{less\_social}=3.12$; $F(1,114)=7.23$, $p<.01$) on embarrassment. Additionally, there were significant effects of liking for chicken ($F(1,114)=5.53$, $p<.05$), liking for red velvet cake ($F(1,114)=4.54$, $p<.05$) and the concern for impression management ($F(1,114)=70.35$, $p<.001$). More importantly, results revealed a marginally significant two-way interaction between calorie information and social context ($F(1,114)=2.85$, $p<.1$). When the context was more social, calorie posting significantly increased participants embarrassment due to ordering a high-calorie meal ($M_{calorie\_present}=4.37$; $M_{calorie\_absent}=3.33$; $F(1,114)=15.44$, $p<.001$). However, when the context was more private, participants' embarrassment did not differ with whether or not calorie counts were posted ($p>.1$).

Study 4

In this study, a one-way (eating alone vs. eating with a client vs. eating with a client w/o having impression management concerns) between-subjects design (N=133; 40% women, $M_{age}=36$) was used. First, participants assumed that they were having a meeting with an existing client. In the first (second and third) condition(s), participants were asked to imagine that after the meeting, they decided to have dinner alone (with their client). Also, participants in the client w/o impression concerns were asked to assume that they have been working with this client for a long time so while hanging out with this person they **do not have to worry about their public image,** they can do whatever they want and they **have no reason to be embarrassed about anything they do.** In the second part of the scenario, participants were asked to indicate how much they like to order a Fettuccini Alfredo chicken platter that contained 2230 calories.

Participants in the client condition indicated a significantly smaller willingness to order the plate than participants in the alone and client with concerns removed conditions ($M_{client}=3.48$; $M_{alone}=4.45$, $F(1,123)=7.77$, $p<.01$; $M_{client\_concerns\_removed}=4.40$; $F(1,123)=6.01$, $p<.05$). Participants in the alone and concerns removed conditions indicated similar willingness toward the platter ($p>.8$). There was also significant effects of liking of Chicken Fettuccine Alfredo ($F(1,123)=43.01$, $p<.0001$). The effects of BMI ($F(1,123)=3.19$, $p<.08$) and hunger level ($F(1,123)=2.87$, $p<.1$) were marginally significant.

Study 5

We collected data (N=546; 56% women, $M_{estimated\_age}=32$) in a time-span of two weeks at a restaurant that sells various kinds of grilled cheese sandwiches and beverages. We used the existing menu of the restaurant for the calorie-absent information condition. For the calorie-present condition, we created new menus that were printed by the typographer the restaurant currently works with. Both menus included the same food items and beverages and used exactly the same layout. The only difference was that the new menus also displayed actual calorie information for each of the items.

In the first (second) week of data collection, we used the original restaurant menus (new menus that displayed the calorie information). Two research assistants (blind to our hypotheses) observed customers' actual food choices in the restaurant. They recorded each customer's individual food order and whether they ate alone or in a group together with their gender, estimated age, estimated body type, date, start time and duration of the meal. We later calculated actual total calories of each customer's food choice based on their recorded orders, to serve as our dependent variable.

Results revealed a significant effect of gender ($M_{women}=668.56$; $M_{men}=788.74$; $F(1,532)=10.91$, $p=.001$). The duration of the meal ($F(1,532)=7.69$, $p<.01$) and age ($F(1,532)=7.90$, $p<.01$) had significant effects. More importantly, there was a significant interaction between menu type and social context ($F(1,532)=6.68$, $p=.01$). When customers ordered food alone, there was no significant difference in total meal calories whether or not calories were posted ($p>.1$). In contrast, when participants ordered food with others, total meal calories were significantly lower when calories were posted than when they were not ($M_{calorie\_absent}=762.23$, $M_{calorie\_present}=684.00$, $F(1,532)=11.03$, $p=.001$).

General Discussion

In this paper, we examined the joint effect of calorie posting and social context on consumers' food choices and feeling of embarrassment about ordering excessive calories. To the best of our best knowledge, there is no research in the literature that has investigated

this interactive effect to understand the effectiveness of calorie posting laws.

Studies 1, 2, and 5 demonstrated that calorie posting is effective in lowering the total calorie of meal choices only when the context is social. Study 3 showed that calorie posting leads to significantly higher embarrassment in the case of ordering excessive calories only when the context is more social. Study 4 found that when the fear of being embarrassed is removed from a social food ordering context, consumers' willingness to order a high-calorie meal in the presence of others becomes as high as their willingness to order the same meal in the absence of others. These results demonstrate that the social nature of a food ordering occasion increases the effectiveness of calorie posting. Calorie posting further highlights the inappropriateness of a meal choice and causes embarrassment if excessive calories are ordered in the presence of others. Therefore, this research contributes to the food choice research by showing under what conditions consumers become more motivated to process and integrate calorie information presented on menus into their food choice process.

Additionally, the results indicate that impression management concerns have a substantial role in enhancing the effectiveness of calorie posting on food choice. Thus, this research contributes to the embarrassment research. Embarrassment has mainly been studied as an emotion that occurs after more severe social norm transgressions such as making a body sound in public. However, we show that a relatively subtle transgression like ordering a high-calorie meal might increase the same feeling and affect subsequent behavior. Thus, a negative and aversive self-conscious emotion like consumer embarrassment can enhance self-control and increase well-being by encouraging consumers to make more informed food choices.

Motivated by our findings, we recommend policy makers to think about enhancing social aspects of a private dining experience to increase the effectiveness of calorie posting. People share hundreds of millions of photos every year on Instagram with using hashtag 'food' (Batat et al. 2019). Aesthetically served food increases consumers' pleasure and encourages them to share a moment from their dining experience with their followers on social media (Batat et al. 2019). We posit that aesthetically pleasing presentations of lower-calorie meal together with attractive hashtags designed for each lower-calorie food item on a menu can increase consumers' pleasure and lead them to share the picture of their meal on their social media. This can turn a private dining experience into a social experience by encouraging consumers to share pictures of their lower-calorie meals on their social media accounts.

The Disposal Consideration Effect: How Thoughts of Disposal Influence Product Acquisition

Sylvia S. Chang, University of Washington, USA
Nidhi Agrawal, University of Washington, USA

EXTENDED ABSTRACT

Consumer behavior is defined as "acquisition, consumption, and disposition of goods, services, time, and ideas by decision-making units" (Jacoby, Berning, and Dietvorst 1977, 22), and as such, disposal constitutes a key aspect of consumption. Current research extends the understanding of disposal considerations on consumer decision-making by examining how disposal considerations influence product acquisition decisions. While past research on disposal has primarily sought to understand the role of product features on consumers' product disposal decisions (Trudel and Argo 2013; Trudel, Argo, and Meng 2016; Winterich, Reczek, Irwin 2017), our research illuminates the psychology of disposal by examining how the consideration of disposing a product influences consumers' willingness to acquire the product.

We argue that when people think about disposing a product, they will experience a sense of loss as they imagine throwing away the product. Building on mere ownership effect and endowment effect literature (Brasel and Gips 2014; Chatterjee, Irmak, and Rose 2013; Shu and Peck 2011), we propose that consumers who consider the process of disposing a product presumably see it from the perspective of owning it. Hence, the consideration of disposal will result in feelings of loss. This sense of loss then tells consumers that the product under consideration is one that is linked to their sense of self. Indeed, past research suggests that people extend their self-concepts to include their valued possessions and close others, and losing a valued product is equivalent to losing a part of oneself (Ahuvia 2005; Aron, Aron, and Smollan 1992; Belk 1988). Accordingly, we predict that the sense of loss experienced in imagining disposing the product will lead consumers to infer a link between the self and the product. Putting these insights together, we propose that thinking about product disposal at the time of product acquisition will lead to a higher sense of loss, which in turn will highlight the possession-self link, resulting in higher purchase likelihood.

We further test our theoretical links by examining factors that might influence the extent to which consumers feel a sense of loss while considering the disposal of a product. Based on past research that individual differences exist in the degree to which possessions are used to define one's sense of self, we propose that people who are not strongly tied to their possessions (i.e., have a low self-extension tendency; Ferraro, Escalas, and Bettman 2010), should be less impacted by considering disposing a product. Therefore, we predict that self-extension tendency will moderate whether disposal considerations will influence consumers' product acquisition. Additionally, building on the literature on temporal selves, we argue that people who have difficulty in connecting to their future self (i.e., have a low future-self-continuity; Ersner-Hershfield et al. 2009), should be less likely to feel a sense of loss at the prospect of disposing a possession at a future time. Hence, we expect that future-self continuity will be another moderating variable by influencing whether consumers feel a sense of loss in considering product disposal. We test our predictions across four studies and three product categories.

Study 1 (N = 161) provided initial support for our disposal consideration effect and began with disposal consideration manipulation, where participants in the disposal condition were asked to write about their thoughts and feelings related to disposing a tablet, whereas those in the control condition wrote about the general pros and cons of purchasing the tablet. Next, participants were asked to respond to our dependent measure of likelihood to purchase the tablet (1 = not likely at all, 7 = very likely). The results indicated a significant effect of disposal consideration, with those in the disposal condition (M = 4.88, SD = 1.52) more likely to purchase the tablet compared to those in the control condition (M = 4.35, SD = 1.62), F(1, 159) = 4.52, p = .035.

Study 2 (N = 179) replicated study 1 findings as well as demonstrate that feelings of loss and possession-self link serially mediate the disposal consideration effect, b = .23, SE = .07, 95% CI [.11, .38]. Thinking about product disposal led individuals to feel a sense of loss, which in turn indicated that the product is tied to their sense of self, and ultimately influencing their purchase intentions.

Study 3 (N = 303) demonstrated a boundary condition for the disposal consideration effect, self-extension tendency of using possessions to define one's sense of self, B = .24, SE = .08, t = 3.26, p = .004. For individuals who are high on self-extension tendency, thinking about disposing a painting led them to want the painting more, replicating our disposal consideration effect. But for individuals who are low on self-extension tendency and thus do not use possessions in conceptualizing who they are, thinking about disposing the painting did not have an effect in terms of purchasing the painting.

Study 4 (N = 250) demonstrated another boundary condition for the disposal consideration effect, of how connected individuals perceive their future selves to be in relation to their current selves, B = .59, SE = .23, t = 2.60, p = .010. For individuals who are high on future self-continuity, thinking about disposing a CD set increased their purchase likelihood, replicating our disposal consideration effect. However, for individuals who do not have a sense of continuity to their future selves (i.e., low on future self-continuity), thinking about disposing the CD set had no effect on purchase likelihood.

In documenting a novel effect of considering product disposal on product acquisition decisions, our research makes several theoretical contributions. First, our work extends the product disposal literature in showing that disposal considerations influence consumer decisions before the disposal phase. We also advance understanding of how feelings of loss shape consumer decision-making in showing that feelings of loss increases willingness to acquire a product. Lastly, we enrich work on how the link between consumers' sense of self and their products influence their consumption decisions by demonstrating that thoughts about disposal make the link between the consumer and the possession more salient through feelings of loss.

Give a "Hand"! How Giver/Receiver Hand Image Affects Consumer Charitable Behavior

Chun-Tuan Chang, National Sun Yat-sen University, Taiwan
Hsiao-Ching Lee, National Kaohsiung University of Science and Technology, Taiwan
Yi-Jing Chen, National Sun Yat-sen University, Taiwan
Chia-Han Chang, National Sun Yat-sen University, Taiwan

EXTENDED ABSTRACT

Images of hands are commonly used in charity advertising to demonstrate the importance of helping behavior and then promote charitable donation behaviors. Observations from massive amount of ads suggest numerous ways to present a giver's hand and a receiver's hand. Receivers (beneficiaries) may be humans (e.g., children or elder people in need) or non-humans (e.g., animals). A common way is to present a giver's hand in an upper position and a receiver's hand in a lower position (called as giver's hand up hereafter). On the other hand, some advertisers choose to present a receiver's hand over a giver's hand (called as giver's hand down hereafter).

Researchers have conceptualized power and dominance link to the vertical metaphor (Lakoff and Johnson, 1980). Drawing on the conceptual metaphor theory, we propose that the hand positions of a giver's hand together with a receiver's hand may generate different metaphoric associations. People metaphorically link power with high vertical positions and think of powerlessness in terms of low vertical positions (Koo and Im, 2019; Schubert, 2005).

We propose that hand images can evoke conceptual metaphors in charity advertising. Showing a giver's hand in an upper position relative a receiver's hand makes the giver look stronger, more dominant, and assertive, and taking control of the encounter. This will facilitate the metaphor of "power-is-up," and increase the perceive power and status of a giver. Such perceived power will lead to perceived inequality. Perceived inequity from the image of a giver's hand up will enhance givers' perceived competence. On the other hand, showing a giver's hand down will not make donors feel powerful. Inequality will be less likely to be evoked. Perceived competence will not occur. Nevertheless, the down position of a giver's hand will make the psychological distance between the giver and the receiver closer. Submissive and equal feelings will occur. Givers will tend to feel warm regarding the giving behavior. The warm concerns will then prompt charitable giving behaviors.

In addition, hand gestures play an important role in human communication (Church, Alibali, and Kelly, 2017). Hand gestures serve to increase activation on items in their mental lexicons, therefore facilitating lexical access (Krauss, Chen, and Gottesman, 2000). Pease and Pease (2006) suggested that hands can signal as authority, control-taking, and threatening feelings which are associated with the conceptual metaphor of power. A grabbing gesture shows a palm down, and people project immediate authority. In charity advertising, an image of a giver's hand grabbing a receiver's hand can reinforce the giver's power in the giver-receiver relationship. The conceptual metaphor of "power" shown by a grabbing gesture will be congruent with the image of giver's hand up. On the other hand, a holding gesture is the giver's palm facing up, which is used as a submissive, non-threatening gesture. The receiver will not feel pressured into the relationship and are unlikely to feel threatened by the giver (Pease and Pease, 2006). The palm-up makes people feel equal for the statuses of the giver and the receiver, and promote the closeness between them. It is thus expected that the conceptual metaphor shown by a holding gesture will be congruent with the image of giver's hand down.

Three experiments were conducted. Study 1 was to understand consumers' feeling (e.g., perceived competence and warmth) about the donor's hand position. A two conditions (hand position: a giver's hand up vs. a giver's hand down) between-subjects experimental design was conducted with helping elderly living alone as Stimuli. The aim of Study 2 was to examine the interactive effect of hand position and hand gesture on donate intention. A 2 (hand position: a giver's hand up vs. a giver's hand down) x 2 (hand gesture: holding vs. grabbing) between-subjects design was conducted used dogs as receiver. Study 3 examines the mediation effects of perceived competence and warmth between the interaction of hand position and hand gesture on willingness to donate (WTD). A 2 (hand position: a giver's hand up vs. a giver's hand down) x 2 (hand gesture: holding vs. grabbing) between-subjects design was conducted with helping abused children as Stimuli. We found that the participants perceived higher competence when the giver's hand up (vs. hand down), whereas the participants perceived higher warmth when the giver's hand down (vs. hand up). Furthermore, a grabbing gesture is more persuasive than a holding gesture when presenting a giver's hand up. A holding gesture (vs. grabbing gesture) works better when presenting a giver's hand down. Finally, in the grabbing gesture condition, the indirect effect of the two-way interaction on WTD was through perceived competence, but not through perceived warmth. In the holding gesture condition, the indirect effect of the interaction on WTD was through perceived warmth but not though perceived competence.

Our findings have theoretical contributions. First, drawing on and extending the research on conceptual metaphor theory, our study demonstrates that images of hand shown in charity advertising can affect people's perceptions and behaviors. Second, this research contributes to the power literature by displaying hand position and hand gesture to enhance or reduce power perceptions. Third, conceptual fluency can be maximized by either increasing perceived competence or warmth subject to the combination of hand position and hand gesture.

Care in Consumption

Andreas Chatzidakis, Royal Holloway University of London, UK
Giana Eckhardt, Royal Holloway University of London, UK
Katharina Husemann, Royal Holloway University of London, UK

EXTENDED ABSTRACT

We are in the midst of an unprecedented "crisis of care," for both people and the planet. There is widespread acknowledgment, from sources as diverse as the World Economic Forum, Extinction Rebellion, and pundits such as Naomi Klein (*On Fire,* 2019) that the earth is in a state of emergency, and urgent action is needed for society not to fall into collapse. Influential academics such as Nancy Fraser (2016) have referred to the current societal and environmental crisis as a systemic failure of care. The consumer's prominence in popular culture discourses of care has also been high; veganism, for example, is framed as a way individuals can express their care for the environment, and has resulted in fast food chains such as Subway, KFC and Burger King launching high profile vegan options.

Meanwhile, care is increasingly marketized and commoditised, from the growth of the wellness and self-care industries to new platforms such as www.care.com. The need to care, and for it to be offered via commercial services, is becoming more prominent. Because of the socially accelerated nature of contemporary modernity (Husemann and Eckhardt 2019), consumers no longer have time to provide intimate, non-market mediated care for their loved ones. Thus, care is outsourced. While care for others or for oneself have always existed, we are currently seeing a marked rise in market-mediated care in consumption.

Yet, the full theoretical scope of what care can mean for consumption has yet to be explored. Although implicit references to care are commonly made within various consumer studies (Shaw, McMaster and Newholm, 2016), more explicit understandings fall within three relatively small traditions including the role of care in therapeutic (e.g. Tian et al. 2014; Mittal and Griskevicius, 2016) and familial settings (e.g. Epp and Valagaleti, 2014) as well as within ethical consumption (e.g. Chatzidakis et al. 2018). While these studies have usefully increased understanding of health care provision, family dynamics and how consumers' morality can be informed by a care ethic, we suggest that care can be understood at a more fundamental level within consumer research.

Based on a review of care across disciplines, we build on care theory (Tronto and Fisher, 1990; Tronto, 2020; Eisler, 2008) to define care in consumption as everything consumers do to cultivate, maintain or redress the wellbeing of themselves, others or the environment. We foreground *care as an organizing perspective*, which allows us to see consumption in a new theoretical light. That is, care is not a motivator or variable which fluctuates among consumers (as in the consumer ethics and family consumption literatures, where some consumers are more caring than others; e.g. Shaw, Carrington and Chatzidakis, 2016; Epp and Valagaleti 2014). Rather, care entails everything that ensures our welfare and enables our flourishing (e.g. from a safe and loving home to high quality care in education and health sectors) across different scales of everyday activity, from the home to the local to the national to transnational (e.g. Chatzidakis et al., 2020). Care in consumption has three characteristics: interdependence, vulnerability and ambivalence. The care diamond, which is a prominent conceptual framework within care economics, introduced by Shahra Razavi (2007), captures this broadening of care systematically and explains how care, in any given society, is provisioned by four key pillars: families, communities (including voluntary and non-profit sectors), markets, and states. According to this model, every care need an individual has is addressed (whether paid or unpaid) by one or a combination of all four.

We build on the care diamond to develop a model of care in consumption which makes the market a more central pillar. Our rationale is that beyond individual country differences, markets and logics of marketization have consistently played a far more central role in care provision across the global North (e.g. Farris and Marchetti, 2017). That is, markets are not simply one among four pillars that consumers access. Rather, over the last four decades, markets have (also) infiltrated the traditional spaces and underlying logics of the other three pillars by introducing buyer-seller relationships and market-like mechanisms.

A broadened conceptualisation of care in consumption that highlights both the central role of markets and the dynamics and contradictions entailed in consuming marketized familial, community and state care provision will help consumer researchers to contribute to the multidisciplinary conversation on care as it relates to environmental and social concerns; and to develop consumption-specific understandings of how care manifests in the market. In particular, we make the following contributions to consumer research and marketing thought.

Understanding consumption from a caring perspective allows us to challenge and move forward well-established domains in consumer research. We push current understandings of the sovereign consumer by illustrating how interdependency underpins any type of consumption activity, reliant as it is on dynamic reconfigurations of familial, community, market and state provision. Our care perspective also challenges current conceptualizations of the vulnerable consumer as restricted to particular demographic segments (Baker et al., 2005; Hill and Stamey, 1990) or critical episodes (Humphreys and Thompson, 2014). In contrast, a caring perspective emphasises the latency of vulnerability: all consumers are potentially vulnerable at all times but whether they experience their vulnerabilities depends on the depth and breadth of their care provision, or lack thereof. Finally, we also contribute to literature on consumer ambivalence (Otnes et al., 1997; Sipilä et al., 2018) by foregrounding a more profound and stubbornly pervasive role for ambivalence. It is inherent to all consumer caring relationships and practices and can be particularly unpleasant, daunting and exhausting.

By examining the broader role of care in consumption, we also offer a series of public policy implications, both with respect to the central role of markets and consumption in enabling and undermining specific forms of care, and the dynamics and contradictions entailed in marketizing familial, community and state care provision.

The Hidden Cost of Conspicuous Consumption for Job Applicants

Charlene Y Chen, Nanyang Technological University, Singapore
Andy J Yap, INSEAD, Singapore
Stefan J Thau, INSEAD, Singapore

EXTENDED ABSTRACT

This research shows that job applicants are less likely to be hired when they conspicuously consume because they are seen as having lower need for the job and therefore less motivated to work hard. The effect is mitigated when the job is high-status and when applicants' high motivation is signaled.

Conspicuous consumption refers to the consumption of luxury goods that, intentionally or inherently, signal one's desire for superior social status (Bagwell & Bernheim, 1996; Veblen, 1899). Our research examines the effects of conspicuous consumption by job candidates on their hiring outcomes (person-to-job fit, hirability). Examining this question is important for several reasons. There is an intimate connection between consumption and work. Most people work to earn money, and people need money for consumption. In turn, consumption experiences are then shared with social systems consumers interact with (e.g. family, workplaces, clubs). It is noteworthy that the intersection between work and consumption has received little attention while for example, the intersection between work and family, and the problems that come with it, has defined an entire stream of research in organizational behavior. People often communicate a preference for luxury goods by, for example, wearing expensive clothes and watches, posting pictures of themselves and their luxury possessions on social media, and talking about high-end vacations experiences. Job candidates are no exception. Indeed, entire discussion threads in online forums (e.g., Quora, 2017; Reddit, 2016; Rolexforums, 2009) are dedicated to debates on what to wear to job interviews and which brands make more positive impressions on employers. In a pilot study we found that more than a third of the participants chose to display conspicuous consumption at job interviews.

The lack of attention on conspicuous consumption and its effects for interactions with organizations is also surprising because conspicuous consumption is becoming more widespread. Materialism—the importance placed on wealth and conspicuous consumption—is at historically high levels, especially among millennials (Twenge & Kasser, 2013) who are now the largest generation in the US labor force (Fry, 2018). Finally, compared to other goods, luxury goods are more salient to people because these goods tend to be costly and not everyone can afford them (Bagwell & Bernheim, 1996; Veblen, 1899). Hence, conspicuous consumption is likely to draw the attention of social observers, especially those who are seeking to form social impressions of others (Fiske & Taylor, 2013). This makes it very likely that decision makers will attend to conspicuous consumption by job candidates and use this in their evaluation. Overall, it is important to address if conspicuous consumption by job candidates have a positive or negative impact on their job-seeking outcomes.

Why would job candidates engage in conspicuous consumption? Are there any benefits from doing so? Research suggests that people often use consumption as a means to communicate a desired identity and a positive impression to others (Aspers & Godart, 2013; Belk, 1988). Job candidates may do so to show that they are more competent, intelligent, and successful than those who cannot afford to consume conspicuously (Christopher & Schlenker, 2000). According to costly signaling theory, wasteful behavior that has little functional utility accords social status (Miller, 2009; Zahavi, 1975). The ability to own products whose price far exceeds their utilitarian value signals that one can afford what others cannot and therefore one's superior ability to acquire such wealth. However, we propose that engaging in conspicuous consumption may penalize job candidates, particularly when they apply for low-paying jobs. We build our theory on prior research suggesting that employees whose needs are not met by their job tend to be less motivated at work (Cable & DeRue, 2002; Saks & Ashforth, 1997; Vroom, 1964) and power dependence theory which postulates that organizations can extract more value from employees who are more dependent on the job to fulfill their needs (Blau, 1964; Emerson, 1962). Based on this literature, we posit that organizational decision makers would be less favorable toward job candidates who conspicuously consume because these candidates would be seen as having lower need for the job to earn money and therefore less motivated to work hard. We argue that this is because job candidates who conspicuously consume are seen as being able to afford an expensive lifestyle and thus not needing the job to make a living, especially when money is the most salient incentive that this job provides (e.g., low-paying jobs). Consistent with expectations, our studies show that compared to candidates who do not conspicuously consume, candidates who conspicuously consume tend to be perceived as having poorer fit to the job and therefore less hirable. In summary, we develop and test a theoretical model which explicates how candidates' conspicuous consumption would lead decision makers to form these negative impressions of them, which correspondingly undermine their chances of getting hired. In addition, we examine boundary conditions for our basic effect by considering jobs that differ on job salary and job status. We describe next our theoretical model, hypotheses and findings.

Needs and Supplies Fit

Organizational decision makers often ascertain job candidates' fit with the organization in terms of their person-organization fit, needs-supplies fit, and demands-abilities fit (Cable & DeRue, 2002). Our research focuses on needs-supplies fit which is the perceived degree to which the candidates' needs will be adequately rewarded by the organization for their work. We propose that in the selection context, job candidates' need for money becomes particularly salient when they display conspicuous consumption because of the inherent connection between luxury consumption, money, and larger prices (Veblen, 1899). We argue that this leads organizational decision makers to consider whether the job can fulfill this candidate's need. By definition, a low-paying job is less likely than a high-paying job to provide enough wages for their employees to sustain a luxurious lifestyle. In addition, candidates who conspicuously consume (vs. those who do not) would be deemed as already possessing the financial resources to afford such a lifestyle and therefore not needing the low-paying job to make money. If the job cannot supply the incentives that are needed and valued by candidates, they will be less motivated to work (Vroom, 1964) and thus employers will be unable to extract maximum value from them (Emerson, 1962). Hence, we propose that this misalignment in needs-supplies fit would undermine candidates' chance of getting hired. In sum, we predict that the display of conspicuous consumption by job candidates would lower their chance of being hired for low-paying jobs (H1). We further predict that this relationship would be sequentially mediated by decision makers' per-

ception of the candidates' need for the job to earn money and their evaluation of the candidates' fit with the job (H2).

We report six studies that adopted a hiring simulation paradigm in which participants played the role of organizational decision makers who evaluated a job candidate for a particular position. They were shown information that is typically provided to interviewers (i.e., job scope, candidate's resume) and then presented with either information about the candidate's luxurious consumption behavior (conspicuous consumption condition) or information that did not depict such consumption behavior (control condition). For example, they were told that they were scheduled to interview a job candidate that day and happened to notice that this candidate drove a particular car (e.g., BMW vs. Toyota) and wore a certain attire to the interview (e.g., Rolex vs. Casio watch). Finally, they were asked to evaluate the candidate and indicate their likelihood of hiring this person for the job. Studies 1-3 tested H1 and H2. We varied the way conspicuous consumption was presented (photos, Facebook, conversations), the type of jobs (administrative assistant, junior sales representative), and participant sample (working adults in the US and Singapore, and Students) across these studies. All three studies found strong support for H1 and H2.

High-Paying Jobs: When Conspicuous Consumption Is A Weaker Cue For Need

We expand our theoretical model by examining whether our hypotheses would also hold for high-paying jobs. Unlike low-paying jobs, these jobs often require employees to make executive decisions that impact the organization's performance (Amason, 1996; Hambrick & Mason, 1984), and therefore tend to employ people who are more educated, highly-skilled, and/or have considerable experience and track record in the industry. Given that high-paying jobs pay well enough for employees to afford luxury goods, there is no violation of expectations when candidates for such jobs conspicuously consume. Organizational decision makers will attribute conspicuous consumption by candidates for high-paying jobs to income from a high-paying job.

By contrast, they will attribute conspicuous consumption by candidates of low-paying jobs to financial sources other than income from working in a low-paying job because these jobs do not pay enough for such luxurious consumption. Hence, while conspicuous consumption is a strong signal of candidates' (low) need for the job to earn money when the job is low-paying, it is less diagnostic of whether candidates need the job to earn money when the job is high-paying. Thus, we posit that (H3) Job pay interacts with conspicuous consumption to impact organizational decision makers' perceptions of job candidates' need for the job to earn money. For low-paying jobs, decision makers would perceive candidates who conspicuously consume as needing the job less to earn money compared to candidates who do not conspicuously consume. However, this effect is weaker for high-paying jobs. In Study 4, HR Professionals from the US participated in an experiment which employed a 2 (conspicuous consumption vs. control) × 2 (low-paying; administrative assistant vs. high-paying job; senior vice-preseident) between-subjects design.

Results supported H3. We also found preliminary support that conspicuous consumption can benefit candidates who apply to high-paying jobs.

High-Status Jobs: When Conspicuous Consumption Is A Cue For Need For Money But Not Other Needs

We further expand our theoretical model by examining another moderator of our basic effect—the social status ascribed to the job.

We define job status as how respected people generally perceive the job to be (Cheng, Tracy, & Anderson, 2014). Although job pay and job status often go hand-in-hand, in some instances low-paying jobs attract societal respect. For example, a person employed as a paramedic or a high-school football coach may be relatively more respected compared to a dishwasher or shelf stacker yet these are also jobs which provide relatively little pay. People may choose to work in these high-status jobs that offer less pay because these jobs supply other forms of rewards (e.g., opportunity to help or benefit others) that fulfill other needs that may be important to them (e.g., respect). Hence, we posit that conspicuous consumption by job candidates applying to a low-paying/high-status job would still signal that these candidates do not need this job to earn money because this job will not pay enough for them to afford an expensive lifestyle. However, organizational decision makers would perceive these candidates to be a good fit for the job insofar that these candidates are presumed to be applying to this job to fulfill other needs that can be met by the job. Thus, we propose that (H4) keeping low-pay constant, job status interacts with conspicuous consumption to impact organizational decision makers' evaluation of job candidates' fit for the job. For low-status jobs which offer pay as the main incentive, decision makers would evaluate candidates who conspicuously consume as having poorer fit for the job compared to candidates who do not conspicuously consume. However, this effect would be weaker for high-status jobs. Study 5 found support for H4 using an experiment that employed a 2(conspicuous consumption vs. control) × 2(low-status job; dishwasher vs. high-status job; paramedic) between-subjects design.

Signaling Candidate's High Motivation

Finally, we explicitly test our theory's mechanism that job candidates for low-paying jobs are penalized when they display conspicuous consumption because they are perceived as being less motivated to work hard in the job they are applying to. We adopt two approaches to test this account: 1) attenuating the negative effect of conspicuous consumption on evaluations of fit and hirability by introducing a cue to signal candidates' high motivation; and 2) measuring perceived motivation of candidates and examining whether it mediates the effect of conspicuous consumption on evaluation of the candidates' fit for the job and hirability. In Study 6, we predicted and found that decision makers evaluating candidates who conspicuously consumed would judge the candidates to have better fit and be more hirable when the cue about the candidates' motivation is present than when this cue is absent (H5). In addition, we found a sequential mediation effect with candidates' need for money, perceived motivation, and fit with the job mediating the relationship between conspicuous consumption and hirability (H6). The recruitment context is a critical setting where job candidates generally try to impress organizational decision makers. Displaying luxury consumption may seem like a reasonable impression management strategy to candidates to create a positive impression in decision makers. Consistent with this argument, both anecdotal evidence from online discussions and data from our pilot study suggest that many people choose to display their conspicuous consumption when interviewing for jobs. However, contrary to the largely positive and status- enhancing effects of conspicuous consumption described in past research, we found that such behavior is detrimental when candidates apply to jobs that pay less and have lower status because they would be seen as having lower need for the job to earn money and therefore being less motivated to work hard at the job. We contribute to the literature on the effects of consumption behavior in organizational settings by studying how job candidates' conspicuous consumption behavior may adversely impact their hiring outcomes.

While it is plausible that participants in our studies deemed the candidates who displayed conspicuous consumption as showing hubris, this alternative account cannot fully explain the current results. In particular, candidates for high-paying jobs and low-paying/high-status jobs were not penalized for displaying conspicuous consumption compared to candidates for low- paying/low-status jobs. In fact, conspicuous consumption was beneficial to candidates for high-paying jobs. We believe that our theoretical framework on needs-supplies fit is more parsimonious and considers more clearly the instrumental concerns salient for decision-makers in the selection context. One may also question the external validity of our conclusions given that job candidates for low-paying-low-status jobs likely comprise individuals who are relatively less able to afford luxury goods. According to a survey conducted by Deutsche Bank Research (Albrecht, 2017), the lowest-income households in the US devote 40% of their consumption expenditure to luxury goods, purchasing, for example, expensive cars on credit and incurring substantial debt as a consequence. Hence, it is quite realistic for individuals at the bottom of the hierarchy to conspicuously consume to elevate their social status and impress others. Finally, one alternative explanation for our results is that displaying conspicuous consumption is

counter-stereotypical for individuals who are from a lower social class. Given that candidates who apply to low-paying/low-status jobs tend to be financially less well-off, they are not expected to be able to afford expensive luxury goods. This stereotype violation in turn negatively influences organizational decision makers' evaluations of fit. While we believe this is a plausible account for our basic finding, it is less tenable for our pattern of results in Study 5 and thus cannot fully explain the data. Specifically, stereotype violation should apply to conspicuously consuming candidates for the paramedic job, but they were not penalized.

When Do People Pay It Forward: The Positive Effect of Disclosing Help Provider's Name on Generalized Reciprocity

Yunqing Chen, The Chinese University of Hong Kong, China
Leilei Gao, The Chinese University of Hong Kong, China

EXTENDED ABSTRACT

We all had the experience of receiving help from strangers. Prior research on helping behavior has suggested that, after receiving a help, people could reciprocate the favor back to the help provider, or choose to forward the favor to a third party (Greiner and Levati 2005; Stanca 2009; Tsvetkova and Macy 2014). The former is referred to as direct reciprocity (if A helps B then B helps A; Cialdini 2009; Nowak 2006) whereas the latter is termed as generalized reciprocity (if A helps B then B helps C; Nowak 2006). While research has demonstrated the conditions that facilitate direct reciprocity (Gergen et al. 1975; Gouldner 1960; Greengberg 1980), it is not clear what factors would promote help recipients' tendency to engage in generalized reciprocity.

In this research, we examine the influence of name disclosure of a help provider on the help recipient's likelihood of forwarding the kindness to a third party in subsequent situations. Across four studies, we find that compared to receiving help from a stranger whose name is not disclosed, merely knowing the name of the help provider leads people to perceive the help provider as a salient and unique individual. This process results in an elevated motivation to reciprocate and subsequent an engagement in generalized prosocial behavior, especially when direct reciprocity is not available.

Studies 1a and 1b provided initial evidence of the proposed effect. In study 1a (N = 132), we designed a blind taste test as our cover story and observed participants' disposal of used paper cups. Participants first participated in a blind taste test in which they were provided with two small cups of sports drink. In the second task, participants read a scenario in which they posted an online message in a local forum asking for recommendations on haircut. They received a reply from another user whose name was either displayed or not. After completing both tasks, participants were instructed to "dispose of the used papers cups on the way out". And the results showed that participants were more likely to recycle the cups when the help provider's name was disclosed than when the person was anonymous (47.1% vs. 26.6%, p = .016).

In study 1b (N = 132), participants first read a scenario in which they were raising money on GoFundMe.com. Participants were presented with the 15 most recent donations. To manipulate name disclosure, in one condition, all 15 donors' names were disclosed, and in the other condition, the donors were all marked as "anonymous". In the next task, participants were asked to help a charity, World Wildlife Foundation (WWF), to design new slogans. As expected, participants in the name disclosure condition provided more slogans than those in the no name disclosure condition (3.29 vs. 2.60; p = .035).

Study 2 (N = 217) provided support for the proposed mechanism by manipulating the recipient's motivation to reciprocate. Previous research has suggested that the recipient's motivation to reciprocate could be affected by the locus of causality of the help provider's action (Greenberg 1980). That is, if a person offers help because s/he is supposed to do so (not because s/he wants to do so), the recipient is less motivated to reciprocate. This study used a 2 (name disclosure: yes vs. no) × 2 (help provider's role: user vs. staff) between-subjects design. Participants first read a scenario in which they asked a question on a website and received an answer either from a website user or from a website support staff. The name of the helper was either disclosed or not. Then participants read a short article about a char-ity organization, and indicated their willingness to contribute to the charity upon winning a prize draw of $20. As predicted, when the help provider was a user of the website, name disclosure led the recipient to donate more money to the charity (8.95 vs. 6.83). However, when the help provider was a support staff, name disclosure had no influence on the recipient's donation amount (5.67 vs. 7.12).

Study 3 (N = 295) provided more evidence on the underlying mechanism of reciprocity motivation. According to our theory, recipients engage in generalized reciprocity because direct reciprocity is not available. If, however, people can reciprocate the kindness back to the help provider, even in the form of expressing their gratitude, the positive effect of name disclosure will be attenuated. This study used a 2 (name disclosure: yes vs. no) × 2 (gratitude expression: present vs. absent) + 1 control condition between-subject design. We adopted the same scenario and manipulation of name disclosure as in Study 1a. In addition, one group of participants was asked to imagine that they had replied to the help provider with a thank-you note. The other group of participants was not provided the information. Participants in the control condition did not read the scenario and directly proceeded to the next task. Next, participants indicated their likelihood of engaging in 18 different consumption behaviors which composed of six positive behaviors (e.g., "donate used items/clothing to a charitable organization to help those families in need"; adapted from Cavanaugh, Bettman, and Luce 2015; α = .73), six negative behaviors (e.g., "say nothing when the waitress miscalculates the bill in your favor"; adapted from Babakus et al. 2004; α = .83) and six neutral behaviors (e.g., "see a foreign film"; adapted from Cavanaugh et al. 2015; α = .71). As predicted, when gratitude was expressed, the positive effect of name disclosure on prosocial tendency was attenuated. In addition, compared to the control condition, those participants who knew the help provider's name but had no chance to express their gratitude indicated stronger prosocial behavior tendency.

To summarize, this research contributes to reciprocity literature by demonstrating the condition in which generalized reciprocity exists. In addition, our findings highlight the key role or reciprocity motivation in driving generalized reciprocity. Finally, our research has practical implications on "how" people should offer help to those in need.

"The Wellness Religion": Consuming Purity as an Aspirational Lifestyle

Tianqi Chen, Boston University, USA

Neeru Paharia, Georgetown University, USA

EXTENDED ABSTRACT

The glories of living an indulgent lifestyle have long been celebrated. However, over the last decade, it has been hard to ignore the growing emergence of an opposing trend, one that celebrates treating one's mind and body as a temple, rather than a vehicle for indulgence; one that prioritizes investing in one's physical and mental wellness over investing in extravagant products and luxurious experiences. Wellness consumption has transformed from a niche practice to a \$4.2 trillion-dollar global industry in 2017 (Global Wellness Institute 2018).

In the present research, we explore the phenomenal rise of brands, products, and services representing a wellness lifestyle. We propose that the wellness lifestyle has become a new form of aspirational living for consumers. We argue this trend is driven in part by consumers' motivations to find ways to center and detoxify themselves from an increasingly chaotic world. The frantic pace of modern life, the polluted environment, and the number of things competing for our digital attention at any one time are making consumers feel overwhelmed and ungrounded. While historically many dealt with the chaos of the world through religion (e.g. attending services, rituals, praying, fasting, etc.) (Cutright 2012: Mathras, et al. 2016; Preston, & Ritter, 2012), the rise of secularism has created a vacuum where the need for purity and self-actualization has gone unmet. Wellness acts a new type of religion, one that exists in the commercial sphere, but that also allows consumers to achieve the need to detoxify their minds and bodies as it classifies the "sacred" (e.g., organic food, meditation, nature.) from the "profane" (e.g., unhealthy food with preservatives, ; Douglas, 1966).

Hypothesis 1:   *Compared to other traditionally aspirational lifestyles (i.e., indulgent lifestyle, luxury lifestyle, intellectual lifestyle, busy-at-work lifestyle, religious lifestyle), a wellness lifestyle is more aspirational.*

Hypothesis 2:   *The aspirational appeal of a wellness lifestyle, compared to other lifestyles, is mediated by perceived purity.*

Hypothesis 3:   *The aspirational appeal of a wellness lifestyle will be positively moderated by cuing people to think about the toxins of modern life.*

Hypothesis 4:   *A wellness lifestyle will satisfy nonreligious people's need for purity. A wellness lifestyle and a religious lifestyle will satisfy religious people's need for purity.*

Pilot study analyzed 200 twitter posts that use the #wellness hashtag and identified four main categories of wellness practices: 1. Mindfulness and relaxation techniques 2. Exercise and fitness 3. Nutritious food and healthy diet, and 4. Sleep quality and quantity, which validated our definition of wellness consumption and suggested that wellness practices as an effective way to deal with negative and toxic elements in the world and in one's life, body, and mind, and that purity is a central objective.

In Study 1a we interviewed both church goers (N = 15) and wellness consumers (N = 15) to document the similarities and differences between the practices. A few themes emerged from the interviews, which highlighted the purpose of purification that was once predominantly realized through religious practices, and now also achieved by wellness practices. We then generalized the findings to a broader and more diverse population with a lab survey (N = 140) and again documented the similarities between wellness and religious practices, and derived the major theme of purity that motivates the dedication to wellness lifestyle.

In Study 2a (N = 404), we conducted a lab experiment and compared wellness lifestyle to two other traditionally aspirational lifestyles, an indulgent luxury lifestyle and an intellectual lifestyle. Participants read a description of a fictitious NFL player's weekend regular activities that imply his overall lifestyle. Consistent with H1, participants rated the NFL player's lifestyle significantly different in terms of its aspirational appeal across the three conditions ($F_{(2,401)} = 101.14$, $p < .001$, $\eta_p^2 = .34$). Participants perceived the NFL player's lifestyle as more aspirational in the wellness condition (M = 5.44, SD = .97) than in the indulgent lifestyle (M = 3.49, SD = 1.45; 95% Confident interval: 1.67 to 2.24), or in the intellectual lifestyle (M = 5.08, SD = 1.12; 95% Confident interval: .08 to .65). We replicated the result with a broader population (N = 278) on mTurk in support of H1 ($F_{(2,275)} = 70.91$, $p < .001$, $\eta_p^2 = .34$). Participants were also more interested in purchasing the NFL players' book featuring his lifestyle when he had a wellness lifestyle (M = 3.74, SD = 1.77), than an indulgent lifestyle (M = 2.27, SD = 1.75, 95% CI: .95 to 1.99), or an intellectual lifestyle (M = 3.13, SD = 1.90, 95% CI: .083 to 1.13).

Study 3a (N = 322) compared wellness lifestyle to three other lifestyles (i.e., busy-at-work, entertainment, and beauty) and examined the mediating role of perceived purity. Confirming both H1 and H2, the wellness lifestyle was rated as more aspirational than the busy-at-work lifestyle (M = 5.02, SD = 1.23 vs. M = 4.14, SD = 1.50, $p <.001$), the entertainment lifestyle (M = 5.02, SD = 1.23 vs. M = 3.35, SD = 1.34, $p <.001$), and more aspirational than the beauty lifestyle (M = 5.02, SD = 1.23 vs. M = 3.79, SD = 1.49, $p <.001$; $F_{(3, 317)} = 21.29$, $p < .001$, $\eta_p^2 = .17$). Mediation analysis showed that perceived purity fully mediated such effect (.26; 95% CI [.18, .35]; Hayes, 2015). The effect of different lifestyles on aspiration became insignificant after including purity as the mediator (-.029; 95% CI [-.16, .10]). Study 3b (N = 335) replicated the result with a different context by using different collections of products to represent different lifestyles. Compared to a luxury lifestyle, or a mainstream lifestyle, wellness lifestyle was rated as more aspirational ($F_{(2,332)} = 13.93$, $p < .001$, $\eta_p^2 = .08$). A mediation analysis showed a significant indirect effect for the mediation path through purity, comparing the wellness lifestyle and the luxury lifestyle (.51; 95% CI [.29, .79]), and comparing the wellness lifestyle and the average lifestyle ((.15; 95% CI [.02, .31]).

In Study 4 (N = 264), we further tested the role of purity by directly manipulating consumers' world view that results in different level of need for purity (i.e., priming consumers to consider the toxins of modern life vs. control). We used a realistic measure to assess consumers' intention – New Year's resolutions for 2020, and conducted this experiment on the first week of 2020. In support of H3, a 2 (world view prime: toxic world vs. convenient world) by 2 (New year resolution type: wellness resolutions vs. money and career resolutions) mixed ANOVA showed a significant interaction between

the prime condition and the type of resolutions ($F(1, 262) = 4.91$, $p = .028$, $\eta_p^2 = .02$). when primed with the world view that modern life is becoming more and more toxic, participants listed more wellness resolutions (M = 1.53, SD = .91), compared to the control condition where participants were primed with the world view that modern life is becoming more convenient (M = 1.22, SD = .89; 95% CI [.097, .532]). There was no significant difference between the two priming conditions for the number of money and career related resolutions listed (M_{toxic} = .56, SD_{toxic} = 67 vs. $M_{convenient}$ = .60, $SD_{convenient}$ = .72, 95% CI [-.211, .125]).

To test H4, we prescreened participants based on their religiosity in Study 5 (N = 473) and compared wellness lifestyle to religious lifestyle and a mainstream lifestyle. The result replicated the main effect that the wellness lifestyle (M = 5.49, SD = 1.31) was seen as significantly more aspirational than both the religious lifestyle (M = 4.85, SD = 1.84; 95% CI[.31, .98]) and the mainstream lifestyle (M = 4.23, SD = 1.35, 95% CI[.93, 1.6]; $F(2,470) = 27.15$, $p < .001$, $\eta_p^2 = .104$). Religiosity moderated participants' aspiration for different lifestyles ($F(2, 470) = 5.06$, $p < .01$, $\eta_p^2 = .021$). Non-religious participants found the wellness lifestyle (M = 5.35, SD = 1.30) significantly more aspirational than either the religious lifestyle (M = 4.26, SD = 1.76; 95% CI[.62, 1.54]) or the mainstream lifestyle (M = 4.12, SD = 1.28; 95% CI [.77, 1.69]). Religious participants saw wellness lifestyle (M = 5.65, SD = 1.33) as equally aspirational as the religious lifestyle (M = 5.44, SD = 1.73, 95% CI [-.25, .68]), which were both more aspirational than the mainstream lifestyle (M = 4.33, SD = 1.42; 95% CI = [.85 to 1.78], and [.64, 1.57]). A similar pattern of results was found for purity. Religious participants saw both the wellness and religious lifestyles as purer than the mainstream lifestyle, which mediated the view of being an aspirational lifestyle (wellness vs. mainstream: indirect effect =.51; 95% CI: .28 to .76; religious vs. mainstream: indirect effect =.24; 95% CI: .11 to .37). Non-religious participants saw the wellness lifestyle more aspirational than the mainstream lifestyle due to its increased level of purity (indirect effect =.55; 95% CI: .31 to .77). There was no mediating effect of purity for the religious lifestyle (compared to mainstream) on aspirations (indirect effect =.06; 95% CI: -.02 to .16).

Study 6 (N = 226) examined the effect of wellness positioning and labeling of products on consumer behavior and marketing relevant measures (i.e., influencer effectiveness, and conspicuous display). We also examined the response of different market segments that are commonly stereotyped as more or less interested in wellness products by establishing the broad appeal of wellness among consumers across genders and different political orientations. Across conditions (wellness vs. control, we either labeled the product (e.g., juice) as wellness product or not and create a regular consumer of this product. The result showed a significant main effect of wellness positioning on the three dependent variables: the wellness product was perceived to be associated with a more aspirational lifestyle ($F(1, 224) = 43.19$, $p < .001$, $\eta_p^2 = .16$; $M_{wellness}$ = 4.90, $SD_{wellness}$ = 1.36, $M_{control}$ = 3.81, $SD_{control}$ = 1.13); participants were more interested in learning more about and purchasing products when the regular consumer recommended a wellness product ($M_{wellness}$ = 4.35, $SD_{wellness}$ = 1.67) than control ($M_{control}$ = 3.53, $SD_{control}$ = 1.52; $F(1, 224) = 14.86$, $p < .01$, $\eta_p^2 = .062$); wellness positioning significantly increased interest in conspicuous display of the product (talking about the product and posting pictures of it on social media) ($M_{wellness}$ = 3.24, $SD_{wellness}$ = 1.79, $M_{control}$ = 2.48, $SD_{control}$ = 1.56; $F(1, 224) = 11.65$, $p = .001$, $\eta_p^2 = .049$). Purity mediated such effects (Aspiration: .19; 95% CI [.05, .36]; Influencer effectiveness: (.39; 95% CI [19, .63]; Conspicuous display: .24; 95% CI [07, .44]). The effect of wellness positioning was quite similar and consistent across different demographic seg-

ments (i.e., liberal men, conservative men, liberal women, conservative women).

Our findings contribute to four streams of research. Our work contributes to the literature of luxury marketing and symbolic consumption; while past research has demonstrated that indulgent and luxurious lifestyles are more appealing (Ordabayeva and Chandon 2011; Wang and Griskevicius 2014; Ward and Dahl 2014), we find evidence that today, a wellness lifestyle has become more aspirational. Second, we build off past work in consumer behavior which documents how themes of religion are reflected in consumer behavior (Mathras, Cohen, Mandel, and Mick 2016; Belk, Wallendorf, and Sherry 1989; Muniz and Schau 2005; Shachar, Erdem, Cutright, and Fitzsimons 2010). Our work demonstrates that wellness carries religious undertones and serves to satisfy consumers' needs for purity. Third, we conceptualize purity more in a broader context than previous literature (Graham et al. 2011) that does not condemn certain practices, but rather is enabled through the pursuit of detoxification which is central to the promise of the wellness lifestyle. We show that wellness is a commercially viable vehicle for purity, and also one that may appeal to a wider set of individuals. Our research also contributes to current research on the consumption of healthy food products (Andre, Chandon, and Haws 2020; Cadario and Chandon 2020; Haws, Walker, and Sample 2017; Juhl, Fenger, and Thøgersen 2017; Scott, Rozin, and Small 2020, Tangari, Bui, Haws, and Liu 2020) by identifying religious elements and themes in how consumer perceive and consume wellness related products.

How Do Natural Disasters Affect Consumers' Desire for Luxuries?

Ning Chen, Zhejiang University of Finance and Economics, China
Francine E. Petersen, HEC Lausanne, Switzerland

EXTENDED ABSTRACT

Natural disasters are defined as rapid, instantaneous or profound impact of the natural environment upon the socio-economic system (Alexander 1993), or as a sudden disequilibrium of the balance between the forces released by the natural system and the counteracting forces of the social system (Alcántara-Ayala 2002). Previous research reveals effects of natural disasters in opposing directions for different types of hedonic consumption. For example, disaster victims of Hurricane Katrina engaged in more impulsive purchases (Sneath, Lacey, and Kennett-Hensel 2009), and after the 2013 Ya'an (in Sichuan Province, China) earthquake, victims increased their uses of hedonic apps on mobiles (Jia et al. 2016). Yet, alcohol consumption decreased after the Great Hanshin earthquake in Japan (Shimizu et al. 2000). As far as we know, little research has directly investigated the effect of natural disasters on luxury consumption. Inferred from previous research results, the effects of natural disasters on luxury consumption could be either positive or negative (Jia et al. 2016; Mauchauffée, Lemaire, and Magnier-Watanabe 2012). According to a survey launched by McKinsey in 2011, 20% of Japanese luxury clients reported that they were less interested in purchasing luxuries after the 2011 Great East Japan earthquake. But is it so?

We introduce conspicuousness as a moderator of the effect of natural disasters on luxury consumption. Conspicuous consumption can be defined as "the act of buying a lot of things, especially expensive things that are not necessary, in a way that people notice" (Longman American Dictionary, 2000, p. 296). For consumers, the main purpose of buying conspicuously branded goods is to signal to the masses that they are different from them, while consumers who buy inconspicuously branded goods aim to signal to high-status peers that they are like them (Han, Nunes, and Drèze 2010).

From the perspective of increased interpersonal trust, we would expect natural disasters to decrease desire for conspicuous (vs. inconspicuous) luxuries. Conspicuous consumption results from people's desire to enhance social prestige, to show social status, and to signal their wealth and achievements (Chaudhuri and Majumdar 2006; O'Cass and Frost 2002; Shukla 2008; Wong and Ahuvia 1998). So it is inevitable that conspicuous consumption reinforces social hierarchy and social comparison (Kapferer 2010; Shukla 2008). From the perspective of risk reduction, however, we would expect natural disasters to either increase or do not affect desire for conspicuous luxuries because enhancing status could reduce perceived (social) risk.

This research contributes by investigating the effect of natural disasters on desire for luxury brands and by suggesting brand conspicuousness as a moderator. We find that natural disasters have a negative impact on desire for conspicuous luxuries, but not for inconspicuous luxuries or non-luxuries. Under some conditions, which need to be further investigated, we found a positive effect.

Using search engine query data (real behavioral data from Google), we find that the conspicuousness of luxuries moderates the effect of natural disasters on consumers' desire for luxury consumption. We used the 2011 Great East Japan earthquake and the 2012 Hurricane Sandy in the U.S. as two naturally occurring events to explore the effect. We operationalized consumers' desire for conspicuous luxuries via the search volume for luxury fashion brands on Google (Armani, Burberry, Chanel, D&G, Hermes, Louis Vuitton, Ralph Lauren). These brands usually use "loud signals" (e.g., logos) that everyone can see. Consumers' desire for inconspicuous luxuries was measured via the search volume for luxury hotels (Hilton, Ritz-Carlton, Sheraton, InterContinental, Four Seasons, Hyatt, The Peninsula) and makeup brands (Estee Lauder, La Mer, la Prairie, Lancome, Shiseido, Sisley, SK-II). These are less conspicuous because they are more experiential and others cannot see/recognize the consumption of these brands by looking at the consumer. Consumers' desire for non-luxuries (baseline) was measured via search volume for standard fashion brands (Forever21, H&M, Muji, Onitsuka, Topshop, Uniqlo, Zara).

From Google Trends, we collected weekly/monthly search volumes for the groups of brands across more than a decade (2004-2016/2019). We constructed time series of the total search volume for each brand type in each country. We standardized the data for analysis and removed the seasonal component of the time series.

Results show that the search volume for conspicuous luxuries had been increasing up to the point of the natural disaster, when it started to significantly decrease, both in Japan (Δb=-7.72 volume/year, 95% CI [-10.40, -5.04]) and in the U.S. (Δb=-5.06 volume/year, 95% CI [-6.11, -4.01]).

For luxury hotels (inconspicuous luxuries), the slope of search volume did not change after the earthquake in Japan (Δb=0.46 volume/year, 95% CI [-0.81, 1.68]) and became significantly less steep after the hurricane in the U.S. (Δb=1.92 volume/year, 95% CI [1.34, 2.51]), but still in the same direction. For makeup brands (inconspicuous luxuries), the slope of search volume became steeper but in the same direction in Japan (Δb= -2.37 volume/year, 95% CI [-4.05, -0.68]) and started to (non-significantly) increase in the U.S. (Δb= 1.26 volume/year, 95% CI [-0.57, 3.08]). For non-luxury brands, the search volume was increasing both before and after the disaster in Japan, with no significant slope change ((Δb=1.18 volume/year, 95% CI [-0.76, 3.13]), and in the U.S., with a less steep but still positive slope (Δb=-2.43 volume/year, 95% CI [-3.54, -1.31]).

The results show that consumers' desire for conspicuous luxuries decreases significantly after natural disasters when compared with desire for inconspicuous luxuries or non-luxuries. For further examination, a causal impact analysis should be applied and more factors should be considered. To increase the generalizability of the results, we plan to expand the analyses to additional events, countries, and brands. It would also be interesting to investigate the distinction between "search" and "purchase intention". For example, what's the conversion rate from "search" to "purchase"?

How Donor's Regulatory Focus Changes the Effectiveness of a Sadness-Evoking Charity Appeal

Jungsil Choi, Cleveland State University, USA
Hyun Young Park, CEIBS, China

EXTENDED ABSTRACT

Despite the prevalent use of sadness appeals in charity ads, past research offers inconsistent findings on whether sadness appeals motivate or demotivate charitable giving (e.g., Oveis et al. 2010; Pancer et al. 1979a, 1979b; Pancer 1988; Piff et al. 2010; Seu and Orgad 2014; Small and Vorrochi 2009). To reconcile these findings, we introduce prospective donors' regulatory focus as a moderator for understanding when and why sadness appeals motivate or discourage giving. Specifically, we propose that the sense of low personal control associated with sadness appeals (Garg and Lerner 2013) increases donors' sensitivity to advertiser's manipulative persuasion tactics, as those tactics can threaten donors' control over their donation decision. To maintain their control, persuasion knowledge is activated among prevention-oriented donors who tend to be vigilant against losses (Kirmani and Zhu 2007). Consequently, compared to promotion-oriented donors, prevention-oriented donors experience greater skepticism against a sadness appeal, while feelings less sympathy for the charitable cause, which as a result reduces charitable giving. In contrast, when a charity appeal induces an emotion whose cognitive appraisals are not associated with a low personal control (e.g., happiness or guilt), regulatory focus is less likely to influence skepticism, sympathy, and charitable giving.

We tested our predictions in six main studies and two supplementary studies. Study 1 demonstrated the impact of donors' regulatory focus on a real donation behavior. Participants ($n = 247$; MTurk) were assigned to view a charity advert that adopted one of the two emotion appeals (sadness vs. happiness) and indicated the amount they were willing to donate out of $1 bonus payment. Afterwards, their chronic regulatory focus was measured (Higgins et al. 2001). We found that a prevention focus decreased the donated amount compared to a promotion focus when a sadness appeal was used to solicit the donation, whereas regulatory focus did not affect the amount when a happiness appeal was used. Two supplementary studies ($n = 111$, undergraduate students; $n = 119$, MTurk) replicated these effects using different ads while regulatory focus was primed, instead of being measured, in one of those studies.

Study 2 compared sadness with guilt, to show that the decreased donation under a prevention focus is a unique response toward a sadness appeal, rather than a general response towards any negative emotion appeals. Participants ($n = 527$, MTurk) were randomly assigned to view one of the three emotion appeals (sadness, guilt, or happiness) and then indicated the amount they wished to donate out of hypothetical $100. Next, their chronic regulatory focus was measured. Although guilt is associated with an appraisal of a negative outcome (similar to sadness), the control over the outcome is still with the self (i.e., an appraisal of high personal control; Smith and Ellesworth 1985; Weiner et al. 1982). Accordingly, we expected that guilt appeals (vs. sadness appeals) are less likely to increase sensitivity to sources that pose threat to donor's control (i.e., manipulative tactics) and thus are less likely to activate persuasion knowledge among prevention (vs. promotion) oriented donors who tend to be vigilant against such potential threats. Consistent with our expectation, we found that a prevention (vs. promotion) focus decreased donation amount uniquely for the sadness appeal, and not for the guilt or happiness appeal.

Study 3 examined the causal chain of psychological mechanism underlying our effect. After assigning participants ($n = 134$, MTurk) to either a sadness appeal or a happiness appeal condition, participants reported their donation intention, skepticism towards the appeal, and sympathy. Their chronic regulatory focus was also measured. We conducted a moderated serial mediation analysis (Blanchard et al. 2016; Hayes 2015, PROCESS model 6) and found that a prevention (vs. promotion) focus activated persuasion knowledge against a sadness appeal that increased skepticism, which in turn disrupted the feelings of sympathy and demotivated giving; but this multi-chain mediation was not observed in the happiness appeal condition.

Studies 4 and 5 substantiated this mechanism by demonstrating the boundary conditions of our effect. In study 4, participants ($n = 241$, MTurk) were randomly assigned to one of the two cognitive capacity conditions (low vs. high), which was manipulated through a memory rehearsal task (Wegner et al. 1993; Yost and Weary 1996). After completing the task, all participants saw a sadness appeal and specified the amount (out of $10 lottery winnings) they were willing to pre-commit to the featured charity. Next, their chronic regulatory focus was measured. We found that constraining participants' cognitive capacity deactivated their persuasion knowledge, and as a result, regulatory focus no longer affected charitable giving even when the donation was solicited using a sadness appeal.

Study 5 ($n = 393$; MTurk) adopted a 2 (primed regulatory focus: promotion vs. prevention) x 2 (emotion appeal: sadness vs. happiness) x 2 (charity reliability: low vs. high) between-subjects design and demonstrated that persuasion knowledge against a sad charity appeal can be attenuated when the charity has a reputation as a reliable organization. Specifically, we conducted a moderated serial mediation analysis (with two moderators: W_1 = emotion appeal, W_2 = charity reliability) and find that skepticism (M1) and sympathy (M2) mediated the effect of regulatory focus on charitable giving only when the sadness appeal was used by a low reliability charity. When a charity is perceived to be reliable, participants' regulatory focus does not affect donor skepticism, feelings of sympathy, and charitable giving even when a sadness appeal is used to solicit the donation.

Finally, study 6 ($n = 234$, undergraduate students) validated the practical utility of understanding regulatory focus as a moderator for the effect of sadness appeal on charitable giving. Using an observable variable highly correlated with donors' regulatory orientation (i.e., cultural differences; Lee et al. 2000), we show that a sadness appeal demotivates giving among donors from an Eastern culture who tend to be prevention-oriented, compared to donors from a Western culture who tend to be promotion-oriented. The results highlight the importance of segmenting prospective donors based on observable donor characteristics correlated with regulatory focus when utilizing a sadness appeal to solicit a donation.

Justified by Ideology: Why Conservatives Care Less About Corporate Social Irresponsibility

Fabian Christandl, Hochschule Fresenius - University of Applied Sciences Cologne, Germany
Anna Jasinenko, HHL - Leipzig Graduate School of Management, Germany
Timo Meynhardt, HHL - Leipzig Graduate School of Management, Germany

EXTENDED ABSTRACT

With growing political polarization, political ideology becomes increasingly important when trying to gain a deeper understanding of consumers and their motivations (e.g., Jost, 2017; Jost, Langer, and Singh, 2017). Recent studies imply that political conservatism predicts consumers' differences, for example, in brand preferences (Khan, Misra, and Singh, 2013), luxury consumption motivation (Kim, Park, and Dubois, 2018), consumer differentiation preferences (Ordabayeva and Fernandes, 2018), variety seeking (Fernandes and Mandel, 2014), anti-counterfeit ad influence (Septianto, Northey, and Dolan, 2019), financial risk-taking (Han, Jung, Mittal, Zyung, and Adam, 2019) and complaining behaviors (Jung, Garbarino, Briley, and Wynhausen, 2017). In the current research, we are interested in the impact of conservatism on consumers' corporate social responsibility (CSR) perceptions and reactions.

Building upon political psychology (Jost, 2017), motivated social cognition approaches (Jost, Glaser, Kruglanski, and Sulloway, 2003) and system justification theory (Jost, Banaji, and Nosek, 2004), we propose that conservatives indulge in a relatively high security-motivated social cognition and, therefore, justify the market system with all its irresponsible processes and outcomes, including irresponsible business behavior. Accordingly, we expect that conservatives perceive the CSR of irresponsible companies to be higher than liberals do and, in turn, are less motivated to penalize them. Moreover, we expect this justifying effect to be weaker when consumers evaluate rather responsible versus rather irresponsible companies. This reasoning is based on the finding that system justification translates mainly into the justification of system-threatening (i.e., irresponsible business behavior) but not system-supporting (i.e., responsible business behavior) aspects.

Study 1 tests whether MSJ mediates the effect of conservatism on the CSR perception of irresponsible companies. For this purpose, we conduct an online survey in Germany that was part of the Public Value Atlas project (Public Value Atlas, 2019). Our sample consists of 2,476 participants with at least 258 participants per company. The age of participants is between 18 and 88 (M=50.67, SD=17.3), and 54% are male. We allocate political party affiliation to conservatism based on the right-left and market-state (same results) allocation of German political parties by Decker (2018). Participants had to rate at least one of 12 companies, that were preselected based on media reports and international consumer websites for ethical consumption. As measure of CSR perception, participants answered four public value items (Meynhardt, 2009; α≥.83). Next, participants completed the fair market ideology short scale (Jost, Blount, et al., 2003; α=.77, which measures consumers' MSJ tendency. In line with our conceptual model, the overall estimate of the mediation effect of MSJ on the effect of conservatism on CSR perception of rather irresponsible companies (see table) corroborates that, owing to a stronger MSJ, conservatives perceive rather irresponsible organizations to be more socially responsible than their liberal counterparts do.

Study 2 aims at replicating this finding in another country (Switzerland) to test the robustness and generalizability of the effect to other cultures and political systems. Moreover, we investigate whether this ideologically influenced difference in CSR perception, in turn, affects consumers' reactions to irresponsible companies.

The final sample consists of 826 participants aged between 18 and 89 (M=49.66, SD=17.90), 52.2% of whom are female. For all three company cases, MSJ mediates the effect of consumers' conservatism on CSR perceptions of irresponsible companies, thus corroborating the findings from study 1. In addition, it shows for all three company cases that MSJ (M1) and consumers' CSR perceptions (M2) sequentially mediate the negative effect of conservatism on consumers' penalizing reactions to low CSR, thus corroborating the proposed relationships from our conceptual model (see table).

Study 3 aimed at testing the full conceptual model, which hypothesizes that MSJ and CSR perception sequentially mediate the effect of conservatism on consumers' reactions more strongly for irresponsible companies than for responsible companies. Moreover, Study 3 aimed at testing the robustness of our findings from the previous studies regarding irresponsible companies by using additional measures for our main variables. The study used a convenience sample of 168 German consumers, aged between 18 and 59 (M=27.04, SD=6.08), of whom 64.9% are female.). Participants indicated the perceived CSR of each of the three presented companies as measured by public value (α≥.79). As an alternative measure of CSR perception, we include a CSR scale (Currás-Pérez, Bigné-Alcañiz, and Alvarado-Herrera, 2009; α≥.91). Next, participants indicated the past consumption frequency of each company's products or services (α≥.78) and intention to penalize or reward each company (α≥.77). The questionnaire continued with the full fair market ideology scale to measure MSJ (α=.85). Next, participants indicated their conservatism by evaluating ideologically laden claims (Roberts, 1996; α=.71). We tested the proposed relationships with a moderated sequential mediation analysis (Hayes, 2018; Model 91), which accounts for the complete conceptual model. Overall, the pattern of results (see table) corroborates our full conceptual model.

Study 4 aimed at testing the full conceptual model and addressed a number of unsolved issues from previous studies. First, the mediator MSJ is contrasted to other forms of system justification in order to test whether MSJ in fact provides the best fitting form of system justification underlying the conservatism-CSR perception relationship. Second, we aim to control for company-specific confounders by looking at just one company and experimentally manipulating the overall CSR performance of this specific company. Third, we add consumers' boycotting intentions as an additional form of expected penalizing reactions to low CSR to address a broader range of consumer reactions. The sample consists of 149 German consumers, aged between 18 and 59 (M=29.07, SD=7.98), 45% female, who were recruited via Prolific. First, the results of a parallel mediation analysis show that MSJ remains the only significant mediator among the four system justification scales. Second, we replicate the moderated sequential mediation analysis from Study 3, which accounts for our complete conceptual model. The pattern of results corroborates our conceptual model for different measures used as mediators and DVs.

Future research could delve deeper into the question of whether the conservatism effect equally accounts for every type of CSR. From a managerial perspective, the findings from our research could help to address different segments of consumers more appropriately when dealing with CSR.

Larger Screen, Inaccurate Perceptions: Investigating Visual Framing Effects on Online Shoppers' Product-Size Estimation

Sorim Chung, Rochester Institute of Technology, USA
Maria Karampela, University of Strathclyde, Scotland

EXTENDED ABSTRACT

Incorrect size is often a principal reason behind e-commerce returns. This research investigates the visual framing effects of screen size on e-shoppers' accuracy of product-size estimations. Three experiments reveal the mechanism behind screen size effects and inform practical recommendations about optimization of e-retailers' websites.

Introduction

As size issues are a common complaint for returns of online purchases (Reagan 2019), accurate product-size evaluations emerge as a key challenge for consumers and retailers, particularly as consumers nowadays use various devices for online shopping. We believe that the size of consumers' digital space, which varies by device type, may influence their accurate product-size estimations. However, screen-size research on the accuracy of online shoppers' visual information processing remains scant. Screen-size effects have been studied mostly in non-e-commerce environments, where a larger screen has been shown to positively influence consumers' emotional responses toward TV clips (Lombard et al. 2000; Reeves et al. 1999) and advertisements (Kim and Sundar 2016). In three experiments, we examine the impact of screen size on consumers' product attitudes, confidence, and product-size estimation errors, in e-commerce settings.

Theoretical Background & Hypotheses

According to visual frame theories (Künnapas 1955; 1959), the larger a square-shaped frame surrounding an object is, the shorter and thinner the object is perceived to be (Künnapas 1955). As a computer screen may work as a visual frame, we propose instead that larger-screen (e.g., PC) users perceive products to be larger than small-screen (e.g., smartphone) users (**H1**), as most websites tend to proportion the size of product images automatically.

Larger screens induce higher levels of excitement (Lombard et al. 2000) and arousal (Reeves et al. 1999) when viewing TV content. Similarly, online shopping using a large screen may lead to more positive product attitudes (**H2a**). We also expect that hedonic motivations (vs. utilitarian) strengthen the positive screen-size effects on attitudes (**H2b**) because hedonic-driven shopping experiences are perceived more positively (Childers et al. 2001; van Noort et al. 2012). As a larger screen leads to more positive affect in non-ecommerce settings (e.g., Lombard et al. 2000), large-screen users may pay less attention to product details, resulting in less accurate estimations (**H3a**), and this heuristic, rather than cognitive, effect may be stronger with hedonic shopping motivations (**H3b**).

Furthermore, a larger display holds more information (Dilon et al. 1990), making it easier to review lengthy product specifications, which may increase consumers' confidence about their decisions (Wang et al. 2015), as does product fluency (Deng et al. 2016; Tsai and McGill 2011). Therefore, in online shopping, a large screen may increase confidence about product size (**H4a**), and familiarity with products may strengthen the effects of screen size on the accuracy of product-size estimations (**H4b**). Finally, we propose that large-screen users' positive product attitudes and stronger confidence about the product size mediate the impact of screen size on product-size estimations, resulting in less accurate product-size estimation (**H5**).

Experiment 1: Basic Size Estimation

Experiment 1 involved a one-way between-subjects design (small 14"/large 22" screen), with 93 individuals (49.5% women; 83% aged 18–24). To test base effects, participants estimated sizes (in inches) for an identical set of basic black-colored shapes (rectangle, oval, triangle, line) and indeed perceived them all to be longer in the large screen condition ($F(1, 92)=22.37$, $p<.0001$), confirming H1.

Experiment 2: Product Familiarity

To examine screen-size effects when evaluating product sizes, we used a 2 (screen size: small/large)×2 (product familiarity: familiar/unfamiliar) between-subjects design, with 150 individuals (42% women; 37% aged 25–34). The product familiarity manipulation was successful ($p<.0001$). Large-screen users were less accurate only in unfamiliar conditions ($p=.024$), supporting H4b. They were also more confident about their estimations ($F(1, 146)=25.20$, $p<.0001$), supporting H4a, in both familiar ($p<.001$) and unfamiliar conditions ($p=.01$). The mediation analysis (PROCESS; model 6;10,000 bootstrap samples; Hayes 2018) showed a significant serial mediation effect ($b=.45$, CI 95% [.002, 1.25]) of attitudes and confidence between screen size and product-size estimation, supporting H5.

Experiment 3: Shopping Motivations

To test the role of shopping motivations, we used a 2 (screen size: large/small)×2 (shopping motivation: hedonic/utilitarian) between-subjects design with 169 individuals (53.3% women; 48% aged 35-44). The manipulation was successful; the hedonic condition found the task more fun (p=.008). Large-screen users displayed more positive attitudes ($F(1, 165)=11.28$, $p=.001$), and even more so with a hedonic motivation ($p=001$), supporting H2a and H2b. Large-screen users made less accurate product-size estimations ($F(1, 165)=7.95$, $p=.005$); this was significant in hedonic conditions only ($p<.003$), supporting H3a and H3b. Large-screen users also felt more confident about their estimations ($F(1, 165)=20.72$, $p<.001$) in both hedonic ($p<.001$) and utilitarian conditions ($p=.018$), supporting H4a. The proposed serial-mediation analysis (PROCESS; model 6;10,000 bootstrap samples; Hayes 2018) was not significant.

General Discussion And Implications

Overall, this research introduces screen sizes as online retail cues that influence the accuracy of product-size evaluations in e-commerce. Larger screens led to more positive attitudes, stronger confidence, and less accurate size estimations. Moreover, our findings are also in line with the previous findings on the positive associations between screen size and emotional responses in non-e-commerce settings (e.g., Chae and Kim 2004; Lombard et al. 1997; Kim and Sundar 2014, 2016).

The findings highlight that screen size functions like a visual sensory cue, influencing customers' emotional status and ultimately product evaluations. Businesses should improve the experience of consumers using smaller screens by providing tools to improve their confidence. Providing more videos may enable businesses to better promote products to small-screen users while advanced technologies

(e.g. AR) may also help businesses in reducing negative screen-size effects and increasing consumer confidence.

Future research may want to examine visual framing effects on different visual measures such as volume estimation, whether such screen size effects are consistent in VR/AR environments, and whether they have spill-over effects on offline product evaluations.

A Bird in the Hand is Yours:
The Relationship Between Psychological Ownership and Psychological Distance

Bart Claus, IESEG School of Management, France
Jiska Eelen, Vrije Universiteit Amsterdam, The Netherlands
Luk Warlop, BI Norwegian Business School, Norway

EXTENDED ABSTRACT

Ownership largely determines the house and bed we pick to sleep in, whether we take a car, bike, or taxi to work, and what kind of coffee we drink. As ownership organizes our attention (Ashby, Dickert, and Glockner 2012; Turk et al. 2011) and memory (Cunningham et al. 2008; van den Bos et al. 2010), it is critical that what drives these effects is not legal ownership but the perception and psychological *experience* of ownership (Carmon, Wertenbroch, and Zeelenberg 2003; Morewedge and Giblin 2015; Morewedge et al. 2009). Psychological possessions are included in the extended self as concentric layers around the core self, ordered according to their centrality (Belk (1988). Varying degrees of psychological ownership correspond to varying positions of the ownership target on these concentric layers, each with its distance from the core self. Combining this distance with the referent position of the self, we propose that a schematic match exists between the cognition of ownership and that of psychological distance.

Psychological distance is the subjective remoteness of an experienced stimulus (Amit, Algom, and Trope 2009). As with ownership, the self is a central reference point. Research has identified four dimensions of psychological distance from a target to the self: time (Liberman, Sagristano, and Trope 2002; Liberman and Trope 1998), probability (Wakslak et al. 2006), spatial distance, and social distance (Fujita et al. 2006; Liberman and Trope 2008). By definition, the self is psychologically close (Malär et al. 2011). We propose that possessions as extensions of the self can be mapped on psychological distance, and that ownership itself is associated with psychological proximity. Four studies test this prediction.

Study 1 applied a scenario based on a road trip with a rented car, we find that participants who feel greater ownership of the car also feel closer to the location ($r = .47$, $p < .001$), feel that the trip is closer in time ($r = .42$, $p < .001$), and feel that the trip is more certain to take place ($r = .36$, $p < .001$). Based on control measures, we conclude that effort and ease of retrieval are unlikely explanations of these results.

Study 2 used an implicit association test (IAT) (Greenwald, McGhee, and Schwartz 1998; Greenwald, Nosek, and Banaji 2003) to assess the implicit association between words related to ownership (vs. non-ownership) and words related to proximity (vs. remoteness) for each psychological distance dimension. We found significantly positive D-biep scores for the association between ownership and spatial proximity ($D = .81$, $SD = .33$, $n = 38$; $t(37) = 17.97$, $p < .001$), probability ($D = .78$, $SD = .27$, $n = 35$; $t(34) = 17.17$, $p < .001$), social proximity ($D = 1.051$, $SD = .31$, $n = 33$; $t(32) = 19.48$, $p < .001$), and temporal proximity ($D = .73$, $SD = .31$, $n = 31$; $t(30) = 12.98$, $p < .001$). This result indicate a stronger implicit association between ownership and psychological proximity than between ownership and remoteness, with the reverse true for non-ownership.

For study 3, we focused more on a marketing practitioner point of view. Several marketing variables (delivery time, procurement, purchase risk, social proof) can be thought of as mapping on psychological distance dimensions. Studies 3A and 3B investigate whether temporal and spatial distance can affect ownership in a retail context.

Study 3.A focused on time. Participants were asked to choose their preferred lamp from a list of twelve – each with picture and description – as if they were considering buying it (Peck, Barger, and Webb 2013). In the close time condition, information was added that the lamp would be delivered the next day. In the distant time condition, the lamp would be delivered 11 days later. Controlling for attractiveness, a planned comparison for close time versus far time indicated that a closer delivery time yielded more ownership ($M = 5.00$, $SD = 1.82$, $n = 42$) than when delivery was further in the future ($M = 4.26$, $SD = 2.00$, $n = 42$; $t(116) = 1.94$, $p = .055$, Cohen's $d = .42$). The baseline condition yielded ownership levels between those of the close and the far condition ($M = 4,77$, $SD = 1.94$, $n = 48$).

Study 3.B focused on physical distance, and used a scenario similar to the one in Study 3A. A lamp found in a web shop from a store close to home yielded more ownership ($M = 4.42$, $SD = 1.91$, $n = 38$) than when the store and lamp were located at the US Coast opposite to where participants were closest ($M = 3.42$, $SD = 2.42$, $n = 31$ $t(113) = 2.37$, $p < .05$, Cohen's $d = .57$). While the contrast between the baseline condition and the close space condition was not significant, the far condition seemed to reduce ownership compared to the baseline condition ($t(113) = 1.90$, $p = .06$, Cohen's $d = .44$). In line with literature (Liberman and Trope 2008), participants apparently assume proximity when evaluating products without information to the contrary (e.g., delivery times or shipping locations).

General Discussion

Our findings extend the egocentric categorization model of ownership. The idea that possessions are included in the (extended) self (Belk 1988; Weiss and Johar 2013) is one of the most influential ideas in consumer research literature. While the egocentric categorization model of ownership discussed similarities between ownership and social categorization (Weiss and Johar 2013), we now show that ownership is more generally associated with various dimensions (space, time, probability, sociality) of psychological distance, adding to the operational meaning of the extended self (Cohen 1989).

Our causal paradigm highlights an intrinsic challenge for contemporary online and on-demand retailing that necessarily comprises psychological remoteness. Increasingly, items are not available for physical inspection (are physically remote). They cannot be received immediately (are temporally remote) and are chosen on the basis of strangers' ratings instead of friends' advice (are socially remote). Our studies indicate that relying on proximity cues can to some extent attenuate these intrinsic challenges of contemporary retailing.

Followers and the Impact of Social Media Influencers: A Construal Level Perspective

Kirsten Cowan, University of Edinburgh, Scotland
Eric Boyd, University of Edinburgh, Scotland

EXTENDED ABSTRACT

Managing brands is a critical aspect of marketing, more so for marketers using social media influencers (SMIs). A SMI is a person possessing a loyal following to content they create and share online (Bailis 2019). Voorveld (2019) and others have challenged researchers to identify what makes SMIs effective. Recent research has primarily taken a power perspective. For instance, Kupfer et al. (2018) emphasize the expert and referent-based power a SMI on social media. Specifically, Kupfer et a;. (2018) find that SMIs who promote composite brands are more persuasive when they have high power (i.e. have more followers) because consumers can satisfy their desire to be close to a SMI with the composite brand product involving the SMI. Contrary to this research, we argue that recommendations to use brand with a larger SMI following is not always the most effective strategy. Rather, in a single brand context no involving a SMI, we argue that the SMI with lower (vs. higher) followers can be more persuasive in certain cases. We aim to respond to the following research questions. Under which conditions are SMIs with fewer (vs. higher) followers more persuasive? Does consumers' perceived connection to the brand mediate?

Drawing from construal level theory, we argue that the perceived social distance between the consumer and the SMI is based on the number of followers in a single brand situation not involving a SMI's brand. When SMIs have a higher (lower) following, greater (less) social distance should be perceived, which should result in consumers experiencing an abstract (concrete) mindset. The effectiveness of a SMI is then argued to depend upon matching the diagnosticity of information in the decision-context with the consumer's construal mindset evoked by the SMI's number of followers.

We also argue that self-brand connection, reflecting the extent consumers integrate the brand into their sense of self (Escalas 2004), mediates the effect of the construal matchup on brand responses. Kupfer et al. (2018) propose that a SMI's number of followers increases their power base and strengthens the identification people feel towards a composite brand. We focus on single brand situations and argue that it is the construal matching that facilitates feelings of brand identification, and can occur for SMIs with fewer followers, as long as the information in the context is more diagnostic.

Study 1, using field data on Instagram, examines likes to SMI posts. Diagnosticity is facilitated by attribute-level information like brand tagging, which is heuristic (e.g. Kelting et al. 2019). The quasi-experiment mixed design included one between-subjects factor (SMI following: low vs. high) and one within-subjects factor (brand: tagged vs. untagged). Contrasts for the low (high) follower SMIs showed that tagged (untagged) were more liked, supporting a match-up effect between SMI following and information diagnosticity.

Study 1 integrates media diagnosticity (e.g. Colicv et al. 2018), where earned (vs. owned) media is more diagnostic. Additionally, we rule out credibility as an alternative explanation. A between subjects experiment included two manipulated factors: media (owned vs. earned) and SMI following (low vs. high). Respondents viewed one of four posts and responded to purchase intentions and covariates (e.g. product involvement and SMI familiarity). A MANCOVA with the source characteristics yielded no significant main effects or interactions. A 2-way ANCOVA examining purchase intentions ($F(1, 209) = 7.75$; $p < .01$) revealed that the SMI with the high (low) following had higher purchase intentions when appearing on owned (earned) media. This study extends construal match up to the channel and reports no differences in credibility.

The goal of study 2 is to provide more robust evidence with a more (vs. less) innovative products to match construal (e.g. Alexander et al., 2008). An experimental study manipulated product innovativeness (low vs. high) and SMI following (low vs. high). Participants indicated their purchase intentions, followed by the same covariates. The 2-way ANCOVA on purchase intentions ($F(1,157) = 5.09$; $p < .03$) was significant. For the SMI with low following, purchase intentions were higher when product innovativeness was low (vs. high). Interestingly, the SMI with more followers did not gain persuasiveness with high product innovativeness, indicating an ordering of effects.

In study 3, we created a fictitious SMI and posts, holding earned media constant, and examining self-brand connection as a mediator. A between-subjects experiment manipulated SMI following (low vs. high) and brand tagging (present vs. absent). Respondents viewed one post and indicated their purchase intentions, self-brand connection, and covariates. A 2-way ANCOVA on purchase intentions ($F(1, 154) = 12.62$; $p = .001$) suggested that for the low (high) power SMI, purchase intentions were higher when the brand was tagged (untagged). PROCESS Model 8 provided support for self-brand connection as a partial mediator for purchase intentions. This final study demonstrates that in the presence of the matchup, consumers feel more connected to the brand, which then facilitates positive consumer responses.

Overall, a field study and three experiments supported the novel theoretical framework focusing on construal level theory. Furthermore, the research offers a new mediator to CL matching, that of self-brand connection. These results make several contributions. First, we introduce construal level theory as a valuable theoretical framework to understand the impact of SMI following. Contrary to Kupfer et al. (2018), we document instances where a SMI with high power may be less helpful for branding. Second, we provide early evidence of the differential impact of different media channels in the construal matching effect. Third, we identify a new mechanism underlying the construal level matchup- self-brand connection. Several recommendations are offered for marketing managers who use SMIs.

Consumers Respond to Artificial Intelligence Recommendations: Experiential vs. Material Framing

Nadia Danienta, University of Illinois at Urbana-Champaign, USA
Aric Rindfleisch, University of Illinois at Urbana-Champaign, USA

EXTENDED ABSTRACT

Artificial intelligence (AI), powered by algorithms, has begun to transform the way consumers shop (Kahn, Inman, and Verhoef, 2018). The use of AI as a shopping tool is projected to grow rapidly as the computers and software that enable their algorithms are getting smarter, faster, and cheaper (Bohn, 2019). Thus, understanding how consumers respond to AI recommendations is an important issue for both research and practice.

Although algorithms outperform humans, people are reluctant to rely on algorithm's due to "algorithm aversion," which makes individuals less likely to comply with its recommendations, leading to suboptimal outcomes (Dzindolet et al., 2002; Beck et al., 2011; Dietvorst, Simmons, & Massey, 2015; Dietvorst, Simmons, & Massey, 2016; Yeomans et al., 2017; Bonaccio & Dalal, 2006; Yaniv & Kleinberger, 2000; Yaniv, 2004).

A handful of empirical experiments have examined people's aversion toward AI due to an absence of the sense of self. In subjective domains governed by personal taste, participants relied on friends over recommender systems for book, movie, and joke recommendations (Sinha & Swearingen, 2001; Yeomans, Shah, Mullainathan, & Kleinberg, 2017). After seeing an algorithm err, people relied more on themselves than the algorithm, (Dietvorst et al., 2015; Dzindolet, Pierce, Beck, & Dawe, 2002). Therefore, offerings with a greater degree of connection to the self should allow consumers to overcome algorithm aversion. Our research takes a different approach, instead of changing perceptions of AI, we focus on changing perceptions of the purchase experience itself in relation to one's self.

Prior research suggests that consumers regard recommendations made by AI as externally generated and thus, are unlikely to regard these recommendations as attributable to the self (Schmitt 2019). As a result, these recommendations may threaten consumer identity and sense of agency (Leung et al., 2018; Longoni, Bonezzi, & Morewedge 2019). However, previous research on experiential consumption finds that experiences enhance consumers' sense of self-connection because they reveal insights to their true selves (Carter & Gilovich, 2012; Kim et al., 2016). Experiences become part of our autobiographical memory and become part of who we are as individuals. Using real-world AI interfaces, we find that AI assistance lowers evaluations for material purchases (study 1), but increases evaluations for experiential purchases (study 2). Underlying this AI effect is an enhanced self-connection, even when the same purchase (book subscription service) is framed experientially versus materially (study 3).

In study 1, 129 undergraduates (50.4% female; M_{age} = 20.33 years, SD = 1.33) from an American university were randomly assigned to conditions: control vs. AI. First, all participants imagined that they planned to purchase a rain jacket from The North Face brand. Control participants were asked to search online on The North Face website to select a rain jacket (https://www.thenorthface.com/). In the AI condition, used AI technology (https://www.thenorthface.com/xps). The AI narrowed their search results, but participants still chose among those options similar to the control. Afterward, participants evaluated the material purchase on 7-point scales (good, appeal, desire, favorable). As predicted there was a main effect of condition on mean rain jacket evaluations ($F(1, 127)$ = 8.44, p = .004) where participants lowered their evaluations of the rain jacket in the AI-assisted condition (M_{AI} = 4.62) compared to the control condition ($M_{control}$ = 5.27).

In study 2, 136 undergraduates (51.5% female; M_{age} = 20.37 years, SD = 1.34) were randomly assigned to conditions: control vs. AI. In all conditions, participants imagined that they planned to purchase movie tickets and were seeking out more information (i.e. the closest movie theaters, etc.), which was standardized. Control participants read information on the computer in order to answer specific questions. In contrast, participants in the AI condition asked Alexa the same questions using an Amazon Echo Dot in the laboratory, then evaluated the movie. Finally, we examined participants' sense of self-connection (2-item measure) with the movie.

As predicted, we found a main effect of condition on mean movie evaluations ($F(1, 134)$ = 4.26, p = .040) where participants increased their evaluations in the AI-assisted condition (M_{AI} = 4.60) compared to the control condition ($M_{control}$ = 4.25). AI predicted a sense of self-connection with the movie (b = .53, SE = .26, $t(134)$ = 2.08, p = .039), which in turn predicted movie evaluations (b = .29, β_{exp} = 3.51, p = .014). Bootstrapping analysis with 5,000 samples suggested that the conditional indirect effect of AI on movie evaluations via a sense of self-connection was positive and significant with a 95% confidence interval that did not include zero (a x b = 0.15; SE = .078; 95% CI: .017 - .32).

In study 3, we framed the same book subscription service as a material or experiential purchase and manipulated the origin of the recommendations (human vs. AI). We randomly assigned 177 MTurk participants (51.4% female; M_{age} = 38.26 years, SD = 20.42) in a 2 (recommender: human vs. AI) x 2 (purchase frame: material vs. experiential) design. Participants either read a description that emphasized how the books would look on their bookshelf (material frame) or the experience of reading the books (experiential frame; Rosenzweig & Gilovich, 2012). Next, participants indicated their preferences (i.e. genre, book length, etc.). Then, participants either read that a human or AI generated the same book recommendations. Finally, the books were evaluated.

Results revealed a significant interaction on mean book evaluations ($F(1, 173)$ = 5.62, p = .019). When the books were recommended by an AI, evaluations were significantly higher in the experiential frame condition ($M_{experiential}$ = 4.00) compared to the material frame condition ($M_{material}$ = 3.33; $F(1, 173)$ = 7.93, p = .046). However, there was no effect of framing when the books were recommended by a human ($F < 1$). Bootstrapping analyses indicated that the mediating effect of self-connection was significant when the purchase was framed as an experience.

In sum, AI assistance lowers evaluations for material purchases, but increases evaluations for experiential purchases because of an enhanced sense of self-connection. Framing purchases as experiences serves as an inexpensive strategy to enhance recommendations from algorithms.

Insights into the Black Box: Input Explainability of
Algorithmic Decisions Drives Consumer Satisfaction in the Digital World

Ipek Demirdag, University of California Los Angeles, USA
Suzanne Shu, University of California Los Angeles, USA

EXTENDED ABSTRACT

It has been long acknowledged that computational prediction procedures may yield more accurate predictions than human judges (Dawes 1979; Meehl 1954). Nevertheless, people are often algorithm averse, that is, they are less willing to rely on algorithms than humans in tasks such as forecasting (Dietvorst, Simmons, and Massey 2015). Previous research on algorithm aversion has largely examined algorithmic *forecasts* or *recommenders* and not algorithmic *decisions*. This paper explores an uninvestigated facet of algorithm aversion: consumer attitudes and behavior regarding decisions that algorithms make on their behalf.

We explore consumers' conceptualizations of human and algorithmic decision processes. We suggest that consumers perceive algorithms as *black boxes*, but they perceive their own decision processes as more transparent. This distinction drives algorithm aversion for decision-making. Specifically, we propose that lower *perceived process transparency* (i.e., a decision characteristic whereby a decision process is perceived to be understood) explains the lower trust in and preference against algorithmic decision-makers relative to human (either self or other) decision-makers. Importantly, we test whether *input explainability* (i.e., the consumer's ability to know relevant input information regarding a decision) increases perceived process transparency and trust, leading to higher satisfaction with the decisions made in the digital world.

Study 1: Does Process Transparency Explain Preferences For Self Choice Over Algorithmic Choice?

The experiment involved a 2 (Choice Type: Self Choice (SC), Algorithmic Choice (AC)) x 3 (Choice Context: AirBnB, Vending Machine, Uber) between-subjects design, in which participants (N = 957) were randomly assigned to one of six conditions.

There was a significant main effect of choice type on process transparency: Self Choice participants thought their decision was more process transparent than Algorithmic Choice participants ($F(1, 955) = 150.70$, $p < .001$). Self (vs. Algorithmic) Choice participants trusted their (vs. algorithm's) decisions more ($F(1, 955) = 136.20$, $p < .001$) and were more satisfied ($F(1, 955) = 23.90$, $p < .001$).

A serial mediation analysis uncovered an indirect effect of the algorithmic (vs. self) choice on satisfaction through process transparency and trust, indirect effect = .055, 95% CI = [.041, .072]. This indicated that the effect of algorithmic choice on satisfaction is driven by lower trust in the algorithm, which result from people's belief that the algorithm's decision is less process transparent than one's own decisions.

Study 2: Input Explainability As A Way To Increase Process Transparency

Participants (N = 960) were randomly assigned in a 2 (Choice Type: SC, AC) x 2 (Explainability: Explainable (X), Unexplainable (UnX)) between-subjects design in a t-shirt shopping scenario.

SC (vs. AC) was more process transparent ($F(1, 958) = 11.55$, $p < .001$). SC was more satisfactory ($F(1, 958) = 22.22$, $p < .001$) and trustworthy ($F(1, 958) = 698.90$, $p < .001$) than AC. The number of other t-shirts looked at was greater for AC than for SC ($F(1, 958) = 26.14$, $p < .001$). SC and AC did not significantly differ on the predicted time looking at other t-shirts.

Explainable (vs. unexplainable) decisions were more process transparent ($F(1, 958) = 354.30$, $p < .001$), more satisfactory ($F(1, 958) = 57.12$, $p < .001$), and trustworthy ($F(1, 958) = 14.01$, $p < .001$). There was no difference on the predicted time looking at other t-shirts or the predicted number of other options looked at.

In a serial mediation analysis found that explainable (vs. unexplainable) decisions were more process transparent and, consequently, more trustworthy, resulting in higher satisfaction. The indirect effect was .10, with standard error .01 and 95% CI = [.073, .123].

Study 3: What About Other Humans' Choice?

Participants (N = 1083) were randomly assigned to one of twelve conditions following a 3 (Choice Type: SC, Other's Choice (OC), AC) x 2 (Explainability: Explainable, Unexplainable) x 2 (Choice Outcome: Sparing Self (SS), Sparing Pedestrian (SP)) between-subjects design.

All twelve conditions involved an inevitable car accident. SC participants imagined that they were driving their car. OC participants imagined that they were in an Uber. AC participants imagined that they were in a self-driving car. Explainable (vs. Unexplainable) participants read an explanation for the accident.

SC was rated more favorably than OC, which was rated more favorably than AC for process transparency, appropriateness, and trust. Algorithmic Choice was viewed as less acceptable and less fair than both Self Choice and Other's Choice. Explainable (vs. Unexplainable) decisions were more process transparent ($F(1, 1081) = 64.27$, $p < .001$), acceptable ($F(1, 1081) = 40.70$, $p < .001$), appropriate ($F(1, 1081) = 44.07$, $p < .001$), and trustworthy ($F(1, 1081) = 27.25$, $p < .001$).

In order to test the process whereby choice type, specifically OC versus AC, affects decision appropriateness via process transparency and trust, we conducted a serial mediation analysis. We found an indirect effect ($a_1*d_{21}*b_2$) of .06, with standard error .01, 95% CI = [.033, .083]. AC (vs. OC) was less process transparent ($a_1 = .31$, SE = .06, $p < .001$) and hence less trustworthy ($d_{21} = .32$, SE = .02, $p < .001$), leading to lower decision appropriateness ($b_2 = .55$, SE = .04, $p < .001$).

General Discussion

We find that input explainability increases process transparency and, thus, individuals' enjoyment of a decision, whether it is made by themselves, another human, or an algorithm. Explainability information conveyed to people shapes the perceived trustworthiness of the human or algorithmic decision-maker. Having the algorithmic decision-maker tell us why it has made a certain decision is essential, because otherwise we will not understand the processes behind such decisions, which reduces acceptance of algorithms.

While it is difficult for consumers to explain the reasoning behind every decision they make, they value explainability when it comes to self, other, or algorithmic choice. Bridging the gap between algorithmic decisions and people's understanding of those decisions through explainability can promote adoption and continued use of algorithms. Across three studies reported in this paper and three other completed studies that are not included here, our results suggest that digital platforms and automated systems should implement

techniques that enhance process transparency and trust via input explainability.

Mere Packaging and Consumer Choice: How Unnecessary Packaging Can Increase Product Value

Tim P. Doering, University of Michigan, USA
Katherine Burson, University of Michigan, USA
Andrew D. Gershoff, University of Texas at Austin, USA

EXTENDED ABSTRACT

Though packaging can benefit marketers and consumers (Kotler and Keller 2011), a large percentage is superfluous. Indeed, pilot participants believed packaging was mostly unnecessary (10 products, table 1). But packaging is one-third of household waste (US EPA 2015). We examine psychological barriers to abandoning unnecessary packaging - a "mere" packaging effect.

Packaging reduces contamination fears (Argo, Dahl, and Morales 2006; White et al. 2016), though not entirely (Castro, Morales, and Nowlis 2013; Morales and Fitzsimons 2007). We hypothesize that packaging preserves a product's essence. Products can acquire human (Newman, Diesendruck, and Bloom 2011; Smith, Newman, and Dhar 2016) or brand essence (Newman and Dhar 2014). Here we ask if essence can also be lost and whether packaging can mitigate this effect. Because consumers imagine that essence follows physical laws (Nemeroff and Rozin 2018), packaging might help to prevent its escape. Five experiments reveal a preference for "mere" packaging (studies 1a, 1b), that essential physical qualities are lost via unpackaging (studies 2, 3), and that packaging increases product value and purchase intention (study 4). Means for all studies are reported in table 1.

In study 1a (N = 172) and 1b (N = 141), participants stated their preference for a packaged (1a soccer ball, 1b USB stick) over an unpackaged product. Study 1a tested three conditions (product available unpackaged, unpackaged by customer, unpackaged by salesperson) and study 1b introduced a fourth condition where a salesperson had removed packaging before shelving. We find a mere packaging effect that is attenuated by participation in unpacking. An ANOVA showed that, given simply a choice between unpackaged and packaged balls, participants preferred a packaged ball more than in the other two conditions ($F(2, 169) = 10.52$, $p < .001$). For the USB stick, preference for a packaged product was greater if it was available packaged and unpackaged compared to when it was unpackaged at the point of purchase ($F(3, 137) = 16.82$, $p < .001$). Notably, there was no difference between participating in versus witnessing packaging removal.

Study 2 explored the reason for a preference for mere packaging. We hypothesize that mere packaging prevents escape of product essence. 193 participants rated the value and weight of 8 products from the pilot and all of its packaging. Half saw and rated the product inside the package and half next to the package but including it. Two individual difference measures, the Paranormal Belief Scale (Tobacyk and Wilkinson 1990) and Individual Differences in Anthropomorphism Questionnaire (Waytz, Cacioppo, and Epley 2014) did not interact with the condition variable and will not be discussed further. A linear mixed model (LMM) on value and weight revealed that products in packaging were perceived as heavier compared to products next to packaging ($z = 2.22$, $p = .026$). This pattern is consistent with a perception that essence is lost when packaging is removed, and this negatively impacts the product value.

Study 3 (N = 419) followed a 2 (between subjects: remained in packaging vs. removed and put back) x 2 (within subjects: measurement 1 and 2) study. Participants received a baseball in a transparent box and two bottles, one empty and one filled with 300g of sand. They poured sand from the full bottle into the empty bottle until the empty bottle felt equivalent to the weight of the baseball and its box. Half of participants then removed and replaced the ball from the box. After a delay, all participants repeated the sand-pouring exercise. An LMM on estimated weight revealed a significant effect of packaging ($z = 2.63$, $p = .01$). Participants estimated higher weight when the baseball remained in its packaging compared to when it was removed and put back in. Importantly, the predicted interaction of packaging and measurement was observed ($z = 2.30$, $p = .02$), suggesting essence is perceived as following physical laws. A product in unopened packaging was perceived as heavier than one in previously opened packaging.

Study 4 (N = 192) further explores the relationship between packaging, essence, and perceptions of weight. This study follows a 2 (text type: narrative vs. control) x 2 (packaging: present vs. absent) between subjects design. Narratives can imbue an object with essence (Gelman 2003). Participants were asked to imagine evaluating a wooden duck on eBay and indicated whether they would like to own, keep, or purchase the item. Following Newman (2018), these three measures were averaged into an "object valuation" measure ($\alpha = .69$). We also collected weight, essence, and intangible value. An ANOVA revealed that a narrative increased valuation ($F(1, 188) = 23.68$, $p < .001$) and intangible value ($F(1, 188) = 6.56$, $p = .011$) while packaging increased perceived weight ($F(1, 188) = 4.10$, $p = .044$), intangible value ($F(1, 188) = 7.97$, $p = .005$), and the amount of essence in the product ($F(1, 188) = 6.05$, $p = .015$). A mediation analysis (Model 4, Hayes 2017) further revealed a significant indirect effect of packaging on product valuation through perceived essence ($ab = 1.54$, 95% C.I. [.37, 3.13]). Study 4 showed that essence was always higher if a product was packaged.

While previous essence research was mainly concerned with the transfer of an outside essence into a product, our research suggests that essence can also be lost. We find a preference for a mere packaging: Consumers prefer a packaged product even when they believe packaging is unnecessary (study 1a, b). A packaged product is perceived as heavier compared to an unpackaged product and its packaging (study 2), even if it was just briefly removed (study 3). To the extent that it can contain essence, packaging can increase product valuation (study 4). Of course, essence loss is not the only potential driver of the devaluation of unpackaged products. This research paints a more complete picture of the psychological utility mere packaging provides as a bidirectional barrier, and a way to reduce consumer desire for it by giving them control over unpackaging a product.

Food Choices And Food Socialization By Lower-Income Chilean Mothers Following Major Legislation Changing Labelling Standards

Raquel Donskoy, Universidad Adolfo Ibáñez, Chile
Flavia Cardoso, Universidad Adolfo Ibáñez, Chile

EXTENDED ABSTRACT

In a context of a high and growing prevalence of overweight individuals and childhood obesity, Chile enacted Law 20,606 in 2016, with the goal of protecting children by encouraging informed food selection and less consumption of foods high in calories, saturated fats, sugar, and sodium (MINSAL, 2018). Law 20,606 mandates that food products exceeding the daily allowances for nutrients and calories recommended by the Ministry of Health must include a warning label indicating this on the front of the product. It also prohibits advertising these foods to children under the age of 14 and marketing or delivering these products free of charge to preschools or primary and middle schools, among other restrictions (MINSAL, 2018). The law was developed on the underlying assumption that consumers would improve their eating habits if they were better informed about the nutritional factors of their food choices (Araya, 2018; Cardello, 2018).

Considering that mothers play a fundamental role in food socialization in families (Epp and Price, 2008; Chytkova 2011; Epp and Velegaletti, 2014; Judd et al. 2014; Moore 2018), we conducted 16 in-depth, oral and semistructured interviews (Arsel 2017) with randomly selected working mothers from lower SEGs according to Chilean categorization (Activa Research 2017) and collected photos of their refrigerators and pantries (Gram, 2014). The photos were compared to the interview answers for validation because family nutrition is a sensitive subject and the mothers may hide or withhold the real answers to the researcher's questions (Brenner and DeLamater 2016). The interviews lasted approximately one hour. The audio was recorded and subsequently transcribed for analysis for analysis and interpretation (Spiggle 1994) assisted by the Dedoose software program.

Our findings contribute to the literature on food socialization (Judd et al 2014) and family consumption (Epp and Velegaletti, 2014; Thomas and Epp 2019) and suggest that interrelations among several factors contribute to the difficulty of habituating new food practices in lower social economic strata, rendering such legislation only partially effective. Specifically, and consistent with previous research (Block et al. 2011; Henneberry et. Al. 2003), our results suggest that knowledge of healthy eating principles is an essential factor. However, our findings show that it is not sufficient to convert new practices into habits and thereby transform family diets because it is important to consider the very long road that must be travelled from an initial understanding of change to the acceptance and habituation of the change (Thomas and Epp 2019).

Particularly in relation to low SEGs, our data shows that mothers in this group have a limited ability to socialize food without warning labels with their children despite being aware of the benefits of healthy eating and having received information through resources such as food labelling. In fact, several factors were found to limit these mothers' ability to carry out the food socialization practices promoted by the legislation. For example, many mothers in our study were heavily overworked both inside and outside the home, and were unable to devote more time to food shopping and to meal planning USDA (2009) and to the enforcement of food decisions they had made. Also, their limited budgets were a restraining factor in their enforcement of meal choices, as they needed to reduce food waste and therefore tended to choose food products they knew their children would accept easily (Haws et al. 2016).

Although extant literature mentions the effects of outside help on family practices (Epp & Price, 2008; Epp and Velegaletti 2014; Epp and Price 2018), it falls short of fully exploring its importance in establishing food socialization practices. Yet our findings suggest that the division of labour in the household is a central issue for food socialization, because the low SEG mothers we interviewed had no access third party help and often had no one with whom to share their responsibilities with, thus making it very difficult for them to change their routine food habits, which usually involved processed foods and often tasty but unhealthy meals, simply because this was faster, hassle free and made their life a little easier.

Moreover, our data suggested gender implications that are extremely relevant for food socialization, as even when there was a male partner in the household, the mothers in our study were the primary caretakers of the children as Chile continues to be a country characterized by patriarchal values (CASEN, 2018). Conversely, the data indicate that if a grandmother or another woman lived in the home, then this housework overload was distributed, thereby allowing the mother to have more time to devote to other tasks, including food purchasing and socialization. Also, the findings reveal that when a mother had to interact with a doctor because of health considerations (whether her own or a relative's health), she was more proactive in changing her behaviour than were other mothers who had not had such an interaction, having seen the consequences of poor nutrition in real life.

Additionally, our results also illustrate the hedonic and relational role of food in the social classes with the fewest resources. For example, given the time constraints and budgetary restrictions affecting low-SEG families, they are more likely to award 'good behaviour' with unhealthy foods than with family outings, for instance (Hughner et al. 2006; Inglis, et al. 2005). Understanding this consumer reasoning enables us to interpret differences in the Labelling Law's impact on various product categories and to propose adjustments to current public policies in order to make them more effective.

Finally, unlike previous works, this study considers the difficulty of converting new practices into habits (Thomas & Epp, 2019). A common view in the literature is that individuals are able to take control of their behaviours and modify them for the better (Grier and Moore 2012). While this idea is attractive, especially when focused on encouraging healthier eating behaviours, it ignores the complex set of forces that can shape or constrain an individual's – and a family's - ability to make meaningful changes to daily routines.

Evaluation Mode Affects Choice of Healthy and Unhealthy Food:
The Role of Taste and Healthiness Attribute Evaluability

Sadaf Mokarram-Dorri, Bocconi University, Italy
Siegfried Dewitte, KU Leuven, Belgium

EXTENDED ABSTRACT

According to the report by the U.S. Department of Health and Human Services, the eating pattern of people in United States is low in fruits and vegetables and excessive in fat and sugar[1]. Shifting the dietary intakes from unhealthy food consumption to healthier food is critical. Prior literature in decision theory has shown that when two products differ from each other on two attributes, one option might be selected based on the attractiveness of the easy- to-evaluate attribute in the separate evaluation mode (SE). However, in the joint evaluation (JE), the difficult-to-evaluate attribute becomes relatively more influential that leads to preference reversal between the two options (Hsee and Leclerc 1998; Hsee et al. 1999). In food decision making, sometimes consumers might decide about an option in the SE, whereas at other times they might choose between options in JE. Often times the options differ from each other on two conflicting attributes of taste and healthiness that are among the most important attributes when people are deciding what to eat (Aggarwal et al. 2016). While some food has better taste compared to others, they might not be as healthy. We integrate the research on attribute evaluability with self-control literature to show how self-control might change from SE to JE in the food domain. An important assumption here is that taste is easier to evaluate than healthiness, since evaluation of taste is more intuitive than the healthiness. In sum we argue:

Hypothesis 1: *Compared to SE, in JE people are more likely to show relatively higher preference for healthy food than unhealthy option.*

Hypothesis 2: *Compared to SE, in JE people are more likely to rely on healthiness of the food than its taste when they are deciding about the food.*

Previous research on the effect of evaluation mode on preference for utilitarian and hedonic products has shown how preference for the utilitarian option might be higher in JE, compared to SE. However, we go beyond the justification (Okada 2005) and goal highlight (Fishbach and Zhang 2008) arguments by investigating the role of two conflicting attributes in the food domain:

Hypothesis 3: *When healthiness of the food is easier to evaluate than its taste, in JE people are more likely to rely on taste of the food than its healthiness and show relatively higher preference for the unhealthy food to healthy alternative, compared to SE.*

We have conducted 4 studies. Study 1 has 3 (evaluation modes: JE, SE of healthy option, SE of unhealthy option) between subject design. Participants were asked to indicate their choice. We used an image of granola bar for the healthy option and an image of chocolate for the unhealthy option with star rating (i.e. 4 out of 5 star vs. 2 out of 5 star rating) for taste and percentage of sugar (i.e. 46% vs. 17%) for healthiness. Next, we measured ease of evaluability of taste and healthiness information and participants' perception of each stimulus. The results for taste and healthiness perception and ease of

evaluability are summarized in table 1 for all the studies. The results showed that the choice of unhealthy food significantly decreased from SE to JE. The effect of evaluation mode on choice share of healthy food was not significant.

Study 2 aims to replicate the results with real choice behavior in an incentive compatible purchasing context in the lab. The result showed that people were significantly more likely to choose the granola bar in JE compared to SE whereas they were significantly more likely to choose the chocolate bar in SE compared to JE.

Study 3 has a 3(evaluation modes) x 2(goal: health goal, control) between subject design. In this study, we sought to extend the previous findings by using a different method to measure preference (i.e. rating scale). We also aim to rule out the goal account as an alternative explanation. The result showed the significant effect of evaluation mode on the preference for healthy food. However, the effect of goal on the preference for healthy food (Mgoal=3.86, SDgoal=2.04, Mcontorl=4.34, SDcontrol=1.78; $F(1,234)$=3.18, p=.08) and the interaction effect were not significant ($F(3,231)$=2.93, p=.09). Note that this marginally significant interaction is not in line with the goal account because the effect of goal activation tends to suppress the rating of the healthy option in SE. The result showed no significant effect of evaluation mode or goal on the preference for unhealthy food (Mgoal=3.97, SDgoal=2.08, Mcontorl=3.57, SDcontrol=2.09; $F(1,235)$=2.04, p=.15). The interaction effect were also not significant ($F(3,232)$=.10, p=.75).

Study 4 aims to show by experimentally manipulating the ease of evaluability of taste and healthiness (Pieters 2017), we can flip the effect. This study has a similar design to study 1, except that we flipped the information formats between taste and healthiness to manipulate their ease of evaluability for two new ice creams as the stimuli. This study is pre-registered on aspredicted.org. The results showed that the choice of healthy (unhealthy) food significantly decreased (increased) from SE to JE, when healthiness was easier to evaluate than taste. This finding is not in line with the justification account.

This research showed that JE might enhance self-control through lower preference for unhealthy food compared to the healthy option, compared to SE, when taste of the food is easier to evaluate than the healthiness information. We contribute to the existing literature on self-control and decision-making by showing when and how JE might lead to higher(lower) healthier(unhealthier) choice of food. Previous research on self-control has measured self- control through measuring preference in both SE and JE even within a single research (May and Irmak 2018; Ferraro, Shiv, and Bettman 2005; Mukhopadhyay, Sengupta, and Ramanathan 2008; Siddiqui, May, and Monga 2017). However, our findings suggest that there might be systematic differences in the preferences of healthy and unhealthy food form SE to JE. This research also provides several practical implications. Companies can provide consumers with easy-to-evaluate nutrition information to increase the impact of healthiness in SE. Joint presentation of the products by retailers can also help consumers to make healthier choice.

Social and Spatiotemporal Track to Reduce Food Waste

Margot Dyen, University of West Brittany, France
Lucie Sirieix, Montpellier SupAgro France, France
Sandrine Costa-Migeon, INRAE, UMR MOISA, France

EXTENDED ABSTRACT

Introduction

Reducing food waste is one of the most challenging objectives associated to our food system, due to its environmental and economic impacts and due to ethical reasons. States keep trying to foster programs, actions or campaigns to target consumers' practices and to foster behavior change towards more sustainable food systems. Literature in social marketing, sociology, and social psychology provides a good understanding of the drivers of food waste at consumers' level. It has been demonstrated that FW depends on education, knowledge, sorting and planning practices, attitude regarding food waste or personal norms (Secondi et al, 2015; Visschers et al, 2016). This knowledge allows formulating recommendations to fight food waste, which mostly target social norms, knowledge and material aspects of food storage and consumption with interventions such as communication, cooking classes, fridge cameras, information on date labelling (Aschemann-Witzel, 2015; Reynolds et al, 2019). However, the spatial and temporal organization of daily practices has been under-considered as levers for action to fight FW, even if several studies demonstrated how FW depends on spatial and temporal drivers (Watson and Meah, 2012), and that we should think about where, when and how meals are eaten (Evans and Welch, 2015).

Objectives

With a social marketing perspective, this study aims at considering the structuration of time and space in the food practices due to social interactions, in order to understand how this generates or reduces FW. The objective is to tackle the causes of FW and to seize the opportunities to fight FW considering social, spatial and temporal settings of food consumption. In this way, this study asks: **how social aspects of food consumption can be sources of FW or on the contrary as levers for reducing FW through the temporal and spatial organization of daily life? How can this be targeted to fight FW?** Taking into account the spatial, temporal and social ordering of daily life, this study allows to better understand FW practices and to co-construct a device with consumers in order to fight FW.

Theoretical framework

Practice theories advocate for an alternative approach to consumer studies which is not based on consumers' rationality but focuses on practices rather than on individuals (Halkier and Jensen, 2011). Individuals are considered as practice carriers rather than decision makers. This stream considers the context of daily routine and how individuals co-construct practices by performing them (Evans et al., 2012; Warde, 2005). Practice theories analyze the "elements" that constitute practices (meaning, competence, material) (Hargreaves, 2011; Shove et al., 2012), and how practices are interconnected (Warde, 2005). Schatzki (2005), who describes practices as a set of actions, invites to study the arrangements of actions in their spatiotemporal dimensions, which responds to the specificity of domestic life, consisting of a set of coordinated actions that form what can be called the daily routine of consumers (Wahlen, 2011). Derived from this work, Southerton (2013) suggests an alternative to dominant behaviorist models of habits and routines. Southerton suggests three alternative concepts for « habits » and « routines » to understand the spatial and temporal ordering of daily life using a practice lens: dispositions – the tendency to perform practices according to culturally derived orientations; procedures – tacit knowledge and embodied skills; and, **sequences** – the ordered performance of practices through material, infrastructural and institutional forms. This holistic approach is relevant to understand how consumers' daily life is organized, and it opens to new forms of intervention that are not based on decision-making.

This study focuses on **how social interactions impact sequences related to food practices and how this generates or reduces FW**.

Methodology

The objective is to develop a methodology able to describe how social aspects of daily food practices suggest particular temporal and spatial organization of practices that impact (positively or negatively) FW. We adopt a comprehensive approach, and opt for a qualitative study conducted in France. Our approach relies on two phases:

1) A two-step qualitative data collection: semi-directive interviews conducted with a projective method of collage aiming at describing food practices and, observations of shopping, storing and cooking practices. The sample was developed to generate as much variability as possible in the practices and preoccupations related to FW: varied age, socio-professional category, household's size, and hobbies (used as an approximation of a part of their interests). Such a sample is adapted to the objectives of this study because it guarantees the presence of varied food practices in terms of product management, relation to food and social context. The interviewees were always at least partially in charge of feeding the household, i.e. they were shopping or cooking regularly. The sample is composed of 23 participants (Appendix 1). Data analysis is two-step: first, we identify the practices associated to limiting FW at a consumer-level. To do so, we use the French Campaign AntiGaspi (Anti-Food Waste, Appendix 2) as a framework to identify the practices associated to FW limitation. Secondly, we identify through thematic analysis the temporal and spatial ordering of these practices, and we identify through thematic analysis the role of social interactions in these ordering.

2) The co-construction of an intervention with consumers through a focus group. Just as during the first step, the sample of 10 participants has to guarantee the presence of various food practices and various social, spatial and temporal settings (Appendix 3). During the focus group, participants are asked to evaluate a proposition of intervention elaborated from the first phase results (presented below).

Results

Results reveal pathways that help to re-consider existing results from a spatiotemporal perspective and thus suggest new interventions to foster FW prevention practices. Three categories of social interactions emerge: 1) uncertainties due to social interactions 2) social norms associated to food consumption with others and 3) task repartition.

1) The uncertainties due to social interactions such as being invited to a friend's house, having friends for dinner or depending on peers' tastes and schedule lead to a destructuration of spatial or temporal ordering of food intake and of product management. It can lead either to **eating out** of home (spatial dimension) or to **postpone the consumption of the planned menu/food** (temporal dimension). This restructures the sequences (ordered performance of practices through material, infrastructural and institutional forms) aiming at anticipating which products, in which quantities will be bought, cooked and eaten. For example, Sylvie (30 years old) explains that she buys the right amount of fruits and vegetables for a week, but a dinner with friends postpone the consumption and leads to FW: "*it happens that I throw fruits and vegetables out because I finally went out with friends*". **2) The social norms associated to the consumption of leftovers** prescribe that managing leftovers is opposed to the figure of the good provider (Visschers et al, 2016). Hence, the sequence (ordered performance of practices) of accommodating and eating leftovers is **postponed** (temporal dimension) and/or **moved out of home** (spatial dimension). Roxane (33 years old) explains that she brings leftovers for her lunches at work, because she and her boyfriend do not eat leftovers for dinner: " *we rarely eat several times the same dish for dinner, it happens but… you know, for the lunch we eat quickly, so for the dinner we enjoy a cool moment*". This case shows that eating leftovers is about finding the right place and time to do it, with the appropriate commensals. In the same way, Marion (31) explains: "*I have recently begun to eat leftovers for lunch since friends of mine told me about coffee shops where you can consume your own food if you buy at least one drink*". These places thus offer a dedicated place to eat leftovers. **3) Task repartition** leads to spatial and temporal organization within daily food practices. Contrarily to the previous two restructuration that rather lead to FW and/or compromise the practices reducing FW, these social interactions foster practices reducing FW. At an individual's scale, task repartition leads to move and differ some practices to another place and time through the action of someone else: as Thibaut (32 years old) explains, *"I prepare daily a lunch box for [me and my girlfriend] from the leftovers"*. Doing so, he allows her to practice the recommendation "accommodate leftovers". In the same way, the possibility to share food shopping helps adapting the quantities bought through a "just-in-time" food provision system without imposing to one individual to shop every day. This is the case of Noémie (26), who is used to shop weekly in a supermarket except for the fresh products (meat, fish, fruits, vegetables and bread) which she buys more frequently to prevent them from perishing. For these products, she calls her mother at work to ask her to *"buy meat, bread or some fruits on her way back to home"*. In this way, the household as a whole establishes anti-food waste practices through the combination of individuals' practices. This is a kind of differing spatially and temporally the sequence of practices fighting FW.

Our results lead to recommendations that take the **collective dimension** into account to foster the practices that limit FW. We suggest a device aiming at facilitating the task repartition between people. This "special leftovers" stage of the fridge is designed to identify quickly and clearly the food that has to be eaten first, thanks to the adjustable size of the zone. We suggest this device to **adapt to the spatiotemporal restructuration of sequences** highlighted above: having a place to stock and to identify at a glance the food that has to be eaten first counterbalances the fact that the consumption had been postponed. During the focus group, this device has been evaluated by 10 consumers. They underlined that it could be really useful as a "*non-verbal communication channel*" (Sonia, 44 years old) that can help more members of the household to commit in the food management. They also underlined that this device can "*dilute personal responsibility*" (Antoine, 21 years old) and that "*even if leftovers are more visible, this will not make people more inclined to eat them*" (Félicie, 28 years old). In this way, this device deserves to be tested in various households to see how it would take part in the social and spatiotemporal organization of daily life through: a) helping task repartition (non-verbal communication; dilution of the responsibility); b) changing social norms (does it lead to keep and/or consume more leftovers?); c) facilitating the management of uncertainties due to social interactions (prioritizing some products). This device should be tested with a practice-based approach: observing the performance of practices and understand the material dimension, the competences necessary and the meanings of practices.

In relation with the spatiotemporal and social organization of daily life that impacts FW, this study shows that places where people can eat their own food out of home foster both social interactions and the consumption of leftovers. This is the case of the coffee shops Marion told us about, where customers can bring their own food; and workplaces Roxane told us about, which are adapted to host lunches (with tables, places to wash lunch boxes, fridge, etc.).

Conclusion

This study contributes to understand how the practices that reduce or generate FW are performed on a daily basis. Through the concept of sequences, it shows that a) the uncertainties due to social interaction and social norms associated to food consumption can jeopardize the organization aiming at reducing FW; b) task repartition fosters FW reduction practices at a household scale. These results lead to propose a new device - the "special leftovers" stage of a fridge, which according to consumers, influences non-verbal communication and task repartition in households. This device deserves to be tested through a longitudinal study. Another perspective of this study is to confirm whether the creation of places where citizens can eat their own food out-of-home contributes to social interactions and anti-food waste practices.

Minimalism in Material Possessions: Theory and Measurement

Lisa Eckmann, Goethe University Frankfurt, Germany
Jan R. Landwehr, Goethe University Frankfurt, Germany

EXTENDED ABSTRACT

In times of growing public awareness of ecological and sustainability concerns, the boom of tiny houses in light of rising house prices, as well as increasing flexibility and mobility demanded by modern working life, minimalism has gained large popularity in the U.S. and beyond as an attractive way of living. In the popular media, minimalism describes a way of living with less—often accompanied by the endorsement of a rigorous decluttering philosophy. In the scientific literature, the research field of anticonsumption (see Makri et al. 2020 for a review) has intensively studied the intentional avoidance of consumption in light of consumers' responsibility regarding environmental, ethical, and socio-political matters (e.g., Alexander and Ussher 2012; Elgin and Mitchell 1977; Leonard-Barton 1981; Shaw and Newholm 2002).

Yet, to date, the literature provides neither a clear theoretical conceptualization of minimalism nor an empirical measurement approach to allow for quantitative and more in-depth research on this construct. The present research fills this gap and develops both a distinct conceptualization and a measurement scale of minimalism.

Minimalism can be broadly defined as the valuation of fewer possessions (Alexander and Ussher 2012, p. 74), which reflects the pure materialistic aspect of anticonsumption without making assumptions regarding the underlying motivations. The literature on sharing, borrowing, and access-based services as forms of consumption alternative to ownership suggests that possessions come with physical, economic, or emotional costs that form a "burden of ownership" (Bardhi and Eckhardt 2017; Bardhi, Eckhardt, and Arnould 2012; Moeller and Wittkowski 2010). This material burden weighs heavily in an increasingly fast-changing, uncertain, and globalized society (Baumann 2000, 2007) that promotes a modern working life characterized by international travel, short-term employment contracts, and frequent changes in employment or, as a consequence, frequent relocation. Modern-day demands for flexibility, mobility, and adaptability in personal, social, and professional life call for a more liquid relationship with material possessions (Bardhi et al. 2012). Liquid consumption as a more temporary, access-based, and dematerialized form of consumption (Bardhi and Eckhardt 2017) matches this current zeitgeist, as it minimizes effort and costs associated with physical possessions.

Accordingly, we argue that minimalist consumers seek to avoid the various costs attached to possessions by minimizing the number of possessions itself. Hence, in line with Alexander and Ussher (2012), we define minimalism as a preference for an overall low quantity of material possessions. Importantly, this preference is not restricted to a specific domain of material possessions (e.g., only clothes) and includes all physical, storable, and non-perishable items of any size of which the consumer is a permanent owner. Notably, as a minimalist preference does *not* reflect a valuation of one's possessions but a valuation of a *low quantity* of possessions, minimalism is conceptually distinct from materialism (Richins 2004). To make consumers' interindividual difference in this preference measurable, we develop the 9-item Minimalism in Material Possessions (MMP) scale.

In study 1, 100 participants created a pool of 400 items reflecting minimalist consumers' attitudes and behaviors based on our aforementioned conceptualization of minimalism. This list was reduced to 61 items in a step-wise procedure including independent appropriateness ratings (Rust and Cooil 1994), careful editing, and redundancy checks.

In study 2, eight consumer behavior junior faculty evaluated the content validity of the remaining items by rating their representativeness of the construct and their comprehensibility on 5-point Likert scales. Items scoring below 4 in both rating dimensions were dropped, which left 21 items.

In study 3 (N=400), we performed a principal component analysis (PCA) on the preliminary scale of 21 items which indicated a one-factor solution. After elimination of items with high cross-loadings, low loadings on the first factor or high content redundancy, a final PCA on the 9 remaining items resulted in a one-factor solution (R^2 = .72). A follow-up confirmatory factor analysis indicated a good-fitting model (χ^2 = 66.34, df = 27; CFI = .99; TLI = .98; RMSEA = .06). The scale is highly reliable (Cronbach's α = .95) and only weakly correlated (r = .11; p = .022) with social desirability (Crowne and Marlowe 1960).

Study 4 (N=400) assessed the convergent and discriminant validity of the MMP scale within its nomological network. A confirmatory factor analysis with the 9 MMP items and 12 other theoretically related constructs yielded a good model fit (χ^2 = 18,457.60, df = 7,547; CFI = .73; TLI = .72; RMSEA = .06). The correlations of the 12 constructs with the MMP scale demonstrated good discriminant and convergent validity (range of correlations from –.42 to .44). We also found significant correlations with demographic variables (i.e., a negative relation to income and a positive relation to education) and variables relating to participants' number of possessions (i.e., the higher the MMP score, the lower the number of possessions).

In summary, by providing a conceptualization and a valid and reliable measurement of minimalism as a preference for a low quantity of material possessions, we contribute to the literature on anticonsumption (Makri et al. 2020) and liquid consumption (Bardhi and Eckhardt 2017). The present research enables future quantitative research on minimalism, such as examining the antecedents (e.g., to disentangle different types of minimalists) and behavioral consequences (e.g., to identify new styles of consumption) of minimalist preferences. If the modern lifestyle gives rise to a gradual shift from traditional ownership mentality to more minimalist mindsets, marketers will need to find more "liquid" solutions for their customers. The MMP scale serves as an important starting point for corresponding research activities.

Consumer Social Responsibility and Actually Available Choices

Rowan El-Bialy, York University, Canada

EXTENDED ABSTRACT

The construction of social responsibility at the consumer level is founded upon the idea that the individual subject's role under capitalism is no longer simply to meet their survival needs, but to intentionally make consumption choices that have positive rather than negative implications for the world beyond the individual (Giesler and Veresiu, 2014; Thompson and Kumar 2018). A plethora of evidence points to a gap between socially responsible values and actions, an attitude-behaviour gap (Belk 1985) whereby many consumers who profess a desire to make responsible choices do not always act consistently with that desire, even by their own measure (e.g., Eckhardt et al., 2010; White et al., 2012). Current theorizations do not explain why some consumers are more likely to make choices consistent with socially responsible consumption (SRC) than others. This paper argues that existing conceptualizations of consumer social responsibility (CnSR) are built upon an implicit theory of rational choice that is inadequate for explaining the reported attitude-behaviour gap (Eckhardt et al., 2010) and consumer resistance against responsibilization efforts (Eckhardt and Dobscha 2019). To address this, a theoretical framework is proposed in which the structurally-embedded consumer is an agentic subject who makes consumption choices while interminably engaging with other subjects, institutions, structures, and history within the field of a capitalist marketplace. In this framework, the link between pro-SRC attitudes and choices is the degree to which consumers can apply their agency to actually available choices.

Like other theorizations of social change, CnSR appears to be built on a purpose-oriented theory of action (Reckwitz 2002). Dominant theories of social change emanate from what Elizabeth Shove calls the 'ABC' framework: A for attitude change, B for behavior change, and C for choice (Shove, 2010). This framework has been criticized by Shove (2010; 2014) and others (Scheurendrand, Parsons, Cappellini, Patterson 2018) due to its failure to consider the structural constraints that "lock" consumers into unsustainable patterns (Newell et al. 2015). Whereas a rational choice theory of action would suggest that pro-SRC attitudes ought to manifest in consumers' exercising agency to change behavior and make socially responsible choices, the framework proposed here builds on practice theory (Bourdieu, 1990; Schatzki, 2010) to suggest that the social and environmental context, as well as the embodied knowledge of the consumer, must also align to make such choices possible.

In their theorizing of CnSR, Schlaile and colleagues (2018) draw on the three spheres of consumer responsibility outlined by Neuner (2001): the social environment, the natural environment, and the duty of caring for oneself. These three spheres of impact represent the intended areas of outcome of CnSR. Drawing on practice theory, a consumer makes consumption choices that can impact these spheres based on embodied knowledge that is imparted to the consumer *by and from* these same spheres. In other words, there is a dialectical relationship between the impact of consumer choices on these spheres and the impact of these spheres on actually available consumer choices. The structural issues upon which CnSR is intended to make a positive impact, such as poverty and global warming (Giesler and Veresiu, 2014), create both real and perceived barriers that limit the actually available choices facing consumers. A consumer can only exercise agency among choices that are actually available (Scheurenbrand et al. 2018), meaning that the consumer views such choices as plausible and accessible options that would meet their consumption needs. Both real and perceived constraints are shaped by the same spheres of impact that Neuner (2001) identifies, namely the social environment, the natural environment, and the self.[1]

This paper contributes to literature suggesting that the responsibilization discourse places a disproportionate burden on consumers who, relative to other actors such as government and corporations, have relatively low power to change structural issues (e.g., Bakkar 2010; Bertilsson 2015; Giesler and Veresiu 2014; Szaz 2007). The proposed framework goes further to suggest that a disproportionate burden is placed on those already impacted by the problems that CnSR seeks to redress, by not only placing greater responsibility onto marginalized consumers but also by failing to recognize that marginalized consumers often cannot select 'responsible' options from among their actually available consumption choices. Research shows that consumers who are marginalized due to class, race, gender, ability, or sexuality are most impacted by structural issues that CnSR is intended to address, such as poverty, global warming, and financial instability (Giesler and Veresiu 2014). These marginalized consumers will also face the greatest real and perceived constraints against their participation in SRC.

Capitalism is best served by a narrative of consumer responsibility that overlooks structurally-determined variations among the choices actually available to consumers. Building on the work of Lemke (2001), Giesler and Veresiu (2014) suggest that the logic of neoliberalism places shared responsibility upon all economically rational actors within a capitalist society, in which consumers' "moral quality is based on the fact that they rationally assess the costs and benefits of a certain act as opposed to other alternative acts" (Lemke 2001, 201). If consumers who are most impacted by the problems which CnSR seeks to redress are also those with the least access to SRC among their actually available consumption choices, then marginalized consumers also become those whose "moral quality" (Lemke 2001) is least likely to be demonstrated by way of participation in SRC.

Proponents of CnSR call for practices that realize the liberatory potential of consumption (Firat and Venkatesh 1995), and the framework presented here suggests that perhaps a more fruitful way towards that potential is of considering consumer choice - and its constraints - as at least partially shaped by those same historical problems that CnSR seeks to redress. In moving away from a purpose-oriented theory of action in CnSR, the current paper suggests that future research would benefit from considering how structures of practice determine the degree to which SRC is within a consumer's set of actually available choices. Future research might also consider how power structures and social disparities exist in relation to consumer responsibility narratives.

Internal and External Reference Price Response in Brand Choice Models

Ossama Elshiewy, University of Goettingen, Germany
Anne Odile Peschel, Aarhus University, Denmark

EXTENDED ABSTRACT

Brand choice models with reference price (RP) response have a long tradition in marketing and consumer research (Briesch et al. 1997, Kalyanaram & Winer 1995, Mazumdar et al. 2005, Neumann & Böckenholt 2014). Research distinguishes between internal RP (Winer 1986, Kalwani et al. 1990) and external RP (Mayhew & Winer 1992, Rajendran & Tellis 1994). For internal RP, consumers are assumed to compare current prices to price expectations developed from past purchases when making a choice (also referred to as memory-based RP). For external RP, consumers make choices by constructing a RP from the currently observed distribution of prices in the choice set (also referred to as stimulus-based RP).

In most previous studies, a clear distinction was made between internal and external RP response in brand choice models. The authors of these studies decided between the RP concepts either based on model fit (Briesch et al. 1997, Terui & Dahana 2006) or compared both model results side by side (Hardie et al. 1993, Bell & Lattin 2000, Klapper et al. 2005, Kopalle et al. 2012). Some previous studies from the 1990s assumed that consumers consider both RP in their choice behavior and allowed both internal and external RP response in one brand choice model (Mayhem & Winer 1992, Rajendran & Tellis 1994, Kumar et al. 1998). However, none of these studies did account for asymmetric RP response. This type of RP response enables the differentiation of gains and losses compared to the RP. Asymmetric RP response in brand choice models has become the gold-standard (Mazumdar et al. 2005, Neumann & Böckenholt 2014) because it can reveal important behavioral response patterns (e.g. loss-aversion, see Kahneman & Tversky 1979). Consequently, a more realistic response with respect to internal and external RP may be missing in these early approaches. Other related previous studies allowed for asymmetric RP response and then proposed a data-driven profiling of consumers with respect to being either internal RP consumers or external RP consumers (Mazumdar & Papatla 1995, 2000, Moon et al. 2006, Dahana & Terui 2006). Only one single previous study has allowed consumers to fully consider asymmetric internal and external RP response in their choice behavior (Van Oest 2013); but the author did not account for heterogeneity across consumers in RP response with respect to loss-aversion. Bell & Lattin (2000) showed that ignoring consumer heterogeneity leads to overestimation of asymmetric RP response for both the internal and external RP concept. Even more relevant than incomplete consumer heterogeneity is that Van Oest (2013) did not allow an interaction between the two RP concepts, which may mask relevant drivers of choice behavior. In addition, more recent advances have been particularly concerned to model purchase incidence in brand choice models to avoid calculating endogenous internal RP (Erdem et al. 2010, Kopalle et al. 2012). This important feature in brand choice models has been neglected in all previous studies analyzing both RP concepts.

From this background, we propose a brand choice model applied to real purchase data that allows consumers to make choices based on both internal and external RP as well as an interaction between these two RP concepts. In line with prospect theory (Kahneman & Tversky 1979), we contend that the already known effects of gains (= increasing choice) and losses (= decreasing choice) from each RP concept will be altered when consumers consider both RP in their brand choice behavior. Following relevant advances, we account for asymmetric RP response, consumer heterogeneity, and purchase incidence (see, e.g., Erdem et al. 2010, Kopalle et al. 2012). By doing so, we improve the current practice in RP modeling by allowing for more realistic choice behavior. The results from our model provide novel insights and contribute to the body of knowledge in RP research.

The general main effects across all our models show that consumers in our purchase data respond more to price increases compared to price decreases with respect to both RP concepts (i.e. loss-aversion, Kahneman & Tversky 1979). These results are in line with previous research (Van Oest 2013). In our proposed model, we find that the negative impact of an external RP loss is mitigated in the case of an internal RP gain, but further amplified in the case of an internal RP loss. An external RP loss means that the brand chosen in the last situation is more expensive compared to the other alternatives in the choice set. If this comes in combination with an internal RP loss (i.e. higher price compared to the price in memory), consumers will less likely choose the brand in addition to the already negative main effects. If the external RP loss comes in combination with an internal RP gain (i.e. lower price compared to the price in memory), consumers will more likely choose the brand due to a weakening of the main effect of external RP loss.

Our results show that in addition to the well-established main effects of asymmetric internal and external RP response (Van Oest 2013), interactions between these RP concepts can have a further impact on brand choice. In comparison to our benchmark models, we show that purchase incidence has to be taken into account to arrive at significant interactions between the RP concepts. This outcome can be explained by the additional structural model component of purchase incidence and brand switching behavior (in comparison to only brand switching behavior). Taken together, our study contributes to the RP literature as the first study to provide evidence for the existence of an interaction effect for internal and external RP response.

The Blockchain Brand

Sunil Erevelles, University of North Carolina at Charlotte, USA
Brian Whelan, University of North Carolina at Charlotte, USA
Padma Bulusu, University of North Carolina at Charlotte, USA

EXTENDED ABSTRACT

Brands represent a core foundation of trust between a firm and its consumers. As trust in brands continues to erode, with only 34% of consumers trusting the brands they use (Edelman 2019), the blockchain is emerging as a key solution for engendering trust, as well as other crucial brand elements, such as authenticity, identity, transparency and security. As blockchains begin to fill the "trust gap" in business and marketing, blockchain-centric logic is increasingly becoming central to building, sustaining and growing strong brands for the future. In this paper, the authors discuss the shift towards the evolving blockchain-centric logic in branding that may help lay the groundwork for future theoretical development and decision making in brand management.

A firm's brand is its critical connection with its consumers. The efficacy of that connection is deeply rooted in the concept of trust and the enduring affective bonds that ensue (Erevelles 1998). Customers use brands to simplify choice, to signal quality and to reduce risk (Keller and Lehman 2006). In recent years, firms have leveraged Big Data by gathering copious amounts of consumer data to better strengthen the consumer-brand relationship. While Big Data has permitted a rich understanding of consumers (Erevelles, Fukawa and Swayne 2016), the improper handling of sensitive consumer information in behavioral futures markets, rampant counterfeiting and extensive breaches of consumer information (Constantin 2019) from centralized cloud facilities has resulted in an alarming decline in trust for brands.

With consumer trust in brands at critically low levels, the blockchain is emerging as a potential remedy, and may become a key foundation for branding in the future. Indeed, a picture of the future "blockchain brand" is emerging, where consumer trust is restored through the use of a secure and transparent technological framework that enhances brand identity and authenticity, while safeguarding consumer data. Although the technological architecture that enables the blockchain to function is complex, its intrinsic value lies in its conceptual simplicity. Simply put, a blockchain is a secured record of transactions between parties (blocks), chronologically connected together (chained) with previous blocks and governed by a consensus mechanism to form an open, immutable and decentralized ledger of market activity. When needed, the ledger can be programmed to initiate transactions automatically, and execute the transfer of value. Blockchains are cryptographically secured, verified by consensus and publicly shared, thus making malicious behavior difficult.

The theoretical foundation of blockchain builds on game theory (von Neumann and Morgenstern 1944), with a particular focus on "new institutional economics" (North 1991). Game theory is the study of "mathematical models of conflict and cooperation between intelligent rational decision makers" (Myerson 1991). In North's institutional economics terms, blockchain can simply be thought of as a virtual decentralized institution. From cave people societies, humans have constantly searched for ways to lower uncertainty during the exchange of value (Serres and Warburg 2017). The blockchain, as part of the continuing evolution of institutions, is simply a virtual decentralized institution that allows us to lower uncertainty in marketplaces for assets such as brands, with technology alone and without centralized intermediaries. A series of foundational premises are next developed to help create a theoretical framework for the blockchain brand.

First, the blockchain represents a *fundamental paradigm shift* from the one associated with Big Data. While the World Wide Web, and in particular, the Big Data paradigm, focuses on the "sharing of information," blockchain is focused on the "exchange of assets," such as brands. In other words, the World Wide Web was designed for information, not for e-commerce. Security on the web is often an afterthought. Consumer trust is often violated deliberately or inadvertently. Opacity is often used to compromise consumer data. Blockchain mitigates these problems to help create strong and enduring brands.

Second, blockchain enhances *brand trust* by replacing subjective trust in brands and brand messaging by centralized institutions with objective, verifiable distributed trust in technology to better ensure the integrity of a brand. Trust is the basis for all successful consumer/brand relationships. Blockchain helps the consumer-brand relationship move from "blind trust" to "smart trust" (Covey and Link 2012).

Third, blockchain enhances *brand authenticity* by providing certifiable digital records of a brand, enabling consumers and other stakeholders to track and authenticate any brand asset over its lifetime. Brand authenticity may be defined as "the perceived genuineness of a brand" (Fritz, Schoenmueller and Bruhn 2017). With the help of the blockchain, brand authenticity is protected from the deleterious effects of counterfeiting, for example, through the creation of a secure, chronological and verifiable digital record that transparently indicates all transactions across the lifespan of the brand asset.

Fourth, blockchain enhances *security* for a brand's consumers by cryptographically protecting consumer data and distributing such data across the blockchain network.

It does this through a tamper-resistant cryptographic process that can authenticate identities, thus assisting mistrustful strangers around the world to securely conduct business with each other (Nordrum, 2017). Security is reinforced by the use of an encrypted public and private key process similar to the two-key process used in safety deposit boxes at a bank (Tapscott and Tapscott, 2018).

Fifth, blockchain facilitates *disintermediation* in branding by empowering consumers to objectively verify a brand asset and stated value proposition without the need of potentially untrustworthy intermediaries. A consumer, for example may trust an automobile brand, but mistrust an automobile salesperson. Through blockchain, consumers are provided with accurate, verifiable and secure means to evaluate brands and brand messaging without intermediaries.

In conclusion, the potential magnitude of the benefits of the blockchain in a variety of branding situations, such as co-branding (e.g., Erevelles et al. 2008), brand extensions (e.g., Volckner and Sattler 2006) and brand accessibility are considerable. The blockchain may represent a catalyst that will be central to brand management in the future. While its potential is vast, considerable further research needs to be carried out before the value of blockchain in branding can fully be realized. It may be a fair to conclude, however, that this paper may serve as a modest first step in the realization of that potential.

Co-creation between Consumers or with Firms: Determinants, Consequences and Components of Value Consumption in Services

Camille Eslan, FFE - INRAE - IFCE - Montpellier Supagro, France
Sandrine Costa-Migeon, INRAE, UMR MOISA, France
Céline Vial, IFCE - INRAE - UMR MOISA, France

EXTENDED ABSTRACT

In the context of leisure sports, many people are leaving sporting clubs to self- organize (Chillet 2019), alone or with other consumers (Heinonen, Campbell, and Ferguson 2019). This poses a problem for clubs and sport federations as it leads to a decrease in members' number (Eslan, Vial, Costa and Rollet 2019). This presentation will review the literature on value co- creation (VCC) / prosumption to understand (i) what determines consumer participation in the production process and (ii) whether the service offering of a firm using value co-creation could substitute for consumer self-organization. We first present the determinants and consequences of consumer participation in a co-creation process with a business or among consumers. This part highlights the crucial role of value in customer decisions, introducing the value creation process described in the second part. Thirdly, we propose an integrative approach of value co-creation in the choice of service production applied to self-organized activities.

Prosumption, the act of consuming and producing, allows consumers to personalize their products or services. If this process is carried out in relation with several actors (professionals, consumer groups, organizations or individuals), we speak of value co- creation, with personalization often mainly managed by companies. Leclercq, Hammedi, and Poncin (2016) defines co-creation as "*a joint process during which value is reciprocally created for each actor (individuals, organizations or networks)*" to interact and exchange resources. In line with Heinonen, Jaakkola, and Neganova (2018), we posit that C to C co- creation depends on the value inherent in the interaction between the customer and the provider, but also emerging from the interactions between customers.

Prior research has shown the importance of motivations for engaging in prosumption. Its antecedents are rooted in either the customer's buying experience or the decision-making process. Carrying out a project of prosumption requires knowledge, skills, community seeking and time (Wolf, Albinsson, and Becker 2015). Heinonen *et al.* (2018) show a range of drivers of C to C interactions induced by firms, situations or customers (motivations), these are either for different social or personal benefits. Benefits are thus emotional value or reinforcement of affective (i.e., emotional) and network (i.e., social) values for focal clients through the playful and ludic behaviors of other clients (Kim, Byon, and Baek 2019). In sport, C to C co-creation studies show that the presence of interactions motivates participants, thereby enhancing consumer experience (Kolyperas, Maglaras, and Sparks 2019). Moreover, willingness to participate to future co-creation activities depends on past experience, thus on the consequences of the process influenced by moderators such as trust or demographic determinants. These moderators act either before, during or after VCC process.

Furthermore, in line with Aurier, Evrard, and N'Goala (2004), we integrate overall perceived value as a consequence of VCC process. The sacrifices made and the benefits perceived constitute overall perceived value. It goes beyond the profit to cost ratio shown by Xie, Bagozzi, and Troye (2008), which is not only an economic benefit or cost. However, if this overall value is in favour of sacrifice, consumers will turn to outsourcing rather than prosumption. The relationship between value creation and process outcomes then underlines the central role of value in the consumer's decision to participate in production, especially under the influence of overall perceived value, as some components of value seem more decisive than others in consumer participation. The absence of certain components may lead to the co-creation process being halted. Our position herein is to analyze value creation resulting from consumer interactions and components of this value as preferential judgments.

We propose an integrative picture of the different dimensions of value based on Holbrook (2002) and Aurier *et al.* (2004). The above criteria have thus resulted in a typology that breaks down the value into four main components: instrumental, hedonic, social and spiritual value. We enrich the spiritual value component with holistic value (Lai 1995) which is the perceptual benefits that depends on how compatible or coherent this consumption is perceived by the consumer. Furthermore, we support Medberg and Heinonen (2014) research on the influence of invisible values. These authors consider that value creation emerges either by the companies, in the relationship between companies and customers, or by the customer alone. Thus, spiritual value also refers to *shared moral value* as the adequacy between customers' own moral standards and the standards of the other stakeholder. Corneloup (2016) in climbing activity shows an opposition of practitioners according to their practice style. Californian-style practitioners focused on their relationship with nature and do not wish a more competitive form motivated by quick climbing on an artificial wall. Moreover, *responsibility value* is defined as the firm's "*practice of responsibility and integrity towards its customers*". Both values relate indirectly to how the companies operate, then they can be integrated as intrinsic others-orientated approach. For *heritage value,* based on the history of the customer and its relatives with the company, we consider it more as social value, as heritage exclusively depends on consumption experience of the customer and its relatives. Like the *relationship value*, defined as a long-term relationship between actors, these values are based specifically on the clients' own logic.

This critical qualitative analysis of VCC literature tries to understand why consumers do engage in VCC with companies or in C to C. The analysis of value components highlights invisible values that may explain why consumers prefer to co-create with others than with firms. Indeed, when consumers do not find all value dimensions they are looking for in the professional structures, then they drop out of professional structures. Future researches should focus on supply and demand adequacy to restructure service offer for companies, and confirm the integrative approach of value in the analysis of consumers' participation to co- creation. Firms have leverage if they take into account the value dimensions in the co- creation process in order to recapture consumers organized in C to C, but also, on a critical perspective, to find out what occurs when consumers are not able to co-create, do not want or see value in the process.

Shopping Carts Affect Purchasing by Activating Arm Muscles

Zachary Estes, Cass Business School, UK
Mathias Clemens Streicher, University of Innsbruck, Austria

EXTENDED ABSTRACT

A fundamental goal of retail managers and consumer welfare advocates alike is to identify factors that affect shopping and purchasing. One factor that may influence purchasing, but which has received little attention by marketing researchers, is the shopping cart (see Cochoy 2008; Larson, Bradlow, and Fader 2005; Van Ittersum, Wansink, Pennings, and Sheehan 2013). The present research provides the first investigation of how the physical properties of shopping carts influence purchasing. We deduce a surprising hypothesis with tangible economic implications: Standard shopping carts, which shoppers push via a horizontal handlebar, may actually *decrease* purchasing.

Horizontal handles naturally elicit gripping with *wrist pronation*, in which the palms face downward. Wrist pronation, in turn, activates the *extensor muscles* of the arm (Argubi-Wollesen, Wollesen, Leitner, and Mattes 2017). Finally, activating the extensor muscles decreases attitudes toward objects (Cacioppo, Priester, and Berntson 1993) and evokes avoidance motivation (Förster, Higgins, and Idson 1998). Activating the *flexor muscles*, in contrast, tends to improve attitudes and evoke approach motivation.

We developed a novel shopping cart that, instead of having a horizontal handlebar, has two parallel handgrips that induce a *neutral wrist posture* in which the palms face one another. The orientation of the handles, together with their slightly lower placement, activates the flexor muscles (cf. Argubi-Wollesen et al. 2017). This novel shopping cart thus should elicit more purchasing than standard shopping carts.

Lab Study 1 (N = 126 students) tested whether shopping with pronated wrist posture decreases hypothetical purchasing. Participants viewed products from a variety of categories (e.g., beverages, office supplies) while pushing a modified shopping cart with either pronated or neutral wrist posture, and they indicated how many of each product they would like to purchase at the given price. We calculated three dependent variables from participants' hypothetical purchases: *quantity* (total number of items selected), *variety* (number of different brands selected), and *spending* (total cost in €). As hypothesized, the pronation group hypothetically purchased significantly lower quantities, with less variety and lower spending (see Table 1). Wrist pronation reduced hypothetical purchases in six of seven product categories, including not only "vice" products such as snacks, but also "virtue" products such as cleaning products (see also Streicher and Estes 2016).

Lab Study 2 (N = 100 students) tested whether the effect is due to wrist posture, or to flexor muscle activation. We replicated the procedure of Study 1, but here participants pushed either the cart with parallel handgrips (same as in Study 1) or another novel cart with vertical handles. The shopping cart with vertical handles also induces neutral wrist posture, but critically, because the handles are relatively high and angled forward, they activate the extensor muscles rather than the flexor muscles. If the effect is due to neutral wrist posture, there should be no difference between carts. If the effect is due to flexor muscle activation (Cacioppo et al. 1993), then parallel handgrips should induce more hypothetical purchasing than vertical handles. As shown in Table 1, the parallel handgrips induced significantly more hypothetical purchase quantities, more variety, and more spending. Thus, the increased purchasing with parallel handgrips ap-

pears to be due to flexor muscle activation rather than wrist/forearm posture alone.

Field Study 3 (N = 228 shoppers) tested whether standard shopping carts with a horizontal handlebar–which induces wrist pronation–decrease sales in a grocery store. We conducted a field experiment using two types of shopping carts in a typical European supermarket. Shoppers were given either a standard cart that induces wrist pronation, or our modified cart that induces neutral wrist posture. Unbeknownst to the shoppers, when they paid for their purchases, the cashier surreptitiously recorded whether they had shopped with a standard-pronation cart or a modified-neutral cart. Linear regression with cart-type (neutral = 0, pronation = 1) as our focal predictor, age, mood, and cart ergonomics as control factors, and spending as the dependent variable revealed a significant overall model, $F(4, 223) = 10.76$, $p < .001$, $R^2 = .16$. Most importantly, after statistically accounting for those control factors, cart-type significantly predicted spending, $\beta = -.14$, $t = 2.14$, $p = .03$. This effect was also significant without any control variables, $t(226) = 2.66$, $p < .01$, $d = .37$. Thus, shoppers spent more of their own real money when shopping with a modified cart that induces neutral wrist posture than with a standard cart that induces pronated wrists.

In sum, these experiments provide robust evidence that standard shopping carts with horizontal handlebars decrease purchasing. Horizontal handles, by virtue of activating extensor muscles, decrease product evaluations (Cacioppo et al. 1993), evoke avoidance motivation (Förster et al. 1998), and ultimately decrease purchasing. A novel shopping cart with parallel handgrips significantly increased purchase quantity, variety, and spending. Parallel handgrips activate flexor muscles, thereby improving evaluations and evoking approach motivation (Cacioppo et al. 1993; Förster et al. 1998).

This research contributes substantially to the literature on basket size, i.e. the average quantity of products that shoppers purchase on a given occasion (Manchanda, Ansari, and Gupta 1999). Because basket size directly impacts a shop's profit (Walters and Jamil 2003), managers often use a number of in-store marketing actions to influence shoppers' basket decisions (Gilbride et al. 2015; Inman et al. 2009). Prior studies have examined how shopping carts affect shopping behavior (Cochoy 2008), such as "smartcarts" that influence spending by informing shoppers' of their total costs as they shop (Van Ittersum et al. 2013). However, the present research is the first to examine the physical properties of the shopping cart itself as a marketing tool for influencing shopping and buying behavior.

This research has tangible economic implications for retail managers, suggesting that the shopping carts currently available in most large retail outlet may decrease sales. On the other hand, in terms of consumer welfare, the standard shopping cart with a horizontal handlebar induced shoppers to spend less money. For the majority of shoppers, who face a constant battle against over-spending and over-consumption, standard shopping carts thus may act as an unexpected restraint on spending and consuming.

Social Dynamics in Consumer Communications: How Hierarchy Shapes Language

Linying (Sophie) Fan, Hong Kong University of Science and Technology, China
Derek Rucker, Northwestern University, USA
Yuwei Jiang, Hong Kong Polytechnic University, China

EXTENDED ABSTRACT

The importance of consumer communications has led to an increased interest by academics to understand the very nature of consumers' language. Specifically, academics have begun to explore how properties of language, such as sentence structure as well as word choice, affect both the memorability and persuasiveness of communications (e.g., Danescu-Niculescu-Mizil et al. 2012; Packard, Moore, and McFerran 2018; Rocklage, Rucker, and Nordgren 2018).

Given that language is by definition a tool people use to communicate with another in the social realm (Duranti and Goodwin 1992), social dynamics are inevitably involved in the social parties communicating with each other in language (e.g., Eibl-Eibesfeldt 1989; Maynard and Peräkylä 2003). As one of the most fundamental parts of social relations (e.g., Magee and Galinsky 2008), power plays a central role in social dynamics. Indeed, the perception of power both shape and is shaped by social dynamics (Ng and Bradac 1993). Individuals use power perception to judge and experience their social relationships and the communication that occurs within them (Ng and Bradac 1993). Given the substantial impact of power on social dynamics, it is crucial to understand how consumers' sense of power affects both their construction and reception of language in marketing communications.

The current research proposes that the feeling of powerfulness increases consumers' language conciseness. This is presumably because that the feeling of powerfulness enhances consumers' perceptions of self-efficiency and assertiveness in decision making (e.g., Anderson and Galinsky 2006; See et al. 2011), and consequently reduces their need to justify they decisions and actions to others. This reduced need-for-justification further leads to enhanced language conciseness among high power consumers. Consistent with this proposed underlying mechanism, we predict that this effect will be mitigated when the communication contexts require less justification (e.g., in non-evaluative communications). From the opposite angle, given the power perception makes people focus on asymmetric control over resources and lead them to take a double-standard on themselves and others (Magee and Galinsky 2008; Rucker, Galinsky, and Dubois 2012), we further predict that high-power consumers would be less persuaded by concise (vs. detailed) marketing languages from companies.

In Study 1, we used a real-world dataset of Enron's (an energy trading company) internal email communications (N = 10,308 emails) to investigate the effect of powerfulness on language conciseness. Previous research has provided amble evidence that individuals' ranks in their job can be considered as an index for their perception of power (e.g., Magee and Galinsky 2008). Thus, we categorized Enron employees' corporate roles into eight job ranks. The power index of email sender was calculated by subtracting the job rank of the recipient from the rank of the sender. And language conciseness was measured through calculating the number of words in each email (Pennebaker, Francis, and Booth 2001). As predicted, the feeling of high power leads employees to use more concise language in their emails. More importantly, we found that down-emails (*the sender has a higher rank than the recipient*) were more concise than both peer-emails (*the sender has the same rank as the recipient*) and up-emails (*the sender has a lower rank than the recipient*) and

the latter two conditions did not differ significantly, suggesting the observed effect is driven by a feeling of powerfulness rather than a feeling of powerlessness.

Study 2 (N = 136) provided direct process evidence by showing the mediating roles of need-for-justification. Power was manipulated through an imagination task (adopted from Rucker, Dubois, and Galinsky 2011). Participants imagined they are either a boss (*high power condition*) or an employee (*low power condition*) at a company. Next, in an ostensibly unrelated task, participants imagined that a foreign tourist they met on the street asked for their recommendations regarding two local museums. They were provided two different recommendations varying in conciseness and were asked to choose one recommendation to reply to the tourist. Finally, we measured their perceived need-for-justification via three items (Hsee et al. 2003). As expected, participants in the high power condition were more likely to choose the more concise recommendation than those in the low power condition and this effect was mediated by need-for-justification.

If the effect of power on language conciseness is indeed driven by the reduced need-for-justification among high power individuals, we should expect to a weakened effect when the communication context naturally need less justification, such as non-evaluative communications. Study 3 (N = 240) tested this hypothesis through a 2 (high power vs. low power) × 2 (evaluative context vs. non-evaluative context) between-subjects design. Participants first completed the same role imagination power manipulation task as in Study 2. Then, participants were presented with two products and were asked to write a product evaluation (*evaluative context*) or a product description (*non-evaluative context*). Results showed that participants in the high (vs. low) power condition wrote more concisely in the evaluative context. However, the difference disappeared in the non-evaluative context.

Study 4 (N = 212) illustrated the bidirectional effects of power in language conciseness by showing high-power consumers are less persuaded by concise marketing language from companies. The reason behind this prediction is that although high power individuals feel that they do not need to explain their opinions to others, they still want to hear others' justifications. We used 2 (high power vs. low power) × 2 (concise information vs. detailed information) between-subjects design. After the same power imagination manipulation, participants evaluated three products in randomized order. We manipulated language conciseness via the length of marketing information provided in ads. The results demonstrated that high power participants were less persuaded by concise (vs. detailed) product information and low power consumers did not show this difference.

In conclusion, this research makes a novel contribution by demonstrating how consumers' perception of power shapes their language selection. Our work also highlights the impact of power in marketing communication by showing its different impacts on both message senders and receivers. Further, our research suggests potential tactics that companies can use to increase the effectiveness of their marketing language.

The Effect of Image Content and Text Similarity on Brand Narratives Sharing

Stefania Farace, LUISS Guido Carli, Italy
Francisco Villarroel, LUISS Guido Carli, Italy
Dhruv Grewal, Babson College, USA
Ko de Ruyter, King's College, UK

EXTENDED ABSTRACT

Over *40* billion images have been shared to date on social media platforms. Despite the growing interest in visual driven content, *66%* of brands still do not understand what type of images contributes to a compelling narrative (Buffer 2019). Therefore, it is crucial to analyze the impact of images in social media posts and their impact on consumer sharing.

Inspired by visual semiotics theory (Kress and van Leeuwen 2006), we propose that narrative images, that is images portraying an action among depicted objects, have a positive effect on consumer sharing. Social media platforms allow for consumption of narrative images which often include textual information. While including both image and text in the same brand message may provide the viewer enough information to understand the message (Villarroel Ordenes 2019), we suggest that viewers may feel overwhelmed by the amount of text in the caption and within the image when exposed to a narrative image. In line with this, we propose that narrative images have a negative effect on consumer sharing when the caption and text within the image are similar.

Sharps and Nunes (2002) show that images portraying relationships among visual elements are easier to process verbally (e.g., "moving to the right", "looking to the horizon"), and consequently are more feature-intensive than images not including relationships. Accordingly, we propose that images showing action (narrative) are more likely to be processed in a piecemeal fashion while, an image which is not showing relationships would be processed in its entirety, as a gestalt (Sharps and Nunes 2002). Piecemeal interpretation mediates the effect between narrative images and consumer attitude/sharing.

Our first study examines the effects of narrative (vs. conceptual) images, similarity between the caption and text within the image, and their interactions, on message sharing. We collected *6,187* social media posts from Twitter. We operationalize consumer message sharing as the number of retweets. Using extant definitions of the image type (Kress and van Leeuwen 2006), we asked two research assistants to annotate the images as narrative (i.e., showing unfolding actions and events) or conceptual (i.e., stable, static, and timeless). We computed the mean value provided by the two coders and used it as our independent variables ($r = .69$). To measure text similarity between the caption and the text within the image we used the Jaro–Winkler distance metric which captures the similarity between two string sequences. In line with previous research, we account for several control variables.

Our model for share is:

$$\# Share_i = exp(\alpha_0 + \beta_1 * \#Share_{i-1} + \beta_2 * Narrative_i + \beta_3 * TextSimilarity_i + \\ + \beta_4 * Narrative_i * TextSimilarity_i + \tau_i \\ + \beta_n \theta_n + \alpha_k + \epsilon_{ij}),$$

Where τ_i indicates the control residuals from the control functions (they allow to account for content manager decisions in previous posts; Villarroel Ordenes et al. 2019), represents the control variables and their respective coefficients, and are the brand fixed effects and error term, respectively. Our results confirm that consumers share significantly more narrative images than conceptual ones ($\beta_{Narrative}=.97$, $p<.001$). We also find support for our prediction that when narrative images are paired with highly similar caption and text within the image, the effect on consumer sharing becomes negative ($\beta_{Narrative \times TextSimilarity}=-.24$, $p<.001$).

Our second Study examines how the content of the image in a Twitter post influences attitude towards the Tweet, consumer sharing, and piecemeal interpretation. One hundred Amazon Mechanical Turk participants ($M_{age}=41.21$ years, SD=12.15; 59% female), paid $.40, participated in this image content (conceptual vs. narrative) between-subject experiment.

The Nike Tweet portrays a basketball player and the caption for both Tweets was kept constant. The image presented the basketball player either posing (conceptual) or tossing a basketball (narrative). Participants were exposed to one of the Tweets, then expressed their willingness to share the Tweet and their attitude towards the Tweet. We also measured piecemeal interpretation and whether the image was perceived to be conceptual or narrative (same as in Study 1). As control variables, we measured perceived quality and involvement with the Tweet. Our results show that participants perceived the image where the basketball player was simply posing as conceptual (M=2.45, SD=1.78) and the image where the basketball player was tossing the ball as narrative (M=4.14, SD=1.65). The two images did not differ in terms of perceived quality ($t_{(98)}=-1.02$, NS) and involvement ($t_{(98)}=-.69$, NS).

An independent sample t-test of the means across visual patterns that participants exposed to the narrative image (M=5.26, SD=1.80) express a more favorable attitude toward the post than participants exposed to the conceptual image (M=4.54, SD=1.48) ($t_{(98)}=-2.19$, $p<.05$). Unexpectedly, an independent sample t-test of the means across visual patterns reveals a non-significant difference in terms of sharing ($t_{(98)}=.78$, *NS*). An independent sample t-test of the means across image content reveals that participants exposed to the narrative image (M=5.98, SD = 2.16) interpret the image in a piecemeal fashion more than participants exposed to the conceptual image (M=4.08, SD=1.70) ($t_{(98)}=-2.32$, $p<.05$). To determine if piecemeal interpretation drives the relationship between the image content (1=narrative, 0=conceptual) and the dependent variable of attitude toward the Tweet, we conduct a mediation analysis using Model 4 (10,000 bootstrap samples) in the SPSS PROCESS macro (Hayes and Preacher 2014). The bootstrapping technique for conditional indirect effects indicates mediation, because the 95% confidence interval (CI) for piecemeal interpretation does not include zero when we consider the difference between conceptual and narrative image (conditional indirect effect=.25, Boot SE=.15; 95% CI: .02, .58).

The findings of our study provide insight into the role of images and text in social media conversations by making three important contributions. First, this study demonstrates that narrative images are shared more by consumers than conceptual images. Second, we advance knowledge on consumer sharing of brand narratives by considering how similarity between text in the caption and within the narrative image affects consumer sharing. Third, our results show that the positive effect of narrative images on consumer responses is driven by piecemeal processing of the visual information in the Tweet.

Marketplace Violence and Community Resiliency: Individual and Collective Transformation Following the Paris November 2015 Terrorist Attacks

EXTENDED ABSTRACT

"There is the before and the after. We all have to live in the after."
– Interview informant

As evidenced in the above quote, one of the defining elements of trauma, personal or collective, is its transformative nature. There is no going back, only moving forward. Indeed, even highly resilient individuals are not immune to tragedy, whether a personal crisis or a national tragedy such as the Paris marketplace attacks in November 2015 or other national acts of mass shootings and terrorism. Given the current political climate and recent history of violence, marketplace attacks are unfortunately a reality of modern life. Although the economic damage of terrorist attacks is documented (Frey et al 2007), it is not well understood how marketplace communities and collectivities cope and how collective resiliency is constructed from individual restoration activities.

Extant consumer research has examined several aspects of consumption when existential threats strike. Scholars have explored shared consumption experiences after natural disasters (Baker et al. 2007), the adaptation following personal health crises (Pavia and Mason 2004, Pounders and Mason 2018), and the challenges for marketplaces following the violence of war (Barrios et al. 2016, Schultz et al. 2005). Indeed, such literature suggests that consumers' marketplace consumption changes significantly, and in doing so reveals the potential for transformative consumer experiences.

Cultural trauma is argued to occur *"when members of a collectivity feel they have been subjected to a horrendous event that leaves indelible marks upon their group consciousness, marking their memories forever and changing their future identity…"* (Alexander 2013, p. 6). However, a gap in the literature is how the entire collective community rebounds through the desire of individuals to express their connection to the event and their link to one another via certain, meaningful consumption choices. Specifically, we extend Alexander's theory of social trauma by focusing on individual responses in the moment, prior to group processing and understanding of an event, and how individuals' attempts at sensemaking pull them towards collective consumption activities and ultimately collective restoration.

On November 13, 2015, militants from the Islamic State in Iraq and Syria attacked eight marketplace sites in Paris, including the soccer stadium, a concert hall, and four cafes located in an east Parisian neighborhood with an active nightlife and popular outside seating. Thus, places and people were targeted but also the rituals and symbols of the Parisian café and nightlife, where the community gathers together to share a physical space and a drink. We ground our study in this context and investigate using qualitative inquiry. To date, we have reviewed articles and documentaries, examined the archives of memorial data, interviewed a café owner of an attacked site, and conducted 28 semi-structured in-depth interviews with individuals consuming and living in the neighborhood. The interviews were conducted in French and English; all the respondents were in Paris during the evening of the attacks.

Analysis of the data suggests themes of closeness to the event, remembering, resistance, and resiliency through consumption. Most informants started their narrative of the Paris attacks by explaining how they were connected to the sites of the attacks, that is their perceived closeness. Remembering involved visiting the sites, leaving messages and items, and publicly honoring lives lost and altered. Extant research on memorials and social response to terrorist attacks questions why individuals feel the need to express their connection to the traumatic event rather than avoiding thoughts and scenes of the trauma (Truc 2018, p. 97). In contrast, coding of interviews for current research indicates how nearly all the members of the community were drawn to the sites of the attacks to both demonstrate solidarity and comfort themselves.

Findings from our research indicate that consumption plays a key and unique role in building resilience because it offers the tactile and physical expression of emotion that is key to processing trauma. Traumatic events such as the Paris 2015 terrorist attacks are, by their nature, transformative. Understanding consumption choices after a collective trauma such as the Paris 2015 terrorist attacks is key to understanding the process of resiliency and its origin, ultimately offering hope as well as lessons for businesses, local communities, public policy response, and movement towards a positive transformation.

In short, prelusive coding of the interviews indicates that the trauma to informants is influenced by that person's perceived closeness to the community impacted by the terrorist attack. The trauma can be on some level lessened and the individual can find some relief by a tactile and visual expression of connection (Grider 2001) to this community. With a resumption of previous consumption routines as well as public displays of solidarity through consumption choices, such as visiting and contributing to the memorial(s), informants experience some respite and relief from the numbness and isolation endured after the violence. The individual's sensemaking of the event and reactions to the event provides the scaffolding that supports the development of resiliency. In other words, while the marketplace was the location and the source of the trauma, it also provides the means for hope and recovery, both literally in terms of rebuilding and more deeply in terms of community connection.

The Bell Curve is Counterintuitive

Lin Fei, University of Chicago, USA
Luxi Shen, Chinese University of Hong Kong, China

EXTENDED ABSTRACT

Consumers encounter new information on a daily basis, but in the absence of outside information, what do they intuit about the distribution of an unfamiliar specification? For example, do consumers intuit that the miles per gallon (MPG) of most SUVs are similar, or evenly spread out? Generally speaking, what distribution do consumers mentally picture for a product specification about which they possess little knowledge?

Much cognitive psychology literature (Edwards 1968; Hogarth 1975; Winkler 1968) focuses on belief updating and shows that people insufficiently update their beliefs with new information. Many consumer psychologists also examine belief updating in different domains (Moorthy, Ratchford, and Talukdar 1997). We, however, are curious about how people form the initial mental representation—hereafter, the intuitive distribution—prior to seeing further information.

Intuitive distributions have great marketing implications since much work has shown that subjective distributions influences consumers learning and searching behavior (e.g., Brucks 1985; Dellaert and Haubl 2012; Johnson and Russo 1984; Jindal and Ariibarg 2018). In identifying the shape of the intuitive distribution, we provide insights on individuals' cognitive nuances in consumers' searching and learning process for new products. Our research also carries theoretical significance to Bayesian models of information updating, as the original mental distribution can determine subsequent prediction functions and model performance (Griffiths and Tenenbaum 2006).

Extant investigations on the intuitive distribution are relatively limited. While some scholars (Winkler 1967) postulate that people tend to generate a normal distribution for any specification they encounter, we propose that people intuit a uniform distribution when they possess little knowledge about the specification. With limited knowledge, or maximum normative uncertainty, people may not be aware of the factors that make some outcomes more likely, so they assign equal consideration to all possible outcomes (Hacking 2006). For example, most consumers do not know much about how MPG varies among SUVs, so when asked to describe the distribution, we predict that consumers will think that SUVs should vary widely in MPGs. Thus, they will generate a distribution that resembles a flat line more than a bell curve.

We further propose that specification familiarity moderates the shape of intuitive distributions. In particular, we hypothesize that when people have no familiarity about a specification, they will generate a uniform distribution, but when they have some general familiarity about that specification, they will generate a distribution that is less flat and more bell-shaped. In real life, people may generalize what they see or are told about the distributions of things in this world. However, people tend to overgeneralize cognitive shortcuts (Tversky and Kahneman 1974) and may fail to update beliefs for this reason. Therefore, we predict that as specification familiarity increases, people will generate a more bell-shaped distribution, even when the actual distribution is neither flat nor bell-shaped.

We tested our hypotheses in 7 studies with 1930 participants in total, and we present 4 studies in this paper. All experiments adopted the same methodology by eliciting a distribution directly: given a specific scenario, participants allocated N items into n bins to generate a distribution in their mind (empirically validated with high reliability, Goldstein and Rothschild 2014). Distribution data were analyzed on the individual level by examining the kurtosis (fourth moment, indicating the peakedness) of each distribution.

Study 1 tested the main hypothesis that people intuitively generate uniform distributions for a variety of unfamiliar specifications. Participants read six scenarios (out of a pool of 12); each scenario asked participants to allocate items into several bins (e.g., How many of the Beatles' 211 songs do you think would fall into each of the following seven time-length ranges?). With this allocation method, each participant generated a distribution for each scenario. We found that (a) across all scenarios, participants generated intuitive distributions that were significantly different from the normal distribution, and (b) in each scenario, more than 50% of participants generated a distribution that was flatter than the normal distribution. Thus, Study 1 provided robust evidence in support of our main hypothesis that the bell curve is counterintuitive; instead, intuitive distributions are spread out.

Studies 2 and 3 examined in more depth the moderators determining the shape of an intuitive distribution. Study 2 used the aforementioned Beatles question which elicited the most peaked distribution in study 1. In study 2, people who were more familiar with the specification (rock song lengths) generated distributions with higher kurtosis, while other potential moderators, such as confidence, did not have an effect. We further experimentally manipulated specification familiarity in study 3 by asking participants to generate distributions for two conditions (Unfamiliar: length of Haydn's symphonies; Familiar: length of Billboard Top 100 Hit Songs in the 1990s). We found that participants generated significantly more peaked distributions in the familiar condition than in the unfamiliar condition (median kurtosis = 3.08 (Familiar) vs 2.25 (Unfamiliar), Wilcoxon's test of kurtosis W=38670, p<0.001). These findings suggest that specification familiarity makes the intuitive distribution curvier by adding one peak to it.

Study 4 investigated whether the intuitive distribution resembles the actual distribution in a familiar context: credit scores. The actual distribution of credit scores is far from normal; depending on the population, the distribution may be monotonously sloping down (age < 30), U-shaped (ages 40–49), or monotonously sloping up (age > 70). Although we incentivized participants to generate distributions for one of the age groups as accurately as possible, their responses still strayed from reality. More importantly, and consistent with our predictions, participants both indicated that they had general knowledge about credit scores and generated distributions with peaks, suggesting an overgeneralization of the bell curve even when the actual distribution is neither flat nor bell-shaped.

In sum, this research finds that people with limited knowledge about a specification intuitively generate uniform distributions, and the distributions become more peaked as familiarity increases. This finding has important implications for the estimation of consumers' beliefs and the presentation of new information in marketing.

Politics at the Mall: The Moral Foundations of Boycotts

Daniel Fernandes, Catholic University of Portugal, Portugal

EXTENDED ABSTRACT

This article examines the effect of political ideology on intentional buying and abstention from buying specific products for political reasons—buycotting and boycotting, respectively. Conservative and liberal ideologies describe a set of norms and ideals that shape individuals' thoughts, feelings, and actions (Jost et al. 2003) and represent a large part of consumers' identity (Ordabayeva and Fernandes 2018). Recent research shows that liberals are more likely than conservatives to boycott and to buycott (Endres and Panagopoulos 2017; Jost, Langer, and Singh 2017), which Jost, Langer, and Singh (2017) argue stems from liberals' tendency to question, challenge, and criticize existing institutions and authorities.

Building on moral foundations theory, this article examines when and why liberals and conservatives are more likely to boycott and buycott firms and products. Across seven studies, I find that these actions are influenced by unique moral concerns. Liberals engage in consumer political actions that are associated with moral values of harm and fairness (individualizing moral values), whereas conservatives engage in consumer political actions that are associated with moral values of authority, loyalty, and purity (binding moral values). Individuals of both political persuasions are more likely to boycott and buycott specific firms and products that oppose or support their moral concerns. The results also show that liberals' heightened tendency to boycott and buycott stems from their greater endorsement of harm and fairness moral values. The greater concern for the suffering of others and unfair treatment drives liberals to extend their moral regard to more permeable groups and individuals, and increases their support for consumer political activism that advances individual rights and well-being.

Study 1: Political Ideology and Nike Boycotts and Buycotts

Study 1 examines the intention to boycott and buycott Nike because of its campaign featuring Colin Kaepernick, who protested against police brutality toward African Americans by refusing to stand during the national anthem.

Method

Two-hundred seven American Mechanical Turk (MTurk) workers participated in the study (M_{age} = 36 years; 37% female). Participants answered a multi-item scale of political ideology (Kidwell, Farmer, and Hardesty 2013; M = 4.19, SD = 1.56; α = .75). Higher scores reflect more conservatism.

Participants answered how likely they were to boycott and to purposefully buy the products of the company (from 1 = "not at all" to 11 = "very much"; boycott: M = 6.19, SD = 3.63; buycott: M = 6.04, SD = 3.45).

Results

I regressed the intention of boycotting and buycotting Nike on political ideology (higher scores means more conservatism), which resulted in the expected significant positive effect on boycotting (B = .61, SE = .16, p < .001) and negative effect on buycotting (B = −.64, SE = .15, p < .001).

Study 2: Political Ideology and Willingness to Boycott and Buycott

Study 2 aims to test the effect of political ideology on boycotting and buycotting across multiple recent boycotts. In addition, it tests the mechanism for these effects. Liberals and conservatives are expected to engage in boycotts and buycotts that are associated with their moral values.

Method

Three-hundred eighty-five Prolific Academic workers participated in the study (M_{age} = 32 years; 52% female). They answered a single-item scale of political ideology (from 1 = "extremely left-wing" to 9 = "extremely right-wing"; M = 4.26, SD = 1.54). Participants then answered whether they would boycott, buycott, or neither boycott nor buycott to 14 conservative boycotts and 14 liberal boycotts in counterbalanced order.

Participants then answered the 22-item version of the moral foundations questionnaire (Graham, Haidt, and Nosek 2009). I averaged the evaluations related to the individualizing dimensions (α = .80; M = 4.34, SD = .63), as well as the binding dimensions (α = .83; M = 3.35, SD = .73).

Results

I regressed each measure on the single-item scale of political ideology and found, as expected, significant negative effects on both boycotting in liberal boycotts (B = −.71, SE = .12, p < .001) and buycotting in conservative boycotts (B = −.71, SE = .11, p < .001), and significant positive effects on both boycotting in conservative boycotts (B = .38, SE = .07, p < .001) and buycotting in liberal boycotts (B = .19, SE = .07, p < .01).

As expected, political ideology was negatively related to individualizing moral values (B = −.08, SE = .02, p < .001) and positively related to binding moral values (B = .16, SE = .02, p < .001). I then included the individualizing and the binding moral values in the model predicting the number of boycotts and buycotts, controlling for political ideology. The individualizing moral values predicted boycotting in the liberal boycotts (B = 2.26, SE = .28, p < .001) and buycotting in the conservative boycotts (B = 1.88, SE = .25, p < .001), but not boycotting in the conservative boycotts (p = .16) nor buycotting in the liberal boycotts (p = .12). In contrast, the binding moral values predicted boycotting in the conservative boycotts (B = .49, SE = .14, p < .001) and buycotting in the liberal boycotts (B = .44, SE = .15, p < .01), but not boycotting in the liberal boycotts (p = .68) nor buycotting in the conservative boycotts (p = .20). These results show that individualizing moral values predict support for liberal boycotts and opposition for conservative boycotts, whereas binding moral values predict support for conservative boycotts and opposition for liberal boycotts.

Study 3: Political Ideology and Attitude toward Boycotts

Study 3 aims to test the mechanism of the effect of political ideology. The greater alignment with individualizing moral values would mediate the effect of political ideology on attitude toward boycotts, which would further lead to the likelihood of boycotting and buycotting.

Method

Seven-hundred ninety-one American MTurk workers participated in the study (M_{age} = 36 years; 57% female). Participants answered the same multi-item scale of political ideology as in Study 1 (Kidwell, Farmer, and Hardesty 2013; M = 4.05, SD = 1.84; α = .81). Higher scores reflect more conservatism.

Participants then answered the same 22-item version of the moral foundations questionnaire (Graham, Haidt, and Nosek 2009) as in Study 2. I averaged the evaluations related to the individualizing dimensions (α = .83; M = 4.37, SD = .75) and the evaluations related to the binding dimensions (α = .90; M = 3.25, SD = .96).

Next, the attitude toward boycotting scale was administered (Sen et al. 2001; α = .93; M = 4.52, SD = 1.47) ("very negative/very positive," "not at all favorable/very favorable," "very bad idea/very good idea," and "not at all useful/very useful"). Participants also answered whether they have boycotted and buycotted in the past (0 = no, 1 = yes) to compose measures of likelihood of having boycotted (M = .31, SD = .46) and buycotted (M = .20, SD = .40) in the past.

Results

I logistically regressed the likelihood of having boycotted and buycotted on the multi-item scale of political ideology and found, as expected, significant negative effects on both boycotting (B = −.186, SE = .045, Wald χ^2 = 17.15, p < .001) and buycotting (B = −.123, SE = .051, Wald χ^2 = 5.79, p = .02). These effects were qualified by a quadratic term (boycotting: B = .119, SE = .019, Wald χ^2 = 38.50, p < .001; buycotting: B = .054, SE = .021, Wald χ^2 = 6.25, p = .01).

As expected, political ideology negatively predicted attitude toward boycotting (B = −.248, SE = .027, p < .001). This effect was also qualified by a quadratic term (B = .039, SE = .012, p = .001).

Next, I examined the serial mediation process of political ideology on boycotting and buycotting through individualizing moral values and attitudes toward boycotting. As in Study 2, political ideology was negatively related to the individualizing dimension (B = −.14, SE = .01, p < .001) and positively related to the binding dimension (B = .22, SE = .02, p < .001). I then included the individualizing and the binding moral dimensions separately in the model predicting attitude toward boycotting, controlling for the effect of political ideology. The results show a significant effect of the individualizing dimension (B = .41, SE = .07, p < .001) but not of the binding dimension (p = .86). I then included the attitude toward boycotting scale in the models predicting boycotting and buycotting, controlling for the effects of political ideology and of individualizing moral values. The results show significant effects of attitude toward boycotting on both boycotting (B = .746, SE = .076, Wald χ^2 = 96.24, p < .001) and buycotting (B = .506, SE = .078, Wald χ^2 = 41.84, p < .001).

The results show indirect effects of political ideology on boycotting (a = −.044, SE = .010, 95% CI = [−.065, −.027]) and buycotting (a = −.030, SE = .007, 95% CI = [−.046, −.017]) likelihood.

Study 4: Political Ideology and Boycotting Around the World

The main goal of Study 4 is to test the link between political ideology and boycotting around the world in the World Values Survey (WVS) (N = 224,874).

The WVS assesses political ideology using a single item from 1 = "left-wing" to 10 = "right-wing" (M = 5.70, SD = 2.38).

Respondents answered whether they have joined or considered joining boycotts (recoded as: 1 = "would never do," 2 = "might do," and 3 = "have done"; M = 1.49; SD = .66).

Results

I constructed a multilevel model, adjusting the intercept of propensity of boycotting in each nation. The results show an effect of right-wing orientation (B = −.018, SE = .0006, p < .001) and of its quadratic term (B = .003, SE = .0002, p < .001).

Study 5: The Effect of Manipulated Political Ideology

Study 5 tests the causal effect of political ideology on attitude toward boycotting.

Method

Three hundred ninety-seven participants recruited from Prolific Academic (M_{age} = 30 years; 45% female) completed the study. Only complete questionnaires were considered. To manipulate political ideology, I used the procedure developed by Ordabayeva and Fernandes (2018): Participants performed a recall task in which they described a conversation they had with someone who was either more conservative or liberal than they are. The rationale is that by comparing oneself to someone who is more liberal (vs. conservative), participants would perceive themselves as being more conservative (vs. liberal), building on the assumption that the social contrast influences individuals' perceptions of their political identity (Feinberg et al. 2017). After the recall task, participants indicated their ideology as a manipulation check.

Participants then answered whether they have already boycotted in the past (yes/no; 40% answered yes) and their attitude toward boycotting, as in Study 1 (Sen et al. 2001; α = .94; M = 4.20, SD = 1.47). Finally, participants answered the multi-item scale of political ideology as in Study 1 (Kidwell, Farmer, and Hardesty 2013; α = .70; M = 3.53, SD = 1.40). Seven participants scored more than 3 SDs on the multi-item scale of political ideology and were therefore not considered.

Results

The manipulation check confirmed that the conservative recall task led to more conservative ideology (M = 4.08) than the liberal task (M = 3.72, $F(1, 388)$ = 3.94, p = .048). I also observed a significant effect of the manipulation on the multi-item scale of political ideology (liberal: M = 3.35, conservative: M = 3.71; $F(1, 388)$ = 6.61, p = .01).

An analysis of variance on attitude toward boycotting with the ideology manipulation as a fixed factor revealed a marginally significant effect: opinions about boycotting were significantly more positive in the liberal (M = 4.34) than in the conservative condition (M = 4.06, $F(1, 388)$ = 3.60, p = .058). This effect was not qualified by whether participants had already boycotted in the past (p = .63).

Study 6: The Effect of Political Ideology on Political Activism

Study 6 tests the effect of political ideology on political activism (i.e., participation in political protests).

Method

I obtained the data set from the Measuring Morality Project of Duke University (https://kenan.ethics.duke.edu/attitudes/resources/measuring-morality/). Respondents indicated their political ideology on a seven-point scale (1 = "extremely liberal," and 7 = "extremely conservative"; M = 4.21, SD = 1.46). They also indicated whether they have attended a political protest or rally in the past 12 months (1 = yes, 0 = no; M = .04, SD = .20). 1,474 respondents answered both the political ideology and the political activism measures.

Results

I logistically regressed political activism on political ideology and found a marginally significant effect (B = −.16, SE = .09, Wald χ^2 = 3.11, p = .078), qualified by a quadratic term (B = .16, SE = .04, Wald χ^2 = 12.88, p < .001). The positive sign of this effect shows that the negative effect of political ideology is stronger among those who score at the low end of the scale (i.e., liberals).

Study 7: Political Ideology and Google Searches

Study 7 tests whether the effect of political ideology extends to online searches of conservative and liberal U.S. counties. I extracted the search index from Google Trends (from 0 to 100) and obtained political ideology using Tausanovitch and Warshaw's (2014) city-level score of conservatism. I then matched search index and political ideology for 107 cities. One search index for boycott and two search indexes for buycott were 3 SDs from the mean and were therefore not considered. The search index for boycott (M = 62.75, SD = 8.43) was more pronounced than for buycott (M = 7.30, SD = 13.59; F(1, 103) = 1,419.04, p < .001).

Conservatism in a given city is negatively related to the search level for the term "boycott" in that area (B = −6.71, SE = 2.94, p = .025) and for the term "buycott" in that area (B = −25.21, SE = 4.20, p < .01), which suggests that the prevalence of liberals in a given city predicts interest in boycott and buycott in that city.

General Discussion

This research finds that political ideology affects consumers' attitudes, interest, and actions toward boycotting and buycotting, identifying when and why liberals and conservatives engage in these behaviors. Seven studies show that liberals and conservatives engage in boycotts and buycotts that are associated with their unique moral values. In addition, individualizing moral values predict a more positive attitude toward boycotts, and this explains the greater tendency of liberals to boycott and buycott.

Disruptive Consumption: How Consumers Challenge Mainstream Markets Through Makeshifting

Marcia Christina Ferreira, Brunel University London, UK

EXTENDED ABSTRACT

This study aims to unpack makeshifting, an understudied, yet widespread, consumption practice whereby consumers use materials, parts and objects at hand to adjust, improve, or invent solutions to their needs and desires for goods or services that are sometimes not available or existing in their markets. Around the world, culture-specific terms analogous to makeshifting are found: bodge (UK), tapullo (Italy), urawaza (Japan), jua kali (Kenya), jugaad (India), and gambiarra (Brazil). Although prior research has investigated do-it-yourself (DIY) and craft behaviors (Wolf and McQuitty, 2013; Moisio, Arnould and Gentry, 2013), it has overlooked the specific ways in which consumers apply their creativity to bypass market-mediated offers to design and produce their own solutions.

Often associated with improvised solutions that address people's immediate needs (Boufleur, 2006), makeshifting is a sustainable practice because it reduces waste disposal. Sustainable consumption initiatives are grounded on three key actions: reduce, reuse and recycle (3Rs). Considerable research has been devoted to understanding reducing (e.g. boycott, frugality) and recycling as environmentally friendly consumer behaviours (McDonagh and Prothero, 2014), but less attention has been paid to reuse practices (Lee, Roux, Cherrier and Cova, 2011). Makeshifting fits in the reuse category, because consumers creatively reprocess their waste and idle objects to produce alternative products. More importantly, many makeshifts have universal utility, are easily replicable and can fully replace commercial products. Hence this practice can improve quality of life while minimizing the use of natural resources.

A limited view of makeshifting as "quick fix" solutions neglects the creativity and resourcefulness employed by individuals in reusing materials, parts and objects at hand to challenge mainstream marketing by adjusting, improving, and inventing solutions that fit consumers' unique material, social, and cultural motivations. As makeshifting blurs the boundary between production and consumption, it empowers consumers to challenge mainstream markets, rejecting their commercial offerings, while addressing consumption needs. To further examine this phenomenon, we ask: *What is the nature of the makeshifting practice? How does it help consumers disrupt conventional consumption practices? What are its consequences for the market and for sustainable consumption?*

To address these questions, we conducted a netnography (Kozinets, 2015) of the Brazilian makeshifting practice, popularly known as gambiarra. We immersed ourselves in multiple online platforms where Gambiarra was shared and discussed by consumers, collecting and qualitatively analyzing visual and textual data.

Prior research has noted that understanding the dynamics of social practices (i.e. how they emerge, are sustained, and become naturalized) might shed light on contemporary social problems such as environmental issues, or persistent patterns of inequality (Shove, Pantzar and Watson, 2012). As such, practice theories provide an adequate theoretical lens through which to analyse makeshifting, and a useful framework to reflect on this phenomenon, its relation to sustainable consumption, and its implications for public policies (Welch and Warde, 2015).

Findings

Consumers may re-signify market resources, second-hand resources, or even waste in creating makeshift solutions. Material inputs can be repurposed in combination (e.g. used coffee pods [repurposed] and new electrical supplies [repurposed] are combined to produce Christmas tree lighting), or in isolation (e.g., a hair dryer [repurposed] is used to efficiently glue eyelash extensions). Gambiarra, then, endows objects, components and procedures with new meanings.

Gambiarra is driven by several non-mutually exclusive factors, such as resource limitations, lack of access to markets, sustainability values, an anti-consumption ideology, a desire for social recognition, personalization (crafting), and artistic expression (junk art). Gambiarra, then, is a practice that is sustained by a complex nexus of teleoaffective structures. Furthermore, individuals with multiple levels of competence and planning can engage in gambiarra and have successful results. Gambiarra might emerge as a completely improvised practice at a moment of need; or as an extremely planned solution. Parallel to this improvised-planned continuum, gambiarra may be performed by both practitioners who have high technical competence, or those who have none. Finally, consumers may determine whether a given practice or solution is gambiarra or not, according to their own values. Often, the same practice or solution is considered differently by different consumers. For example, using a power cable to connect several light bulbs may be explained as gambiarra by an electrician, or introduced as an artistic and affordable DIY decoration solution by an amateur party planner. This signals the ambiguous and conflicting meanings of gambiarra, as either negative transgression, or positive ingenuity. Often, this distinction indicates an aesthetic polarization between the ugly, unskillful transgression and the beautiful artistic solution.

All in all, our findings indicate that gambiarra is a practice without routine. That means, gambiarra is neither an integrative nor a dispersive but instead a disruptive practice that finds in object transformation its crucial drive. If rules represent one of the links of the practice nexus (Schatzki, 1996), in makeshifting it is precisely the absence of rules that characterizes the practice. In addition to the absence of rules, gambiarra can be considered a disruptive practice because disruption may occur in the process, but also in the object's materiality and functionality.

Just As Real As It Seems: Managing The Undesirable Consequences of Unethical Consumption Behaviour

Marcia Christina Ferreira, Brunel University London, UK
Pauline Maclaran, Royal Holloway, University of London, UK

EXTENDED ABSTRACT

Although considerable research has been devoted to ethical consumption (Belk, Devinney, and Eckhardt 2006; Bray, Johns, and Kilburn 2011; Hiller 2019; McDonagh and Prothero 2014), rather less attention has been paid to what happens when consumers misbehave. Counterfeit goods are seen by many as a questionable consumption choice so people engaging in this practice must deal with the consequences of their behaviour, like physical hazards, financial losses, and social embarrassment to name a few. Hence this is a risky consumption practice whose products' materiality can promptly denounce the consumer's misbehaviour. Therefore further investigation is needed in order to understand how materiality and risk converge shaping consumers' experiences around counterfeit goods. To address this gap this article draws on literature from the fields of risk and materiality to conduct an interpretive study that investigates how consumers avert the materialization of their risky behaviour to enjoy the consumption of counterfeits whilst protecting their integrity. In doing so, it contributes to a growing number of consumer studies (Crockett 2017; Luedicke 2015; Saatcioglu and Ozanne 2013; Veresiu and Giesler 2018) examining macro-social contexts beyond celebratory self-actualization narratives (Askegaard and Linnet 2011).

Literature. Early on, consumer behaviour studies framed the consumption of counterfeits as 'risky' behaviour (Bloch, Bush, and Campbell 1993). However risk judgements cannot be isolated from the context in which they arise (Lupton 1999b), especially in plentiful markets of counterfeits (Gentry et al. 2001) where the consumption of these products is somehow seen as socially acceptable across social classes (Kravets and Sandikci 2014; Kuever 2014; Pinheiro-Machado 2010). Thus, rather than simply measuring consumers' ethical attitude towards counterfeit goods (Latif, Yiğit, and Kirezli 2018; Staake, Thiesse, and Fleisch 2009) it is important to consider that risk works as a cultural strategy that is employed by social groups—like consumers of counterfeits—to make sense of the uncertainties in society (Douglas 1982; 1992); such as actual hazards, the transgression of social norms (Tansey and O'Riordan 1999), issues of trust (Lupton 1999a) and judgements made with regard to objects and behaviours that are deemed improper, impure or just 'wrong' (Douglas 1966).

Knowledge of materiality is also of great importance, especially when considering that clothing consumption is the largest and most visible of the counterfeiting businesses (Hardy 2014). However, apart from a few studies that discussed the consumption of counterfeits as vehicles for self-expression (Ahuvia et al. 2012; Hoe, Hogg, and Hart 2003; Perez, Castaño, and Quintanilla 2010; Strehlau 2005) previous studies have not fully addressed the importance of fashion in the consumption of counterfeits, thereby neglecting consumers who may see counterfeits as fashion products that are used in combination with many others. It is worth exploring then, the importance of material aspects of fashion products to consumers, including counterfeits, in creating their outfits (Barthes 1967). This will help to understand how consumers blend counterfeits and genuine goods (Kravets and Sandikci 2014), and without risking their social identity.

Theoretical approaches to materiality investigate the ways in which objects are situated in people's lives (Tilley 2006) thus they are frequently understood through the lens of material embeddedness (Schatzki 2010; Woodward 2007) and can be studied as the process of objectification (Miller 1987; 2005). Latest advances in the field updated the concept of material embodiment from the materialisation of cultural ideas (Tilley 2006) towards the notion of productive material interaction (Borgerson 2013; Dant 2008; Ingold 2007; Woodward 2011); an unfolding chain of interactions not only between the subject and the finished object but also between the subject and the object's material components (as seen in Ferreira and Scaraboto 2016). Therefore productive material interaction is a useful concept to explore the meanings that arise when consumers interact with products that are similar in their fashion design but materially distinct.

Methodology

This interpretive research adopts *grounded theory* as a research strategy (Glaser and Strauss 1967), leveraging the fact that this approach allows for a 'detailed investigation of patterns of behaviour that is both relevant and problematic to those being studied' (Goulding 2002, 85). Principles of theoretical sampling were applied to the selection of the informants in this study; in total 42 consumers of counterfeits were interviewed.

Findings

The study offers three contributions to the literature. Firstly, it resorts to the literature on materiality to demonstrate that it is only through productive material interactions that counterfeits become meaningful to consumers. This happens because consumers need to rework their counterfeits not only symbolically but also physically, whilst in the consumption of genuine products meanings are reworked only symbolically. They re-contextualise the use of their counterfeits taking fashion as a blueprint to communicate the desired meaning. But the novelty presented here is that other objects and materials are strategically incorporated into their fashion ensemble and so consumers materialise their entire outfit. This leads to an sophisticated process of materialisation in which counterfeits become very interesting, and even alluring to many consumers.

Secondly the analysis within the risk theme has shown that although consumers do not feel ashamed of their choice, they do take the implications of their actions seriously. To avoid having their social identity challenged by others they need to manage the risk beyond common situations. Therefore they not only look for (dis)similarities, but also seek the purest counterfeits they can find, as evidenced during fieldwork the practice of thoroughly examining these products internally such as the scrutiny of handbags linings, trainers insole and clothes interior seams. Further, risk management is an endless practice with consumers caring for their products over their lifespan. They seek to prevent *symbolic pollution* (Douglas 1966) and thus worn, dingy and torn counterfeits have no place in their lives.

Lastly, as it can be fairly easy to find not only counterfeits but also 'inspired' imitations in emerging markets, consumers must deal with an abundance of similar products sold alongside non-branded and mundane products in popular marketplaces. Thus they employ four consumption strategies where materiality and risk intersect allowing consumers to avert the materialization of their risky behaviour hence managing the undesirable consequences of their unethical behaviour. Nevertheless counterfeits will never be risk free. Some

consumers may have fun and even joke about them but this does not change the fact that for a meaningful consumption experience they must implement at least one of these four strategies to protect their social identity whilst enjoying their consumption experiences around counterfeit goods.

The Neglect of Positive Aspects in Novel Food Products

Arnd Florack, University of Vienna, Austria
Teresa Koch, University of Vienna, Austria
Simona Haasova, University of Lausanne, Switzerland
Hans Alves, University of Cologne, Germany

EXTENDED ABSTRACT

Today's marketing trend is to design products that are very similar to the already existing ones, but made healthier with a special ingredients composition (e.g., Beyond Meat burgers). The current research investigates how consumers compare innovative food alternatives with existing ones and form their purchase intentions and tastiness expectations.

A basic principle that can be used to form hypotheses about the formation of expectations towards novel alternatives is the cue overlap principle of differentiation, which has recently been studied in social psychology to explain the formation of attitudes towards individuals and groups (Alves et al., 2018). The cue overlap principle states that when comparing two items that were introduced at different points in time, individuals focus on the distinct attributes of the newer item, which tend to be negative, just because negative attributes are more diverse than positive attributes, which are often similar and shared between objects (Alves et al., 2017). We suggest that also novel products will be evaluated relative to familiar ones and that the predicted differences hold for products as well (Houston et al., 1989; Hodges, 2005). In essence, the cue overlap principle of differentiation predicts that novel products are evaluated based on distinct attributes that differentiate them from existing ones, and that such distinct attributes are usually negative, while there is a neglect of shared, often positive, attributes by novel and existing products.

In Study 1 (N = 146), participants indicated two positive and two negative attributes of a classic burger and a novel healthier alternative (presented as the Volumetrics concept, Rolls & Hermann, 2012), subsequently rating whether each attribute would apply to both or just one of the burgers. In line with our hypothesis, consumers regarded more of the positive attributes than of the negative attributes to be applicable to both products, $(F(1, 145) = 17.892, p < .000, = .110$; for all results see Table 1), supporting the basic assumption that in consumers' perception, standard products and healthier alternatives often share positive, but have distinct negative characteristics.

Study 2 (N = 250) aimed to illustrate that the pattern observed in Study 1 causes a challenge for the introduction of healthy products. Here and in all following studies, participants received descriptions for two burgers, first a classic burger and subsequently a novel, healthier burger. These contained three positive (e.g., juicy, fresh, crispy) and three negative attributes (e.g., hard, soggy, boring), randomly selected from sets of six. For example: "Dish: *Classic Burger* – Customers often describe this burger as: *juicy*." We experimentally varied whether positive or negative attributes were overlapping (applied to both burgers) or were distinct (different for each burger). After each burger description, participants rated their purchase intentions with two 1-7 scale items, and their taste expectations using two 1-10 scale items. The results were in line with our hypotheses that overlapping attributes are cancelled out while the distinct attributes of the novel alternative impact evaluations. Consumers expected a novel healthier food to be less tasty $(F(1, 248) = 15.34, p < .001, = .06)$ and indicated lower purchase intentions for this option $(F(1, 248) = 10.49, p = .001, = .04)$ when the positive attributes between the two burgers were shared vs. when the negative attributes were shared.

Study 3 (N = 338) tested whether the cue overlap effect can be mitigated when synonyms are used to describe the attributes, which may constitute a vital strategy to advertise novel food. We used the same procedure as Study 2, however, in one of the conditions, the attribute overlap was realized with synonyms, based on a pretest (e.g., gentle – mild). Study 3 provides little evidence that using synonyms helps to prevent an undesired cancellation of positive attributes of a novel food product (taste expectations: $F(1, 334) = .46, p = .499, = .00$; purchase intentions: $F(1, 334) = .05, p = .825, = .00)$.

In Study 4 ($N = 282$), we studied whether the experimentally varied overlap of positive or negative attributes is reflected in the cognitive responses of the consumers (focus on non-overlapping attributes). We applied the design of Study 2 and added a thought-listing task (Cacioppo, Von Hippel, & Ernst, 1997), where participants listed their thoughts and indicated for each whether it represented an advantage/disadvantage for the novel/classic burger. In line with our expectations, consumers listed more positive thoughts about the novel product when negative aspects were shared vs. when positive aspects were shared $(F(1, 280) = 8.06, p = .005, = .03)$.

In Study 5 ($N = 289$), we explored whether the cue overlap effect can be mitigated when all information are presented simultaneously as indicated by previous literature (Bruine de Bruin & Keren, 2003). We applied the design of Study 2, however, now both burgers (varied position: left and right) and all the attributes were presented simultaneously. We measured taste expectations and purchase intentions with 1-11 scale items reflecting a preference for one or the other burger. We did not find the cue overlap effect on taste expectations $(F(1, 146) = 2.15, p = .144, = .01)$ and purchase intentions $(F(1, 146) = .38, p = .54, = .00)$ when the novel burger was presented on the left and the classic on the right. When presented reversedly, however, the pattern was similar (although not significant) to previous studies. Hence, presenting the novel product and the standard product simultaneously, the novel product being on the left, might help marketers to reduce the undesired cue overalp effect.

In line with the cue overlap principle of differentiation, we show that consumers do not rely on positive aspects that apply to both an existing and a novel food product when they form their evaluations of the novel product. Instead, they evaluate a novel food product primarily based on those attributes that differentiate it from existing ones. This phenomenon represents an undesired barrier for the introduction of novel foods because they are likely to share positive attributes with existing products, and are highly likely to be differentiated with negative attributes (Study 1). Marketing managers should rather stress the positive distinctiveness of the novel food alternatives and not focus on the positive similarities, likely to be neglected.

Rage Against the Machine: When Consumers Sabotage Robots in the Marketplace

Darima Fotheringham, W. P. Carey School of Business, Arizona State University, USA
Monika Lisjak, W. P. Carey School of Business, Arizona State University, USA
Kirk Kristofferson, Ivey Business School, Western University, Canada

EXTENDED ABSTRACT

Companies are increasingly deploying AI-enabled technology to perform service roles (Whiton, 2019). However, multiple media reports document incidents where consumers sabotaged service robots. Considering the potential benefits of deploying service robots (e.g., efficiency, safety during times of pandemic, Litwin, 2020), and the cost required for their implementation (Demaitre, 2019; Whiton, 2019), it is critical to understand consumer sabotage behavior against robots.

The current research seeks to uncover when and why consumers are more likely to engage in acts of sabotage against robots and proposes that a key factor driving such sabotage behavior is robot's human likeness (MacDorman & Ishiguro, 2006; Mori et al., 2012). Interestingly, one could make different predictions as to how robot human likeness might influence sabotage. One possibility is that consumers might be more likely to feel socially connected to robots high (vs. low) in human likeness (Epley et al., 2007, 2008), and less likely to sabotage them because doing so would violate acceptable social norms of behavior (Ackroyd & Thompson, 1999). In contrast to this possibility, we propose that consumers are more likely to sabotage robots high (vs. low) in human likeness because such robots blur the boundaries between technology and humanity, undermining the distinctiveness of humanity as an in-group. This is consistent with the uncanny valley hypothesis, which suggests that robots high in human likeness cause discomfort (Mori et al., 2012), which leads to avoidance (Strait et al., 2017) and compensatory consumption (Mende et al., 2019)robots with a human-like morphology such as a face, arms, and legs. We identify a specific source of discomfort, threat to in-group distinctiveness (Brewer, 2003), and examine a novel consequence of this threat, consumer sabotage.

In study 1 we created a secondary dataset of real-world stimuli documenting sabotaging behavior against robots. Participants (N = 204) were presented with one incident at a time, and evaluated human likeness of the robot and the degree of the incident's violence. The degree of human likeness of the robot was positively correlated with the severity of robot sabotage behavior (r(2,222) =.32, p < .001), providing preliminary real-world evidence for the effect.

In study 2 (N = 261), human likeness was manipulated. Undergraduate participants learned that they would be assisting in the training of a robot prototype, which was manipulated to be either high or low in human likeness. Participants were instructed to answer five open-ended questions purportedly to provide language training content, while told that the robot was best able to understand short responses, and that longer responses could harm it. Thus, participants could sabotage the robot by providing long responses. We measured (1) behavioral sabotage by computing the average number of words participants wrote and (2) attitudinal sabotage by assessing hostility toward the robot. Participants who interacted with the robot high (vs. low) in human likeness were more likely to behaviorally sabotage its training (p = .030), and expressed greater hostility towards the robot (p = .023).

In study 3 (N=152), we triangulated on the robot human likeness construct by both manipulating robot human likeness and measuring individual differences in the tendency to anthropomorphize technology (Waytz et al., 2010). Participants watched a video clip of a coffee shop interaction with a barista robot that was either high or low in human likeness. Following Kähr et al. (2016)companies have been confronted with a new type of negative consumer behavior: consumers who have turned hostile and who are strongly determined to cause damage to the brand. Empowered by new technological possibilities, an individual consumer can now wreak havoc on a brand with relatively little effort. In reflection of this new phenomenon, the authors introduce the concept of consumer brand sabotage (CBS, we assessed consumer sabotage by asking participants the likelihood to (1) complain about the robot, (2) publish negative videos or posts about the robot on social media, and (3) make snide comments about the robot to others. We replicated the main effect of robot human likeness on sabotage behavior (p = .030). Importantly, we observed a human likeness × anthropomorphism interaction (p = .028), such that the focal sabotage effect emerged among those who perceive technology as human like (BJN = 4.03 and higher on a 10-point scale).

In study 4 (N = 400), we tested the mediating role of in-group distinctiveness threat. Participants were presented with the same stimuli and sabotage measure used in study 3. Next, we assessed distinctiveness threat by asking participants the extent to which the barista robot would make them feel that the robot: (1) blurred the boundary between humans and robots, (2) reduced the distinction between humans and robots in a dangerous way, and (3) threatened the difference between humans and robots (Warner et al., 2007). Again, we found that participants were more likely to sabotage the robot when human likeness was high versus low (p = .038). Participants also experienced higher distinctiveness threat when the robot's human likeness was high versus low (p = .002). Mediation analysis (model 4, 10,000 resamples) revealed that distinctiveness threat fully mediated the effect of robot human likeness on sabotage (CI95: .05, .25).

Study 5 (N = 600) provided further support for the proposed process by examining a theoretically driven moderator, individual difference in expansiveness of in-group boundaries. We reasoned that if the observed robot sabotage is a result of viewing a robot with high human likeness as a threat to in-group distinctiveness, then the sabotage effect should be attenuated among consumers with more expansive group membership boundaries. After presenting a video of a robot grocery delivery worker either high or low in human likeness, we assessed participants' sabotage intention and individual differences in expansiveness of in-group boundaries using moral identity scale (Aquino & Reed, 2002) as consistent with prior literature (Choi & Winterich, 2013). Participants were more likely to sabotage a robot high (vs. low) in human likeness (p = .007). Importantly, the predicted robot human likeness × expansiveness of in-group boundaries interaction emerged (p = .050), such that the sabotage effect was attenuated among participants with more expansive in-group boundaries (BJN = 5.35 and higher on a 7-point scale).

This research contributes to the emergent literature on the effect of AI-based technologies on consumer behavior (Castelo et al., 2019; Granulo et al., 2019; Longoni et al., 2019; Mende et al., 2019) despite the fact that algorithms often perform better. The authors explore when and why this is true in a wide variety of domains. They find that algorithms are trusted and relied on less for tasks that seem subjective (vs. objective by identifying robot sabotage as a new and costly consequence of using robots in the marketplace, and by examining when and why robot sabotage occurs.

Does it Pay to Offend? Short and Long-Term Responses to Offensive Ads

Friedmann, E., Solodoha, E., and Efrat-Treister, D., Ben Gurion University, Israel

EXTENDED ABSTRACT

Offensive stereotyping advertising that insults low power groups (women, blacks) is increasing worldwide (EASA-Alliance 2017). Most empirical research on the influence of offensive ads shows immediate negative consumer responses to offensive ads (Rojas-Méndez et al. 2009). This highlights a discrepancy between literature that claims for negative responses to offensive ads, and their increasing use in practice. To understand this gap, we explore short and long-terms effect of their use, on consumer responses. We posit that over time, after offense recedes, a positive consumer response toward the brand appears in the long term, which we term the 'Time–Offense Paradox' (TOP). This is in line with the power approach theory (Keltner et al., 2003) that claims power is attractive. This theory, and the dimension of time, have not yet been applied to the context of offensive ads. We suggest the 'TOP' effect is triggered by a long-term positive increase in consumer response, especially among low-power group members, as compensatory consumption theory suggests (Rucker and Galinsky 2008), we term this the 'Trigger TOP effect'.

We begin with a real-world study examining a well-known beer that offends women in their advertisements; Study 1a investigated the 'TOP effect', 24 judges (50% women) evaluated 11 ads of the offensive beer whose marketing strategy is based on the theme "Thank God you're a man." Data on the brand's sales were acquired from 'Storenext'. Hierarchical regression examining the difference in daily sales before and after an offensive ad showed that ad's offensiveness predicts sales ($B=41.64$, $SE=9.07$, $p<.05$). Study 1b investigated the 'Trigger TOP effect'. A pretest ($n=287$, 66% women) examined the perceived offensiveness of six beer brands. The offensive beer from Study 1a was the most offensive [$M_{offense}=3.34$, $SD=.13$; $F(5,282)$ offense difference = 29.91 , $p<.001$]. Next, we show that choosing the offensive beer is most popular (30.9%) among women ($n=261$, 72.7% women). Among men, this brand was the second-favorite (21.3% chose it). Considering the two leading brands, choice and gender were related ($\chi^2 (1)=3.45$, $p<.05$).

A pretest ensured that (a) control ads differ from treatment ads in their perceived offensiveness and brand power, and that (b) low- and high-power groups (blacks vs. whites, females vs. males) indeed differ in social power.

In Study 2 we examined purchase intentions among 347 prolific participants (47.2% blacks), immediately after the offensive advertisement, and 10 days later. Respondents were exposed to racially offensive/non-offensive ads for soap, which was presented once, during the first phase of the study. Repeated-measures ANOVA with ad condition as the between-subjects factor and purchase intentions over time as the within-subjects factor showed a main effect of time since exposure on purchase intentions ($F(1,344)= 17.23$, $p<.001$), and an interaction between time since exposure and ad's condition ($F (1,344)=16.65$, $p<.001$). The results showed a positive effect of offense on purchase intentions 10 days after exposure to the ad in the treatment condition ($F(1,204)=30.72$, $p<.001$), but not in the control condition ($F(1,145)=.005$, $p=.95$). Repeated-measures ANOVAs for the treatment and control conditions, entering race as a between-subjects factor and purchase intentions at both time points as the within-subject factor showed an interaction of race by time since exposure influencing purchase intentions, in the offensive ad condition ($F(1,198)=4.01$, $p<.05$), and not in the control condition ($F(1,112)=1.73$, $p=.19$) revealing a steeper increase in purchase intentions over time in the low-power (compared with the high-power) group, illustrating the 'Trigger TOP effect'.

In study 3 we examined brand choice among male and female participants over four-time points (baseline, immediately, 10 days, one month). Students ($n= 221$, 65.6 % women) were randomly exposed to an offensive / non-offensive ad for Snickers, and were asked to choose one of the three chocolate bars (Snickers/ Mars/ Twix). The change between baseline and 10 days after exposure showed a marginally significant difference between control and treatment conditions ($\chi^2(2)=5.044$, $p=.08$). When examining the change between baseline and one month later, the effect of ad condition was significant ($\chi^2(2)=6.67$, $p<.05$). 70% of those who changed their choice to Snickers were from the treatment group. Binomial mixed regression was conducted to predict actual brand choice (Snickers or others). Time-since-exposure was computed as a dummy variable: baseline and a month after exposure. It was entered as predictor along with ad's condition and their interaction. Results showed that the treatment condition yielded higher Snickers choices than the control condition ($B_{time}=-.13$, $SE=.04$, $p<.01$; $B_{ad's-condition}=-.14$, $SE=.06$, $p<.05$; $B_{timeXad's-condition}=.22$, $SE=.05$, $p<.001$). A significant gender by time interaction was evident only in the treatment condition ($B_{gender}=-.13$, $SE=.07$, $p=n.s$; $B_{time}=-.01$, $SE=.05$, $p=n.s$; $B_{timeXgender}=.16$, $SE=.05$, $p<.001$).

Study 4 focused on the mechanism behind the long-term effect of offensive /non-offensive ads. 105 undergraduates (57.1% women, $M_{age}=25.43$, $SD=1.59$) rated three well-known beer brands. First, they chose one beer out of three. Then they recalled the slogans used by each brand. Next, they assessed perceived brand power (Anderson and Galinsky, 2006), and offensiveness of the ad. Results revealed a mediation effect only among women, in which Ad's offensiveness->Brand power->Brand attraction->Brand choice{effect =.01(.01), 95%, [.000, .042]} leading to an overall effect {effect =.007(.005), 95%, [.001,.022]}, illustrating the mechanism of the predicted effects.

Our contribution is by demonstrating the change in consumer reaction to offensive ads over time, and its mechanism. The positive TOP effect is triggered by approach to power among low-power groups. Regulation limiting the use of offensive ads is necessary to promote a more just society for all individuals.

The Review-Writing Effect: Writing a Review Amplifies Evaluations and Connections More Than Rating Does

Matthias Fuchs, University of St. Gallen, Switzerland
Gerald Häubl, University of Alberta, Canada

EXTENDED ABSTRACT

The era of ubiquitous consumer feedback solicitations is upon us: When buying products online, consuming meals in a canteen, or going through airport security, one would be hard-pressed not to be asked to constantly rate and review.

For managers, the appeal of constantly measuring consumers' satisfaction with their offerings seems clear. By better understanding what consumers think, they can react and improve their products and experiences. But is the same true for the consumer? Are quick and easy feedback requests advisable from a consumer perspective? In particular, how does writing reviews impact consumers' mental states when compared to rating the same product?

Prior work has shown writing to lead to a search for meaning and understanding through its syntax: Writing organizes memories by forcing writers to build causal structures into their disclosures (Lyubomirsky, Sousa, and Dickerhoof 2006; Singer 2004; Smyth, True, and Souto 2001). This constitutes the first hypothesized psychological process ignited by review-writing: Compared to rating, we argue that review-writing can increase evaluative clarity (i.e., consumers' clarity of their evaluation of a product or experience, based on "understanding" by Moore 2012), which in turn polarizes their views.

In addition to the first process, we propose that review-writing sets consumers' focus on the social aspect of the interaction. This phenomenon has been referred to as "interpersonal involvement" (Chafe and Danielewicz 1987; Jahandarie 1999; Tannen 1985) or "interaction focus" (Shen and Sengupta 2018). We hypothesize that interaction focus strengthens their connection to the producer (based on self-brand connection by Escalas 2004), which constitutes the second hypothesized psychological process ignited by review-writing: Compared to rating, we argue that review-writing may lead to a greater interaction focus, which induces a stronger connection to the producer, which increases retrospective enjoyment.

Lastly, we derive a theoretical moderator of the review-writing effect from global matching models of memory(Kelly and West 2017). According to these models, "human memory is a vast collection of episodic memory traces, each of which is a record of an event or experience" (Hintzman 1984, p. 96). Following this theory, review-writing should encode more memory traces than rating does. At the same time, the absolute number of extant memory traces associated with a product can conceptually be viewed as familiarity with the product (Dougherty, Gettys, and Ogden 1999). This leads us to our prediction that the review-writing effect will be less pronounced for familiar products and experiences.

The two psychological processes ignited by review-writing and their moderator, familiarity, are summarized in these hypotheses:

Hypothesis 1: *Review-writing increases retrospective enjoyment of the reviewed product or experience.*

Hypothesis 2: *The positive effect of review-writing on retrospective enjoyment (H1) is attenuated when consumers' familiarity with the product or experience is high.*

142 MTurk workers participated in study 1 in exchange for payment. Participants were randomly assigned to either the review-writing or the rating condition. Participants were asked to watch an enjoyable video ("Minions – The Competition"). While watching the video, they were asked to indicate their momentary enjoyment every 30 seconds. In the review-writing (rating) condition, participants read that the producer of the video is asking them for written (rated) feedback on the experience's systematic cues (Chaiken 1980; Petty and Cacioppo 1986), which were identified in a pre-study. As hypothesized, there was a significant effect of review-writing on retrospective enjoyment ($F (1, 138) = 2.43$, $p = .04$, using momentary enjoyment as a linear and quadratic covariate in this and all subsequent ANCOVAs, Estimated Marginal $M_{RevWrit} = 5.51$, $M_{Rating} = 5.20$).

244 MTurk workers participated in study 2 in exchange for payment, which was a 2 (review-writing or rating) × 2 (familiar or unfamiliar song) between-subjects study. In the unfamiliar song condition, study participants listened to the song "Loving is Easy" by the artist "Rex Orange County" and in the familiar song condition, participants listened to the song "Happy" by "Pharrell Williams". The study was identical to study 1 in all other aspects. A t-test revealed a significant difference in aided awareness between the popular and unpopular song ($M_{familiar} = 6.05$, $M_{unfamiliar} = 1.82$, $t(218)=23.066$, $p<.001$, no covariates). As hypothesized, a 2×2 ANCOVA revealed a significant interaction of review-writing and familiarity on retrospective enjoyment ($F(1, 238) = 6.12$, $p = .01$). In the unfamiliar condition, review-writing increased retrospective enjoyment ($M_{RevWrit}= 5.62$) versus rating ($M_{Rating} = 5.14$). In the familiar condition, review-writing did not influence retrospective enjoyment ($M_{RevWrit} = 5.53$) compared to rating ($M_{Rating} = 5.68$).

104 students at a Swiss university participated in study 3 in exchange for payment, which was a lab study. Participants tasted a mostly unfamiliar, foreign brand of jam. Study 3 differed from the previous studies in two ways: First, we used retrospective evaluation as an extension of our dependent variable. Second, at the end of the study, participants could choose to reduce their payment by 0.50 CHF ($ 0.53) and receive a 28g miniature jar of jam of the same brand (36% chose to purchase the jam). A 2×2 ANCOVA revealed that the effect of review-writing near-significantly interacted with previous awareness of the foreign brand ($F (1, 99) = 3.89$, $p = .05$). When participants were unfamiliar with the brand (M_{Fam}-SD_{Fam}), review-writing increased their retrospective evaluation ($M_{RevWrit} = 5.24$, $M_{Rating} = 4.94$). This effect subsided when participants were familiar with the brand ($M_{RevWrit} = 5.16$; $M_{Rating} = 5.06$). A logistic regression revealed that retrospective evaluation was a significant predictor of jam purchase ($b=.77$, $p<.01$). As retrospective evaluation increased by one unit, the probability of purchasing the jam increased by 68%.

This research features 4 major contributions: First, while previous research has focused on consumer feedback from the perspective of managers, we do so from the perspective of consumers. Second, this research more generally advances our understanding of how articulating one's views for others affects internal states. Third, this research extends the application of global matching models of human memory. Lastly, this research contributes by showing that also the mode of recording answers impacts mere measurement effects (not only measuring vs. not measuring).

Found, Not Created: How Unintentionality in an Object's Discovery Increases Preference

Alexander G. Fulmer, Yale University, USA
Taly Reich, Yale University, USA

EXTENDED ABSTRACT

Consumer research has increasingly identified biographical elements of an object's creation process as key inputs shaping preference for otherwise identical objects (Avery et al. 2010; Cho and Schwarz 2008; Fuchs, Schreier, and Van Osselaer 2015; Hong and Wyer 1989; Kruger et al. 2004; Newman and Bloom 2012; Newman, Gorlin, and Dhar 2014; Paharia et al. 2010; Reich, Kupor, and Smith 2017). Previous work has identified intentionality during the creation of objects as one such biographical element that can shift consumers' preferences for those objects (Newman and Bloom 2012; Newman et al. 2014; Reich et al. 2017). While past work has identified influences of intentionality during an object's creation on preference, the current research investigates preference for objects that are discovered, that is, existing objects that are uncovered. We propose that unintentionally discovered objects will be preferred to otherwise identical intentionally discovered objects. Further, we predict that this preference is driven by the unintentional discovery of an object prompting increased counterfactual thought about how the object might not have been discovered at all.

Past consumer research on intentionality behind actions and creation processes has showcased a premium awarded to outcomes and objects involving intentionality. There exists a psychological association between intention and effort (Caruso, Waytz, and Epley 2010; Heider 1958; Malle 2010; Malle and Knobe 1997), and multiple lines of consumer research have shown that objects that were believed to have taken more time and effort to create were valued more (Cho and Schwarz 2008; Kruger et al. 2004; Morales 2005). Other work on intentionality indicates that skill is assumed in intentional action (Malle 2010) and that people make negative inferences and believe an agent holds less skill and has exerted less effort if their actions are unintentional rather than intentional (Caruso et al. 2010; Malle 2010; Malle and Knobe 1997). Taken together, these findings imply that intentionally discovered objects will be preferred to unintentionally discovered objects.

However, research has illuminated situations in which specific kinds of unintentionality during an object's creation process actually increase preference for objects. Mistakes involved in the manufacture of hedonic products (Reich et al. 2017), unintentionally making a product environmentally friendly (Newman et al. 2014), and coincidence in the duplication of original artwork (Newman and Bloom 2012) all increase preference for otherwise identical objects. In the present research, we expand our understanding of the influence of intentionality on preference beyond its role in creation processes, proposing that unintentionally discovering an object heightens preference for that object. Further, we suggest that this preference is driven by increased counterfactual thought about how the object might not have been discovered.

Because counterfactual thinking is triggered by outcomes deviating from the norm (Kahneman and Miller 1986) and unintentional discovery deviates from the implicit assumption that actions are intentional (Bègue et al. 2010; Rosset 2008; Rosset and Rottman 2014; Spunt, Meyer, and Lieberman 2015), unintentional discovery should inspire counterfactual thought. Past research has indicated that counterfactual thinking can result in a variety of positive consequences. Counterfactual thoughts can heighten the meaningfulness of one's own life experiences through benefit recognition (Kray et al. 2010), increase patriotism and organizational commitment (Ersner-Hershfield et al. 2010), and even paint catastrophic events in a positive light (Teigen and Glad 2011). Especially relevant to the current research, work exploring rumination on counterfactual thoughts has shown that they can change the perception of objectively evaluable outcomes. Bronze medalists in the Olympics were judged as looking happier than silver medalists because the counterfactual of how they might not have won a medal at all was more salient to bronze medalists, thereby positively influencing their perceptions of a quantifiable outcome (Medvec, Madey, and Gilovich 1995). Similar to how bronze medalists are happier about their medals because a reality in which they didn't win a medal at all is salient, we propose that salience of a reality in which an object was not discovered, absent from the world and not able to be experienced by consumers, might increase preference for this object.

Three studies examined consumers' preference for objects discovered either intentionally or unintentionally. Our first study tested our core prediction – that consumers prefer unintentionally discovered objects to otherwise identical intentionally discovered objects. Our second study used mediation analysis to identify our proposed mechanism of increased counterfactual thinking about how discovery of an object might never have occurred as the driver of preference for the object. Our third study expanded this effect to consequential product choice, showing that consumers prefer products when they learn that the basis of the product was discovered unintentionally.

This result enlarges our understanding of the influence of intentionality in preference for objects beyond its role in creation processes. While marketing literature shows that unintentionality in an object's creation process can heighten preference (Newman et al. 2014; Newman and Bloom 2012; Reich et al. 2017), the current research reveals that intentionality plays an important role in the discovery of existing objects. Additionally, the present work illuminates a novel antecedent of consumer preference for objects: counterfactual thoughts about how the objects might not have been found. Finally, while past work has examined how a consumer's sense of having personally discovered a service venue can heighten preference for the venue by strengthening customer-venue bonds (Kokkoris, Hoelzl, and Kamleitner 2019), the present work adds to our understanding by examining discovery as part of an object's biography rather than consumer personal experience.

These results could help to direct museum curators' creation of promotional materials. Moreover, marketing managers could increase preference for their companies' products by highlighting information about unintentional discovery of the basis of their products. Additionally, inspired by works like Marie Kondo's "The Life-Changing Magic of Tidying Up" (Kondo 2014), there exists a current trend towards "decluttering" by getting rid of old possessions which is causing a donation spike to second-hand stores (Brodesser-Akner 2016; Roberts and Schmidt 2019). Our research suggests that second-hand stores and auction houses might benefit from advertising biographical information pertaining to past unintentional discovery of their merchandise to increase consumer preference.

Show Me the Stars: The Persuasive Impact of Dispersion Across Online Ratings

Maximilian Gaerth, University of Mannheim, Germany
Neeru Paharia, Georgetown University, USA
Florian Kraus, University of Mannheim, Germany

EXTENDED ABSTRACT

A growing number of customer review sites (e.g., TripAdvisor, Yelp) display the distributions across reviewers' past ratings. Although recent research in marketing has started to investigate the relationship between reviewer expertise and their rating patterns (Nguyen et al. 2020), whether and to what extent *review readers* use reviewers' rating histories to make inferences about them remains unanswered. Specifically, we propose that observers infer expertise from the dispersion (measured by variance) across reviewers' past ratings. An example of high rating dispersion would be a large number of past positive reviews, in addition to a large number of past negative reviews. Importantly, observers may be neglecting to consider that reviewers are likely weighing the pros and cons for each product/service independently, rather than comparatively. Therefore, when presented with a reviewer's past rating distribution, we expect that observers believe that true experts would more likely discern some products as favorable and others as unfavorable (Alba and Hutchinson 1987). Interestingly, by showing that online review readers incorrectly infer expertise from high rating dispersion, our research identifies an interesting disconnect between online reviewers and WOM readers that deserves further attention.

Study 1A was designed to replicate previous findings by Nguyen et al. (2020) on the relationship between reviewer expertise and rating dispersion by using data collected from Yelp (9,252 reviews). We regressed rating dispersion as a function of expertise (as measured by review volume (Packard and Berger 2017; Reich and Maglio 2020)). Higher reviewer expertise was more likely characterized by low dispersion ($b = -.30$, $SE = .012$, $p < .001$).

In study 1B ($N = 306$), participants were asked to rate reviewers' expertise and review helpfulness after reading a subset of 500 reviews of study 1A (i.e., the 250 reviews written by the reviewers with the lowest and highest rating dispersion). Reviewers whose past ratings were characterized by low (vs. high) rating dispersion were judged to have superior expertise in the domain of restaurants ($F(1, 497) = 10.79$, $p = .001$) and their reviews were perceived to be more useful ($F(1, 497) = 8.45$, $p = .004$).

Study 2 ($N = 302$) examined whether consumers correctly infer expertise from low rating dispersion across reviewers' past ratings. Moreover, we tested for mediational evidence for our proposed mechanism via perceived discernment. After reading a brief shopping scenario, participants viewed a reviewer's profile that depicted either high or low dispersion across past ratings. Then, participants indicated perceived expertise of the reviewer and how discerning he or she appeared. Participants viewed the target reviewer with high (vs. low) rating dispersion as more of an expert ($F(1, 294) = 12.69$, $p < .001$) and more discerning ($F(1, 294) = 11.75$, $p = .001$). Perceived discernment mediated the effect of rating dispersion on perceived expertise ($b = .46$, $SE = .14$, 95% CI = .20, .76). Importantly, different average ratings across past reviews did not interact with the impact of rating dispersion on expertise perceptions ($F(3, 294) = 1.09$, NS).

Study 3 ($N = 212$) tested to what extent consumer choice based on reviewers' dispersion across past ratings might importantly differ from evaluations based on another influential WOM metric (i.e., rating volume). We expected that when only provided with rating volume information, people would be more likely to prefer to purchase the product endorsed by the reviewer with more past ratings. How-

ever, when presenting the underlying distributions, we expected that participants' systematic preferences for the product recommended by the high rating volume reviewer would be dramatically changed. To test our propositions, we employed a 2 (display: rating volume vs. rating volume and distribution) × 5 (pairs: 10 vs. 11, 10 vs. 12, 10 vs. 13, 10 vs. 14, 10 vs. 15) mixed design to test to what extent consumer choice based on rating volume would change in the presence of information about rating dispersion. Participants viewed five pairs of reviewers recommending each a different bar of chocolate and were presented with one of two forms of rating summaries: rating volume or rating volume and distribution. Consistent with previous research findings (Nguyen et al. 2020), the pairs of distributions were constructed such that the reviewer with a lower (higher) rating volume had a higher (lower) rating dispersion. Finally, participants indicated which of both bars of chocolate they would prefer to purchase (binary). The results confirm that participants chose the chocolate recommended by the lower volume reviewer significantly more often when they were assigned to the *rating volume and distribution* condition as compared to the *rating volume* condition ($b = 2.39$, $SE = .18$, $p < .001$). However, in pairs with more extreme review volume differences (e.g., 10 vs. 15 reviewed chocolates), participants were significantly less likely to choose the chocolate recommended by the low review volume reviewer ($b = -.14$, $SE = .05$, $p = .01$). Furthermore, the analysis confirmed a significant indirect effect of rating dispersion on product choice through both the between-subjects perceived expertise factor ($b = .13$, $SE = .01$, 95% CI = .09, .14) as well as the within-subjects perceived expertise factor ($b = .09$, $SE = .01$, 95% CI = .06, .11).

Study 4 ($N = 213$) examined whether consumers are aware of online review readers' tendency to incorrectly infer expertise from high rating dispersion. Surprisingly, participants with the goal to convey expertise with their ratings (vs. control) did not show higher dispersion across their ratings ($F(1, 212) = .89$, NS). Furthermore, domain knowledge did not moderate rating dispersion ($p = .74$).

The present studies extend previous research showing that distributions across past ratings of experts are more likely characterized by low dispersion. First, our paper shows that *high* dispersion across past ratings offers a promising persuasive tactic. This occurs because, compared with low rating dispersion, consumers incorrectly associate high dispersion across reviewers' past ratings with greater discernment and eventually expertise. Second, our studies illustrate that differences in rating dispersion can shape consumer choice. Online retailers could increase the impact of positive reviews on conversions by highlighting reviewers' past rating distributions if they depict high (vs. low) dispersion.

Stakeholder Involvement in Value Co-Destruction: A Case of Promoting Condoms in India

Samanthika Gallage – Nottingham University Business School, University of Nottingham, UK
Sameer Deshpande – Social Marketing@ Griffith, Griffith University, Australia

EXTENDED ABSTRACT

Condom usage is effective both in preventing sexually transmitted diseases (STD), as well as with family planning. Despite multiple attempts to promote condoms in India, the usage remains at a low level of approximately 5% among sexually active men (United Nations, Department of Economic and Social Affairs Population Division, 2019). These attempts possibly might be failing because of the lack of understanding of the complex stakeholder involvement in the value creation and delivery process. Thus, this paper aims to explore the reasons for low condom usage in India by elucidating the stakeholder involvement in the value creation process.

According to Kotler and Lee (2008 p. 7), social marketing is "a process that applies marketing principles and techniques to create, communicate, and deliver *value* to influence target audience behaviors that benefit society as well as the target audience." Thus, social marketers and consumers co-create value through dialogue, interaction, communication, and collaboration for societal benefits (Gordon et al. 2013). *Value* is "idiosyncratic, experiential, contextual and meaning-laden" (Vargo and Lusch 2008, p. 7). Hence, it is imperative to take a context-driven, processual approach in elaborating on the concept of value. In the social marketing context, value co-creation has been ever challenging since social marketers deal with highly complex "wicked problems" (Kennedy 2016, p. 355) where many stakeholders perpetuate problems with multiple, inter-related factors (Kennedy 2016). Therefore, in this value delivery process, stakeholders may either collaboratively create or destruct value (Echeverri and Skålén 2011; Zainudin, Dent and Tam 2017). While it is imperative to study the target consumers in value creation process (Andreasen 2006), it is also equally important to study the involvement of other stakeholders (influential organizations and individuals). Thus, in this study we focus on influential stakeholders selecting the case of condom promotions in India. While India is experiencing a rapid economic growth, specific social issues such as overpopulation, HIV/AIDS, and sexually transmitted infections still concern a society with 1.3 billion people. Government of India and the extensive non-profit social marketing machinery have been actively tackling these issues by promoting condoms, and yet this is an ever more challenging task due to the multiple stakeholders and interconnected factors.

Taking an interpretative approach, we conducted 58 in-depth interviews with managers and other influential stakeholders representing diverse organizations who promote condom use in India. The snowball technique was utilized to recruit participants (Details of these organizations are given in table 1). We conducted "long interviews" (McCracken 1988) that lasted for around 90 minutes to 2 hours. The conversation started with demographic questions followed by seeking participant's opinions about condom-promotion related social marketing efforts to prevent HIV/STD, role, and influence of prominent stakeholders and challenges experienced by these efforts, primarily focusing on value co-creation. Interviews were transcribed verbatim; authors independently read the transcripts, assigned codes, developed themes, and then discussed themes and arrived at a consensus (Ryan and Bernard 2003).

Our findings suggested that during the process there are two types of value co-destructors, namely *culturally led destructors,* and *stakeholder related destructors*. Culturally led destructors are associated mainly with sexual conservatism of the Indian society. Par-

ticipants explained how sex is "looked down upon," "stigmatized," and the "homophobic attitudes" in the society impacting their efforts. The immorality and conservatism around sex get converted into immorality around HIV/AIDS and STDs. These cultural views largely impact the knowledge about sexuality, family planning, HIV/AIDS, and, ultimately, destruct the value of condom use. Participants also suggested the "patriarchal attitudes" resulted in dire consequences for women (wives, sex workers, hijras – third gender) because men are unwilling to collaborate. These culturally led challenges have largely steered into a value co-destruction in the process rather than a value co-creation.

Data also suggested various stakeholders (apart from consumers) such as politicians, government officials, media, healthcare workers, and celebrities disrupt the value creation process. Politicians are worried about voter backlash, therefore hesitant to openly discuss the issues and government officials perceive Indians are superior to westerners and have better sexual morals. These top officials' interpretations of condom use make it challenging for social marketers to create awareness and normalize condom consumption in this society. While stakeholders reflect society's opinion, these views are amplified on media, perpetuate, and further impact consumer attitudes. Further, data also suggest that cooperation from healthcare workers is far from adequate. Some participants indicated that some doctors and nurses refuse to deliver the baby of a woman infected with HIV/AIDS. Finally, celebrities like cricketers and film stars are shy to say condoms; they would instead refer to the word "helmet" as a form of protection, and retailers feel shy and disburse condoms in plastic bags. Thus, these influential stakeholders destruct the value creation process.

Successful co-creation is dependent on the value and cultural congruencies (Echeverri and Skålén 2011). However, the outcomes are jeopardized when complementarities are not present. This is mainly due to the intended value creation by condom usage continuously clashes with cultural elements such as sexual conservatism, lack of education and awareness, and patriarchal attitudes. Moving beyond, the study also suggests that value destruction can happen not just because of in-complementariness between the consumer and the provider as indicated in value co-creation research (Prahalad and Ramaswamy 2004), but also other significant stakeholders. In this case, it is politicians, media, celebrities, health care workers, and government officials magnify the co-destruction.

Theoretically, we extend the understanding of the concept of value destruction in the social marketing context, primarily focusing on stakeholder involvement. Utilizing these insights, practitioners can learn how to overcome value destruction by managing stakeholder relationships in the process. In conclusion, when the dominant culture does not complement the functional and symbolic value of the product or service, which is the case in most social marketing and not-for-profit contexts, a value co-destruction could occur.

How Does Incongruity Perception Influence Product Evaluation? Examination of the Inverted U Shape Relation Predicted by Schema Congruity Theory

Xin Gao, Wageningen University, The Netherlands
Ilona E. de Hooge, Wageningen University, The Netherlands
Arnout R.H. Fischer, Wageningen University, The Netherlands

EXTENDED ABSTRACT

To develop positively evaluated new products, it is crucial to understand the relation between incongruity of products and product evaluation. Consumers easily get bored with typical products, while they often reject products that are extremely incongruent with their expectation (Alexander, Lynch Jr, & Wang, 2008). Schema congruity theory predicts an inverted u shape relation between incongruity and evaluation. Moving from stimuli that are congruent to extremely incongruent, evaluation first increases then decreases (Mandler, 1982).

Although findings from multiple studies seem to support the theory (e.g., Noseworthy, Di Muro, and Murray, 2014; Jhang, Grant, and Campbell, 2012), the evidence appears circumstantial. Most studies created three incongruity levels (congruent, moderately incongruent, extremely incongruent) and examined the theory in between-subjects approach (individuals never saw different stimuli from all three incongruity levels). This approach has two disadvantages. First, where incongruity is defined as the degree of discrepancy between a presented object and the existing schema (Meyers-Levy & Tybout, 1989), dividing incongruity into three levels does not fully reflect the nature of incongruity as a subjective perception from individuals. Second, the theory implies that effect of incongruity on evaluation occurs on individual level, but between-subject approach can only examine the effect on group level. The current research aims to overcome these disadvantages by measuring incongruity as a continuous perception variable and using a within-subject design.

To examine the theory in relevant marketing settings, we used realistic materials differing in two dimensions (conventional vs. repurposed; natural vs. artificial). For example, bamboo (building material) is natural and repurposed for making t-shirts; polyester is an artificial and conventional material for t-shirts. Beyond hypothesizing that repurposed materials are more incongruent than conventional – possibly because of the number of processing steps needed to repurpose a material, we investigated underlying causes of incongruity. Existing research suggests that when evaluating an atypical product, consumers first tried to understand its function (Chitturi, Raghunathan, & Mahajan, 2007). Therefore, we proposed that consumers who fail to understand the material function, consider its use in products to be incongruent.

We thus predicted: (H1) repurposed materials are less congruent than conventional materials (all studies); (H2) an inverted u shape relation exists between incongruity and product evaluation (all studies); and (H3) incongruity is caused by lack of perceived functionality (Study 2 (exploratory), 3a and 3b (confirmatory)). Hypotheses, sample sizes and analysis plans were pre-registered on Open Science Framework before data collection (https://osf.io/w7c94/).

All studies were conducted online using Prolific. Different product categories and corresponding materials were used across studies (Study 1a: bags; 1b and 2: shoes; 3a and 3b: t-shirts). In Study 1a and 1b (N_{1a} = 165, N_{1b} = 161), each participant considered 8 products in a 2 (Natural: natural/artificial) x 2 (Repurpose: repurpose/convention) within-subject design, with two stimuli per condition to increase robustness. Participants first indicated how much they liked 8 products and 8 materials separately. Then 8 out of 64 possible combinations of product pictures with material information (e.g., "This backpack is made of pineapple leaves") were presented. Participants assessed per-ceived incongruity of the material and evaluated the product again. All scales ranged from 1 (not at all) to 100 (very much). Study 2 (N = 103) replicated Study 1b. Additionally, participants were asked to compare sturdiness of the materials for shoes; and how many steps it would take to prepare a material for use. Studies 3a and 3b (N_{1a} = 105, N_{1b} = 101) replicated Study 2 with different products (t-shirts), and instead of sturdiness, we included four t-shirt relevant functions (durable, soft, washable and breathable) for material comparisons.

We tested all hypotheses in Bayesian linear mixed models. If 95% credible intervals of slope coefficients do not include 0, we claim the corresponding effects exist. H1 was confirmed in all studies: repurposed materials were more incongruent than conventional (table 1).

To test inverted u shape relation between perceived incongruity and product evaluation (H2), we conducted interrupted linear regressions (Simonsohn, 2018). A breaking line separated the region from 1 (incongruity) to 100 (congruity) into two parts. The shape is an inverted u if on the left part the slope is positive, and on the right part the slope is negative. If the standard deviation of slopes is close to or includes 0, we claim that individual difference is too small to care (Miller & Schwarz, 2017). All studies showed a flat line (no relation) between perceived incongruity and product evaluation on both group level and individual level (table 2).

To examine whether lack of perceived functionality explained incongruity, we conducted mediation analysis on the effect of repurpose on incongruity. The results showed that in Study 2, the effect of repurpose on incongruity was mediated by lack of sturdiness (in shoes) (β = -6.81, 95%CI [-14.69, -0.91]), and in Study 3a and 3b, the effect was mediated by lack of softness (in t-shirts) (β_{3a} = -3.10, 95%CI [-7.02, -0.13]; β_{3b} = -3.50, 95%CI [-7.26, -0.73]). We considered the mediation effect from lack of perceived product relevant functionalities (sturdiness for shoes, softness for t-shirts) as strong evidence to confirm H3. Exploratory analysis showed processing steps of materials was also a mediator in Study 2 (β = -3.50, 95%CI [-8.07, -0.39]), but the effect did not replicate in Study 3a and 3b.

Two main findings stand out. First, repurposed materials were perceived more incongruent than conventional, and this can be explained by lack of perceived functionality. Marketers might counter this by emphasizing, for example, sturdiness of pineapple leaves bags. Second, no relation between incongruity and evaluation was found. This may imply the inverted u shape is not as strong as often assumed, or that incongruent stimuli for theory examination are class specific. Much previous research used products which are difficult to categorize, for example a low-price luxury car which fits either luxurious or low-price category. However, consumers may easily categorize bamboo t-shirts as t-shirts and nevertheless perceive incongruity because they consider bamboo as non-functional for t-shirt fabric. We recommend exploring potentially different classes of incongruity in the context of schema congruity theory.

Ladies First, Gentlemen Third! The Effect of Narrative Perspective on Medical Crowdfunding

Fei Gao, Bentley University, USA
Xitong Li, HEC Paris, France
Yuan Cheng, Tsinghua University, China
Yu (Jeffrey) Hu, Georgia Institute of Technology, USA

EXTENDED ABSTRACT

Medical crowdfunding becomes increasingly popular (Burtch and Chan 2018). However, many medical fundraising campaigns fail to get fully funded because they are not presented in an effective matter. Surprisingly, the first and perhaps the most important decision for crafting a medical crowdfunding campaign – which perspective (the first- vs. third-person perspective) should be used to narrate the campaign – has not yet been explored. The *first-person* perspective refers to the case where the fundraising campaign is narrated as a patient is raising funds for herself (e.g., "*Leukemia is going to take away my life! Please help me stay with my parents!*"), whereas the *third-person* perspective refers to the case where someone else (often a relative or friend of the patient) is raising funds for the patient (e.g., "*Leukemia is going to take away our daughter's life! Please help her stay with us!*").

In this study, by drawing upon multiple theories, we propose that the relative effectiveness of the first-person, compared to the third-person, perspective is contingent on patient gender of fundraising campaigns. On the one hand, social role literature suggests that men, compared to women, are perceived to be more competent and independent (Barbee et al. 1993), powerful and dominant (Vescio et al. 2005), and aggressive (Eagly and Steffen 1986). Therefore, a direct donation request from the first-person perspective by a *male* patient may cause psychological oppression on donors and thus lead donors to be reluctant to donate. By contrast, the third-person perspective imposes psychological distance between fundraisers and donors (Trope and Liberman 2010), which can alleviate the psychological oppression incurred by a male patient's direct donation request. Therefore, using the third-person perspective to narrate a male patient's fundraising campaign will be more effective than using the first-person perspective in motivating the public's donations.

On the other hand, compared to men, women are perceived to be more cooperative (Stockard et al.1988) and agreeable (Weisberg, DeYoung, and Hirsh 2011), and less powerful and dominant (Vescio et al. 2005). Thus, a direct donation request by *female* patient from the first-person perspective is less likely to induce pressure or uncomfortable feelings for donors. In fact, requesting a donation from the first-person perspective by female patient can draw closer the psychological distance between the fundraiser and the donors (Trope and Liberman 2010) and lead donors to have an internal experiencer perspective (Brunyé et al. 2009), thus strengthening donors' empathy toward the female patient. Thus, using the first-person perspective to narrate a female patient's fundraising campaign will be more effective than the third-person perspective in motivating the public's donations.

We test these propositions by first conducting a large-scale randomized field experiment on a leading medical crowdfunding platform in China, manipulating more than 1,000 fundraising campaigns and involving about 1.2 million potential donors. Our findings show that the effect of the narrative perspective on soliciting donations is indeed contingent on patient gender; that is, the third-person perspective is more effective in motivating donations for male-patient fundraising campaigns, whereas the first-person perspective is more effective for female-patient fundraising campaigns. Furthermore, we conduct a set of moderating analyses, and find that (i) the relative effectiveness of the first-person perspective, compared to the third-person perspective, increases when fundraising campaigns are for (male and female) child patients; (ii) the relative effectiveness of the first-person perspective, compared to the third-person perspective, decreases significantly for male visitors facing male-patient fundraising campaigns, but it increases significantly for male visitors facing female-patient fundraising campaigns; and (iii) for male-patient fundraising campaigns, the relative disadvantage of the first-person perspective is largely driven by the visitors with a small historical donation amount (or a relatively weak empathy trait). These findings consistently support our theorizing on the underlying mechanisms.

We then conduct an online behavioral experiment which aims to provide more *direct* evidence for the underlying mechanisms. The results show that (i) for the male-patient campaign, the relative advantage of the third-person perspective, compared to the first-person perspective, is driven by the lower level of psychological oppression, but it is not mediated by empathy; and (ii) for the female-patient campaign, the relative advantage of the first-person perspective, compared to the third-person perspective, is driven by the higher level of empathy, but it is not mediated by psychological oppression. The results enhance not only the internal validity of our main findings from the field experiment, but also the externality validity by showing that the findings can be generalizable to the western culture.

Our research makes two important contributions to the literature. On the one hand, we contribute to the literature on charitable donations and medical crowdfunding by exploring how narrative perspective could influence potential donors' donation behaviors. We show that an adjustment of the narrative perspective (the first- vs. third-person perspective) based on patient gender can significantly affect the effectiveness of a fundraising campaign. To the best of our knowledge, none of prior studies has examined the effect of narrative perspective on soliciting donations in the context of medical crowdfunding. On the other hand, we contribute to the literature on prosocial behavior and gender by providing both field and laboratory experimental evidence that a direct donation request from the first-person perspective for a male recipient may cause greater psychological oppression on donors than an indirect donation request from the third-person perspective, thereby resulting in less donations, and a direct donation request from the first-person perspective by a female recipient may induce a greater empathy than an indirect donation request from the third-person perspective, thus leading to more donations.

The Joint Effects of Status and Power Distance Belief on Consumer Preference for Cuteness

Huachao Gao, University of Victoria, Canada
Dengfeng Yan, NYU Shanghai, China

EXTENDED ABSTRACT

Cute products are pervasive and represent a huge market (Mc-Grath 2015). Previous research has largely focused on the consequences of consuming cute products, including indulgent consumption (Nenkov and Scott 2014), careful behavior (Glocker et al. 2009), and retention decisions (Jia, Pol, and Park 2016). This research examines the antecedents of cute product preferences based on social status and the cultural value of power distance belief (PDB), which refers to an individual's expectance and acceptance of social inequality (Oyserman 2006).

Following Lorenz's (1943) definition of *Kindchenschema*, including features such as a high forehead, large eyes, large cheeks, and a small nose, we define cute products as those that have babyish features, representing human babies or baby animals (Hellén and Sääksjärvi 2013). Previous research has found that cute products may signal innocence, weakness, and needs to be taken care of (Hellén and Sääksjärvi 2013). Nenkov and Scott (2014) noted that *Kindchenschema* cute products are associated with naiveté and vulnerability, which in turn triggers caretaking motivations. Along the same line, Jia, Pol, and Park (2016) found that cute-looking products elicit caretaking behaviors, increasing consumers' product retention.

According to signaling theory, products can symbolize owners' personal traits/beliefs (Belk 1988). Following this logic, we propose that consuming cute (vs. non-cute) products will signal to others that the consumers are more vulnerable, naïve, and weak. We then propose that consumers who have stronger need for protection, or require others' attention and help in achieving important goals, tend to prefer cute products. Then, under what conditions consumers may have stronger need for protection.

According to the PDB literature, for high-PDBs, status differences should be accepted and respected (Han, Lalwani, and Duhachek 2017; Wang, Torelli, and Lalwani 2020; Winterich, Gangwar, and Grewal 2018; Winterich and Zhang 2014). Thus, those with low status tend to demonstrate their absolute obedience (Atwater et al. 2009) and behave submissively (Gao, Winterich, and Zhang 2016). Under this culture, low-status individuals find it impossible to get anything done without their superiors' helps. As Lian, Ferris, and Brown (2012) pointed out, the ability to catch superiors' attention and elicit their willingness to offer helps is critical for high-PDB-low-status individuals. In contrast, high-PDB-high-status individuals are motivated to demonstrate their absolute power and control over others (Zhang, Winterich, and Mittal 2010). Any sign of help- or protection-seeking will be regarded as weak and incompetence (Lian, Ferris, and Brown 2012). Thus, we propose that high-PDB-low-status consumers have stronger need for protection than high-PDB-high-status consumers.

As low PDB consumers believe inequality and social hierarchy are illegitimate, their behaviors are not significantly impacted by their relative social status (Atwater et al. 2009). As such, we argue that their need for protection is not as high as high-PDB-low-status consumers, and not as low as high-PDB-high-status consumers. In other words, for low PDB consumers, regardless of their relative status, their need for protection is medium or between high-PDB-low-status and high-PDB-high-status consumers'. Combining the above analysis, we propose an interactive effect of PDB and social status

on cute (vs. noncute) products. Furthermore, we propose need for protection as the mediator.

Four studies were conducted to test the above theorizing. Study 1 was a field study, in which we measured consumers' PDB (Yoo, Donthuy, and Lenartowicz 2011) and manipulated their relative social status. Then, we observed their actual purchases between cute versus non-cute car accessories. The results showed that among chronically high-PDB consumers, those of low (vs. high) status were more likely to purchase cute car accessories. In contrast, among chronically low-PDB consumers, there was no such a difference.

Study 2 was a 2 (PDB: high vs. low) × 2 (status: high vs. low) between-subjects design. We first manipulated PDB (Zhang, Winterich, and Mittal 2010) and social status (Anderson et al. 2012). Then, we showed participants one cute versus one non-cute speaker, and asked for their purchase intention. Next, we measured need for protection (Goff et al. 2014). The results not only supported the interactive effect of PDB and social status on purchase intention for cute products, but also supported need for protection as the mediator.

Study 3 tests high psychological security as a boundary condition for the proposed effect. Specifically, if consumers have high psychological security, they will have very low need for protection, regardless of their PDB and social status. It was a 2 (PDB: high vs. low) × 2 (social status: high vs. low) × 2 (psychological security: high vs. low) between-subjects design. We first manipulated PDB and social status. Next, we manipulated psychological-security by offering participants either a one-year versus life-long contract. Then, participants indicated their preferences between one cute versus one non-cute keychain. The results showed that the interactive effect of PDB and social status was replicated in the low psychological security condition, but attenuated in the high psychological security condition.

Study 4 tests locus-of-control as another moderator. Specifically, consumers with internal (vs. external) locus-of-control should have lower need for protection given they believe in themselves. It was a 2 (PDB: high vs. low) × 2 (status: high vs. low) × 2 (locus-of-control: measured) mixed design. We first manipulated PDB and status Next, participants encountered one cute and non-cute air purifiers, and indicated their preferences. Then, we measured locus-of-control (Burroughs and Mick 2004). The results showed that the interactive effect of PDB and status was replicated among externals, but attenuated among internals.

This research first contributes to the cute-product design literature by identifying PDB and social status as important antecedents of consumers' preference for cute over non-cute products. Second, it indicates that social status has a broader impact on consumer decision making, even for products that are seemingly unrelated to status. Third, we extend the PDB literature by introducing the concept into a new research filed and identifying need for protection as a new mechanism through which PDB exerts its effect. Lastly, by testing the moderating roles of psychological security and locus-of-control, we further extend our understanding of the joint effect of PDB and social status on preference for cute versus non-cute products.

How Experiences of Freedom Foster Consumer Happiness? A Distinction Between "Freedom to" and "Freedom from" Experiences of Consumption

Charlotte Gaston-Breton, ESCP Business School, Spain
Elin Brandi Sørensen, University of Southern Denmark, Denmark
Thyra Uth Thomsen, Copenhagen Business School, Denmark

EXTENDED ABSTRACT

In many societies today, a personal feeling of freedom is a valued experience, but how many people miss out on it because they are caught up in the activities of modern life? This could include the feeling of being entrapped in the duties and activities of work and family, even if someone really loves his or her job and is truly devoted to family. Despite this, how many people do not try to find ways, through consumption, to help them feel free from the pace of life, at least for a short time, or to reconnect with themselves? People's efforts to provide themselves with experiences of freedom through consumption can also be regarded as attempts to make themselves happier.

Consumer behavior literature traditionally investigates freedom in consumption through the concept of "freedom of choice" (see Markus & Schwartz, 2010). Still, little is known about experiences of freedom versus conditions of freedom, and thus there is a need to shed light on the positive and negative aspects of freedom in consumption. As the philosopher Erich Fromm (1941) discussed, "Freedom From" (FF), or negative freedom, is the absence of something (i.e. of obstacles, barriers, constraints or interference from others) whereas "Freedom To" (FT), or positive freedom, is the presence of something (i.e., of control, self-mastery, self-determination or self-realization). This mechanism echoes the prevention/ promotion theory of regulatory focus (Higgins, 1998) and, in consumer research, those concepts have been indirectly studied considering consumption either as an escape from the structures of everyday life (Cova, Carù, & Cayla, 2018) or as the form of free access to fluid identity construction (Belk, 1988). Against this backdrop, we wonder how these FF and FT notions of freedom in consumption are represented and are linked to consumer happiness.

Fueled by the classic work of Van Boven and Gilovich (2003), a large stream of research has investigated the impact of experiences of consumption on happiness. In general, studies show that the type of good (e.g., experiential vs. material; Gilovich, Kumar, & Jampol, 2015) but also the nature of the experience (e.g., ordinary vs. extraordinary; Bhattacharjee & Mogilner, 2014) influence consumer happiness. These findings are often criticized, however. The measure of consumer happiness is indeed commonly limited to the hedonic, pleasure-based form of happiness (e.g., Etkin & Mogilner, 2016; Guevarra & Howell, 2015) but it is now widely acknowledged that the eudaimonic, meaning-based form of happiness is also an important and distinct aspect of well-being, in general (Huta & Waterman, 2014; Ryan & Deci, 2001) and of consumer happiness, in particular (Schmitt, Brakus & Zarantonello, 2015; Sääksjärvi, Hellén, & Desmet, 2016). To cover this gap, we investigate how experiences of FF and FT achieved through consumption (both immaterial and material) affect the hedonic and eudaimonic dimensions of happiness.

Our research addresses three questions: How are experiences of freedom in the consumption realm linked to consumer happiness? What are the characteristics of such experiences of freedom? and How do experiences of FF influence consumer happiness, especially in comparison with FT? We conducted a qualitative study, a semantic analysis and an experiment to answer respectively each question.

Study 1. To explore consumers' own meanings of experiences of freedom and their relationships with happiness, we conducted a multi-sensory sculpting (MSS) study, which is a projective technique that taps into embodied consumer knowledge (Von Wallpach & Kreuzer, 2013). We organized two MSS workshops with a mixed-gender postgraduate student population (N = 32). Each participant was asked to build a sculpture from a toolkit containing building materials of different shapes, colors, textures, smells, and sounds. The sculpting process was initiated with the following prompt: "Using the materials you find on the table, build a sculpture that represents your experience with the consumption of a product or service that brings you happiness." Next, we interviewed participants from a semi-structured guide. The participants built sculptures representing happiness that related to the consumption of both objects (e.g., a sweater, a store, ice cream) and activities (e.g., yoga, a bus ride, surfing, manicure). We recorded the interviews and analyzed the transcripts, approximately 60 pages, by means of a "hermeneutic circle," including going back and forth between interpreting the parts based on an understanding of the whole (Thompson, Pollio, & Locander, 1994) both intra-textually (i.e., within one sculpting interview) and inter-textually (i.e., comparing themes emerging from one sculpting interview with themes from other sculpting interviews).

Analysis of the MSS interviews shows that both dimensions of hedonic and eudaimonic consumer happiness were related to the concept of freedom, which surfaced repeatedly in our analysis. In the 32 interviews, the words freedom or being free were mentioned directly 21 times. However, the concept of freedom was represented much more often indirectly, for example when the accounts echoed the conceptual difference between FF (e.g. escaping from worry) and FT (e.g. becoming whatever you want to be). For example, FF surfaced in Jenny's description of the sculptured Disney brand as follows: *"For me I think it is kind of an escape. For me even though I am 20 years old I can still go and watch a Disney movie. It makes me not have to worry about what's going on in the real world. Everything is just perfect in those two hours. It is just nice to have a little escape like a little paradise. [...] you can just kind of let go of all your worries…".* In terms of FT, Jim described his sculpture of an island as a "sweet and warm" children's wonderland, with the island representing a place and time in life in which everything is possible: *"Maybe because of the freedom when you can think whatever you want to be and you feel the freedom like in your life that you can achieve anything you want to. So this kind of freedom brings me the achievements that can be done in my life and it feels good."* The wonderland clearly illustrates the breadth of self-development options available (FT).

Study 2. To shed further light on the differences between experiences of FF and FT in the consumption realm, we replicated the methodological approach Bhattacharjee and Mogilner (2014) used to distinguish the different ways consumption can be experienced. We recruited a sample of 95 Amazon Mechanical Turk participants (aged 19–65 years; *M* = 38; 53% female) and we randomly assigned them to situations in which they recalled a consumption experience that was either an FF or an FT. Given the findings of the MSS study, the instructions intended to place some participants in the FF condition read: "Please bring to mind an experience with the consumption of a product, a brand, or a service encounter that makes you feel free from worries and allows you to escape from routine." The instructions that

placed the other participants in the FT condition read: "Please bring to mind an experience with the consumption of a product, a brand, or a service encounter that makes you feel free to be yourself and allows you to reconnect with your true self." Subsequently, we asked participants in both conditions to choose three keywords representing the "essence of that experience."

After discarding irrelevant accounts as well as those directly related to the instructions given, we finally analyzed 84 quotes and 205 keywords. Although each participant's recalled experience of consumption was unique, three independent coders agreed on the distribution of those 205 keywords into 10 broad categories. Among them, the most reported categories are peacefulness (27.8%), invigoration (14.6%), happiness (11.7%), satisfaction (8.8%), playing (8.3%), social connection (5.4%) or health (2.9%). Scrutinizing the categories of keywords in more detail, we find that their relative frequencies differ by condition ($\chi^2(9) = 17.6$, $p < .05$), which supports the notion that consumers in the FF condition experience consumption differently from how consumers in the FT condition experience consumption. More specifically, a z-test shows that differences are significant for the keyword categories of "invigoration," "social connection," and "health" (respectively, $z = 3.33$; $z = 2.27$; $z = 2.27$; $p < .10$). We find that the condition of FT is associated to "invigoration" as this refers to an inner state that may arise from seeking self-actualization through consumption choices. For example, one participant explained how the consumption of coffee boosts the potential for achievement.

Study 3. We tested the following hypotheses: "FF experiences of consumption lead to greater hedonic happiness than FT experiences" (H1) and "FT experiences of consumption lead to greater eudaimonic happiness than FF experiences" (H2). We recruited a sample of 90 individuals (aged 20–63 years; $M = 37$; 56% female) from Amazon Mechanical Turk to participate in the study. Respondents were assigned to either FF or FT conditions as instructed in study 2. After describing their experience, participants indicated how much it contributed to their happiness in life (Van Boven & Gilovich, 2003) on one item: "How much do you think that this type of experience contributes to your happiness in life?". They also reported the contribution of their recalled experience to hedonic and eudaimonic happiness on, respectively, the scale of affect (four-item index; e.g., "This type of experience makes me feel in a good mood"; $\alpha = .866$) and the scale of meaning (four-item index; e.g., "This type of experience makes me feel life has a purpose"; $\alpha = .926$) used by Hepper et al. (2012).

The manipulation checks confirm that respondents were correctly assigned to FF condition ($F(1, 88) = 5.17$, $p = .02$) and FT condition ($F(1, 88) = 4.18$, $p = .06$). Both dimensions of happiness are related to general happiness ($F(1, 89) = 27.25$, $p = .000$), but the manipulation of the nature of the experience recalled (FF vs. FT) has a different influence on the hedonic and eudaimonic dimensions of happiness. Participants in the FF condition were more likely to report greater hedonic happiness than those in the FT condition ($M_{FF} = 6.46 > M_{FT} = 6.02$; $F(1, 88) = 4.22$, $p < .05$), in support of H1. Alternatively, participants in the FT condition were more likely to report greater eudaimonic happiness than those in the FF condition ($M_{FT} = 4.65 > M_{FF} = 4.10$; $F(1, 88) = 2.72$, $p < .10$), in support of H2.

This research shows the existence, meaning, and role of FF and FT in regulating consumer happiness in two ways: experiences of FF foster more hedonic than eudaimonic happiness, while experiences of FT foster more eudaimonic happiness than hedonic happiness. Table 1 proposes a summary of the findings of each study. Our research contributes theoretically to the transformative consumer research agenda (Crockett et al., 2013) and adds to the stream of

research related to the regulatory functions of the marketplace on individual well-being (Machin et al., 2019). Managerially, we identify a typology of experiences that can strengthen either an affective or meaningful relationship with customers and consequently increase customer loyalty (Askoy et al. 2015). We also informs consumers, who often fail to choose situations that maximize their happiness because they cannot identify those that make them happy (Hsee & Hastie, 2006), about routes to happiness.

Any Item, Only $10! When and Why Same-Price Promotions Can Reduce Regret and the Pain of Paying

Shirin Gatter, University of Hohenheim, Germany
Verena Hüttl-Maack, University of Hohenheim, Germany

EXTENDED ABSTRACT

Lately, practitioners have increasingly used a type of promotion that has not been researched until now, a price promotion characterized by an assortment of products that are all reduced to the same price ("same-price promotions," SPP). Examples include clearance sales where clothing items are reduced to a uniform price. Previous research on choice overload found that product assortments can overwhelm consumers (Iyengar and Lepper 2000). This can elicit regret (Chernev, Böckenholt, and Goodman 2015; Schwartz 2000), characterized by the perception that money was misspent and that alternative choices would have been better (Zeelenberg et al. 2002). Reducing regret is important for marketers because it influences repurchasing and complaint intentions (e.g., Tsiros and Mittal 2000). We hypothesized that choice overload and regret were less likely to be elicited by SPPs. If prices are uniform, people think less about them, which is likely to reduce the subjective monetary sacrifice (Bornemann and Homburg 2011), also termed the pain of paying (PoP; Prelec and Loewenstein 1998). Courty and Nasiry (2018) explained this by a reduced risk to pay too much. Bertini and Wathieu (2010) assumed that people instead focus on their preferences. In addition, when people face promotions with differentiated prices (DPP), they might experience anticipated loss when considering buying expensive products and gains when considering cheaper products. Losses outweigh gains (Kahneman and Tversky 1979), and consequently, DPP might enhance the attention to monetary losses. SPP should consequently reduce PoP and therefore also regret. A boundary condition might apply when products are labelled as remaining stock. This might trigger people to fixate on prices and elicit the wish to obtain bargains, which is less achievable if no cheaper options are available. We further expected that if no original prices were provided, the attractiveness of a SPP could not be assessed while a uniform percentage reduction gives an informational advantage and would therefore enhance the attractiveness and reduce regret compared to the SPP.

The voluntary participants in our four online studies were told to imagine that they had thought about purchasing the respective product and had come upon the offers. The prices in the DPPs on average corresponded to the prices in the SPPs. Participants indicated whether they wanted to make a choice, and if so, clicked on the product(s). Only if participants made a choice, their data were further analyzed (between 81% and 96% among the studies) because anticipated regret could not be meaningfully interpreted without a choice. The percentages of participants choosing a product did not vary significantly between the conditions.

Study 1 used a one-factorial design with two conditions (DPP vs. SPP) ($N = 83$). The choice set consisted of six lawn mowers. The anticipated regret was measured with a single item ("I think I would not regret my choice," recoded so that high values represented high regret; Inbar, Botti, and Hanko 2011). In the case of the SPP, the participants were less likely to assume that they would regret their choice ($M_{DPP} = 3.03$, $M_{SPP} = 2.42$, $F(1, 81) = 4.23$, $p = .043$).

Study 2 applied two conditions (DPP vs. SPP) ($N = 154$). Participants were guided to an online shop mock-up offering ten mixers. The statement to assess PoP read: "In this decision, how would you have felt with regard to spending money?" The answering scale consisted of smiley-face images (1-*looked very sad*/7-*looked very happy*, recoded so that high values represented high pain; Thomas, Desai, and Seenivasan 2011). In the case of the SPP, the participants were less likely to assume that they would regret their choice ($M_{DPP} = 2.83$, $M_{SPP} = 2.09$, $F(1, 152) = 13.67$, $p < .001$) and perceived lower PoP ($M_{DPP} = 3.17$, $M_{SPP} = 2.30$, $F(1, 152) = 17.84$, $p < .001$). The regret-reducing effect of SPP was fully mediated by a reduced PoP (PROCESS, Hayes, 2018, IE = –.41, CI: [–.64, –.21]).

Study 3 used a 2 (promotion: DPP vs. SPP) × 2 (labelling: none vs. "remaining stock") factorial design ($N = 131$). People were guided to an online shop mock-up with an assortment of six coffee machines. A large red sign stating "remaining item" was used as labelling. The interaction between the type of price promotion and labelling was significant ($F(1, 127) = 5.29$, $p = .023$), while labelling ($p = .062$) and type of promotion ($p = .667$) were not significant. With remaining stock labelling, the participants assumed higher levels of expected regret of their choice in the SPP condition ($M_{DPP} = 2.43$, $M_{SPP} = 3.00$); without such labelling, they assumed that they would regret their choice less in the case of the SPP ($M_{DPP} = 2.52$, $M_{SPP} = 2.13$).

Study 4 used a 2 (promotion: 20%-discount vs. SPP) × 2 (provision of original prices: no vs. yes) experimental design ($N = 131$). The choice sets consisted of 12 pullovers for women. The assortment attractiveness was assessed with three items (e.g., "The choice set is…," 1-*not at all appealing*/7-*very appealing*, α = .923). Only the interactions between the type of price promotion and the presence of original prices on regret ($F(1, 126) = 6.09$, $p = .015$) and assortment attractiveness, ($F(1, 123) = 7.89$, $p = .006$) were significant (all others, $p > .361$). In the case where original prices were absent, promotions with a uniform percentage discount caused lower regret than the SPP ($M_{20\%} = 3.09$, $M_{SP} = 3.77$) and a higher perceived assortment attractiveness ($M_{20\%} = 4.60$, $M_{SPP} = 3.88$), while the opposite pattern was shown when the original prices were depicted (regret: $M_{20\%} = 3.50$, $M_{SPP} = 2.91$; assortment attractiveness $M_{20\%} = 3.69$, $M_{SPP} = 4.34$). The effect on reduced regret was mediated by assortment attractiveness (IE = –.58, CI: [–1.19, –.15]).

Our research builds on the literature regarding choice overload, uniform pricing, and choice regret. We demonstrated that SPPs can reduce choice regret and that this was mediated by PoP and perceived assortment attractiveness. However, regret was not reduced if a cue contested the attractiveness of the assortment or when no original prices were depicted.

Corporate Social Responsibility Information Dilutes Brand Positioning

Tarje Gaustad, Kristiania University College, Norway
Jakob Utgård, Kristiania University College, Norway

EXTENDED ABSTRACT

The current research investigates the consequences of communicating CSR-activities on consumers' price expectations for a given brand. The results of three studies show that CSR information increases price expectations for low price image brands and decreases price expectations for high price image brands.

The current paper investigates unintended consequences of communicating CSR- activities on consumers price expectations for a given brand. We study how the relationship between CSR and consumers' price expectations is influenced by a brand's existing price image - whether the brand is perceived as low-cost or a premium priced luxury brand. We propose that for low price image brands, CSR information increase quality perceptions and thereby also price expectations (Chernev & Blair 2015). For price image brands, however, CSR information signal social consciousness and thereby decrease price expectations (Torelli, Monga, & Kaikati 2012). Consequently, corporate social responsibility information may dilute brand positioning for both low-cost and luxury positioned brands.

THEORY AND HYPOTHESES DEVELOPMENT

Price image is the general belief about the overall level of prices that consumers associate with a retailer or brand. Price image is not related to the evaluation of a single price or a set of prices but the overall impression of the aggregate price level (Hamilton & Chernev 2013). In the current research, we apply the term price image to describe the general impression of whether a brand is expensive or inexpensive. Particularly, we investigate how consumers respond to communication of CSR initiatives from low-cost positioned brands (low price image) and highly priced, luxury brands (high price image), respectively.

Research has shown that information about CSR initiatives can enhance company reputation and create goodwill among customers (Sen, Du, & Bhattacharya 2016).

Interestingly, CSR information has also been shown to influence consumers' product quality judgements directly (Chernev & Blair 2015). This occurs because consumers tend to interpret engagement in CSR activities as a signal of the brand's moral values (Chernev & Blair 2015).

For low price image brands, we believe that the effect of CSR as a quality signal is particularly strong. Low price image brands typically are perceived to be pushing margins and for going to great lengths to reduce cost, and then also sometimes compromise quality. By engaging in CSR activities, low price image brands signal that they have a social consciousness and that they do not only care about reducing cost. This is a signal that they can be trusted in terms of delivering sufficient quality. Hence, for a low price image brand, we expect information about CSR initiatives to increase price expectations.

High price image brands, however, are generally expected to be of high quality. Engaging in CSR activities does not increase quality perceptions even further. Torelli, Monga, and Kaikati (2012) have demonstrated that communicating the CSR actions of a luxury brand causes a decline in brand attitude ratings. This happens because a luxury brand's self-enhancement concept (i.e., dominance over people and resources) conflicts with the CSR information's self-transcendence concept (i.e., protecting the welfare of all), which causes disfluency and thereby a decline in brand attitude. Extending from

this, we suggest that CSR information from a high price image brand signals social consciousness, that the brand is not only about self-enhancement, but also cares about others. We posit that this, in turn, decrease price expectations as a pro-social brand is not expected to push margins too extremely. We apply the term *brand halo* to describe the goodwill endowed to a brand due to the perception of its social consciousness.

Summary of hypotheses:

Hypothesis 1:   *Information about CSR initiatives (vs. no CSR information) from a low price image brand increases price expectations*

Hypothesis 2:   *For low price image brands, the effect of information about CSR initiatives (vs. no CSR information) on price expectations is mediated through perceived quality*

Hypothesis 3:   *Information about CSR initiatives (vs. no CSR information) from a high price image brand decreases price expectations*

Hypothesis 4:   *For high price image brands, the effect of information about CSR initiatives (vs. no CSR information) on price expectations is mediated through brand halo*

Study 1

We conducted a 2 (CSR: no information vs. information) ☐ 2 (Price Image: low vs. high) experiment. The data was collected on Qualtrics' online panel with American participants (n = 734), as a filler task in another, unrelated study.

Procedure

Participants read a short text about Pure Jeans (fictitious), a European brand soon to be launched on the US market. The text was designed to manipulate price image. Excerpt from the manipulation: "(Pure Jeans) today holds an inimitable position in the sphere of low-cost but trendy jeans *(vs. trend inspired fashion)*. Pure Jeans offers more affordable jeans to the price-conscious consumer *(vs. upscale jeans to the sophisticated high-end consumer)*."

CSR information was manipulated by including (vs. not including) information about Pure Jeans bearing the responsibility to provide an economically sound, safe, fair and ethical working environment for all the people who are involved in the manufacture of their jeans.

After reading the information about Pure Jeans, participants answered the dependent variable, price expectation. Price expectation was measured with both a direct price estimate

("If you were to guess, how much would you say a pair of Pure Jeans will cost on the US market?") and a scale of expected relative price level (three items like "I expect Pure Jeans' prices to be," on a 1-7 scale, where 1 = Low and 7 = High).

Results

The result showed an interaction between CSR information and price image on price expectation (direct price estimate) ($F(1, 730)$ = 21.67, $p < .01$). In the low price image condition, there was a sig-

nificant positive effect of CSR information ($p < .05$). That is, when initial price image was low, those who received CSR information expected the prices of Pure Jeans to be higher (MCSR = $ 50.07) than those who did not get any CSR information (MNOCSR = $ 41.48). In the high price image condition, there was a negative effect of CSR information ($p < .01$). When price image was high, those who received CSR information expected prices of Pure Jeans to be lower (MCSR = $ 71.42) than those who did not get any CSR information (MNOCSR = $ 91.41). The pattern of results was the same, and also significant, when the index of expected relative price was used as the dependent measure ($F(1, 732) = 29.65$, $p < .01$).

Discussion

The result of Study 1 support the prediction that CSR information from a low price image brand increases price expectations, while the same information from a high price image brand decreases price expectations.

Study 2

Study 2 was designed to replicate the results in another context (wine store) and to test the hypothesis that perceived product quality mediate the effects. The data was collected on Prolific's online panel with American respondents (n = 403).

Procedure

The general experimental set-up was similar to that of Study 1. First, we collected a measure of subjective wine knowledge. Next, participants read about a fictitious wine store (Cellar Maison). The text manipulated price image (low vs. high) and CSR information (filler information vs. CSR information) and described the house wine of Cellar Maison. The participants were randomly assigned to the experimental conditions. Excerpt from the price image manipulation: Cellar Maison is a new chain that specializes in affordable *(fine)* wines to the price-conscious *(sophisticated high-end)* consumer. Excerpt from the CSR information manipulation: Cellar Maison use the most innovative techniques available to manufacture their wines and create value for their customers and stakeholders *(improve energy efficiency, water conservation and packaging, and take all measures available to avoid waste and pollution).*

Next, participants evaluated price expectation and perceived product quality for the store's most popular private label wine. Price expectations was measured similarly as in Study 1, while perceived quality was measured with three items adapted from Sweeney and Soutar (2001) and Habel et al. (2016) ("The Cellar Maison has/is..."1-7 scale, where 1 = Very poor quality/Inferior/Poorly made and 7 = Very high quality/Superior/Well made). Last, we administered a test of objective wine knowledge (Robson, Plangger, Campbell, & Pitt 2014).

Results

We used bootstrapping to test our predictions in a mediated-moderation model (model 8, Hayes 2013). The pattern of results was the same both with and without subjective and objective wine knowledge as covariates.

The results showed an interaction between CSR information and price image on perceived quality ($b = - .65$, $t(399) = - 3.32$, $p < .01$). As expected, perceived quality had a positive effect on price expectations - both for the direct price estimate ($b = 11.04$, $t(394) = 5.39$, $p < .01$) and the index of relative price expectation ($b = .55$, $t(399) = 11.04$, $p < .01$).

Analysis of the full mediated-moderation model showed that the effect of CSR on price expectations was mediated through perceived quality when price image was low (direct price estimate: $b = 5.07$, CI 95%: 2.01 to 9.27; index of relative price expectation:

$b =.25$, CI 95%:.10 to .44). When price image was high, the conditional indirect effect was not significant (direct price estimate: $b = - 2.28$, CI 95%: - 5.60 to .68; index of relative price expectation: $b= - .10$, CI 95%: - .25 to .05).

Discussion

Study 2 support the prediction that quality perceptions mediates the effect of CSR information on price expectations in the low, but not the high, price image condition.

Study 3

We conducted a 2 (CSR: no information vs. information) x 2 (Price Image: low vs. high) experiment, including measures of perceived quality and brand halo, as well as other potentially alternative processes (CSR price markup and luxury associations). In this study, we used a restaurant as the context. The data was collected on MTurk with American participants (n = 400).

Procedure

The general procedure was similar to the previous studies. First, participants read about a fictitious restaurant (Giuliana Ristorante). The text manipulated price image (low vs. high) and CSR information (filler information vs. CSR information). The participants were randomly assigned to the experimental conditions. Excerpt from the price image manipulation: Our low-key *(fashionable)* Italian ristorante, features a mouthwatering variety of inexpensive *(specialty)* pies made with the freshest local ingredients (…). Giuliana Ristorante isn't your average ristorante; it's delicious value for money dining *(fine dining)*.

Excerpt from the CSR information manipulation: Giuliana Ristorante is committed to operate in a professional manner *(responsible and sustainable manner)*. They use the most innovative techniques available to create value for their customers and stakeholders *(improve energy efficiency, water conservation, and take all measures available to avoid waste and pollution)*.

Next, participants evaluated price expectation and the process measures (counterbalanced). Price expectations and perceived quality was measured with the same scales as in the previous studies. Brand halo was measured with seven items adapted from Foreh and Grier (2003) ("Giuliana Ristorante is…" Bad-Good/Unhelpful-Helpful/Unlikable-   Likeable/Insincere-Sincere/Untrustworthy-Trustworty/No at all involved in community-Very involved in community/Doesn't care about customers-Cares very much about customers).

Luxury associations was measured with scales assessing how descriptive different luxury associations (premium, upscale, luxury, prestige, sophisticated, exclusive, and glamorous) was of Giuliana Ristorante. CSR price markup was measured with three items based on Habel et al. (2016) (e.g., "I think Giuliana Ristorante has included its corporate social responsibility activities into its prices). All the measures were on 1-7 scales.

Results

We used bootstrapping to test our predictions in a mediated-moderation model (model 8, Hayes 2013). We included CSR information and price image as independent variables, and perceived quality and brand halo as mediations variables, and price expectation as the dependent variable. CSR price markup and luxury associations was included as covariates.

The results showed that the interaction between CSR information and price image was significant on brand halo ($b = .41$, $t(394) = 2.10$, $p < .4$) but not on perceived quality ($b = -.21$, $t(394) = - 1.25$, $p = .21$). As expected, the effect on price expectations was positive for

perceived quality (b = .32 , t(392) = 5.25, p < .01) and negative for brand halo (b = - .44, t(392) = - 8.45, p < .01).

Analysis of the full mediated-moderation model showed that the effect of CSR on price expectations was positively mediated through perceived quality when price image was low (b= .09, CI 95%: .02 to .19), but not when price image was high (CI 95%: - .05 to .12). Furthermore, the effect of CSR on price expectations was negatively mediated through brand halo when price image was high (b = - .28, CI 95%: - .43 to - .14), but not when price image was low (CI 95%: - .23 to .02).

Analyses of the alternative process measures showed no effects of luxury associations, neither when we tested the interaction between CSR information and price image on luxury associations (p = .79) nor when luxury associations was included as a mediator in the full mediated-moderation model (CI 95%: - .23 to .18). There was, however, an interaction between CSR information and price image on CSR price markup (b = .70, t(400) = 2.58, p <.02). The effect was such that CSR information increased perceived price markup in both price image conditions (Low price image: b = .13, t(395) = 6.90, p < .01; High price image: b= .20, t(395) = 10.50, p < .01). This pattern was also present when CSR price markup was included as a mediator in the full mediated-moderation model (CI 95%: .23 to .23). Hence, even though CSR price markup influences price expectations, it does not explain the diverging results between price image conditions.

Discussion

Study 3 support the prediction that perceived quality positively mediates the effect of CSR information in the low price image condition, while brand halo negatively mediates this effect in the high price image condition. These effects are prevalent even when controlling for luxury associations and CSR price markup.

General Discussion

In three studies we have found that CSR information influences price expectations. The results show that CSR information increases price expectations for low price image brands and decreases price expectations for high price image brands. These effects are mediated through perceived quality and brand halo, for low and high price image brands respectively.

These results demonstrate intriguing adverse consequences of communicating CSR initiatives. CSR information can dilute brand positioning. Albeit the positive influence of CSR information on quality perceptions for low price image brands, an increase in price expectations moves the brand away from a low-end positioning. For high-end positioned brands, our results allude that CSR information might decrease quality perceptions and move the brand away from a high-end positioning. For both low and high price image brands, CSR information moves price perceptions towards the middle, which might not be a good place to be stuck.

Offering Initial Evidence of a Choice-Removal Effect

Brian Gillespie, University of New Mexico, USA
William Ryall Carroll, St. John's University, USA
Christian Otto, Backcountry.com

EXTENDED ABSTRACT

Consumers are often presented with consideration sets in which they are required to simultaneously compare multiple options before making a choice (Hsee et al., 1999). In response, consumers make comparative judgments of individual option attributes against an average of all option attributes in a series of weighted evaluations (Bhargava, Kim, & Srivastava, 2000). Furthermore, extant research has indicated that as choice sets vary, these averaged attribute evaluations, but not the weighted importance of the attributes themselves, may also change. This is relevant to the current research as the systematic removal of options is often combined with these weighted evaluations in an effort to simplify decisions, minimize choice overload, and optimize choice outcomes (Kahn et al., 1987; Marcus & Schwartz, 2010; Schrift et al., 2011; Tversky & Sattath, 1979). This is intuitively reasonable as simplifying decisions by removing undesirable options could minimize negative choice effects, increase decision process ease, maximize positive outcomes, and result in increased satisfaction with the final choice.

We argue that the opposite is likely, and propose a choice-removal effect through which removing an option (or thinking about which option would be removed) instantaneously shifts or removes traditional choice motivations (e.g., value maximization, risk aversion, need for uniqueness), while not influencing attribute evaluations themselves.

We offer a series of studies examining these motivational shifts through observed differences in individuals' choice selections, and demonstrate a robust choice-removal effect that often leads to sub-optimal decisions. In study 1 we consider shifts in value maximizing motivations by asking participants to select an option from a choice set containing different gambles. In study 2 we consider shifts in another established choice motivation, namely need for uniqueness (Tian, Bearden, & Hunter, 2001). Studies 1 and 2 therefore provide a proof of concept for this choice-removal effect across two different choice based scenarios, and offer evidence that this process indeed removes or shifts choices away from traditional motivations. It also appears to be an instantaneous effect, as the removal of an option was immediately followed by a final choice. Study 2 also demonstrates that choice-removal is a mental process (potentially involving framing), as simply thinking about which choice they would remove led individuals to make choices similar to those who actually removed an option.

In studies 3, 4, and 5, we explore the internal processes associated with choice-removal before offering boundary conditions in which removing options does not influence final choices. Studies 3 and 4 demonstrate that the choice-removal effect is an internal process specifically centered on the *removal* of an option by the individual. Specifically, the choice-removal effect does not occur when the option is "randomly" removed for the individual (study 3). The effect also does not occur when the individual selects options from the initial choice set to keep (vs. selecting options to remove) (study 4). These studies also demonstrate that results cannot be explained by a choice set reduction, as individuals who had a choice removed for them and those who selected options to keep made final choice decisions in-line with those who did not minimize the choice set. In study 5 we consider the effect of the initial choice set size, and demonstrate that the choice-removal effect abates as the choice set size increases. Specifically, while we replicate the choice-removal effect with an initial choice set of three or four options, the effect does not exist when the initial choice consists of five, seven, nine, or eleven options.

Collectively, we introduce and repeatedly demonstrate a choice-removal effect in which the removal of an option from an initial choice set influences the ultimate choice selected. This effect appears to shift or remove traditional choice-based motivations (e.g., risk aversion, value maximization, need for uniqueness), and encourages sub-optimal decisions and evaluations. Interestingly, the choice-removal effect occurs when the choice set is minimized by removing (or thinks about removing) an undesirable option, but not when desirable options are kept, or when an option is removed by an outside source (e.g., "random" removal). The effect also appears to subsides as the initial choice set increases, though this result requires further consideration. Finally, removing an option before making a final choice appears to have little impact on decision process ease, though we observed more instances in which choice removal increased difficulty in making a final decision.

While continued examinations are warranted, we believe that implications for consumers and consumer welfare are many. The most important of which is to evaluate entire choice sets when making decisions. If, however, consumers decide to engage in choice-removal, they should avoid mental remove, as mental removal of an option results in lower levels of satisfaction with the final choice.

Manuscript

Consumers are often presented with consideration sets in which they are required to simultaneously compare multiple options before making a choice (Hsee et al., 1999). In response, consumers make comparative judgments of individual option attributes against an average of all option attributes in a series of weighted evaluations (Bhargava, Kim, & Srivastava, 2000). Furthermore, extant research has indicated that as choice sets vary, these averaged attribute evaluations, but not the weighted importance of the attributes themselves, may also change. This is relevant to the current research as the systematic removal of options is often combined with these weighted evaluations in an effort to simplify decisions, minimize choice overload, and optimize choice outcomes (Kahn et al., 1987; Marcus & Schwartz, 2010; Schrift et al., 2011; Tversky & Sattath, 1979). This is intuitively reasonable as simplifying decisions by removing undesirable options could minimize negative choice effects, increase decision process ease, maximize positive outcomes, and result in increased satisfaction with the final choice.

We argue that the opposite is likely, and propose a choice-removal effect through which removing an option (or thinking about which option would be removed) instantaneously shifts or removes traditional choice motivations (e.g., value maximization, risk aversion, need for uniqueness), while not influencing attribute evaluations themselves.

We offer a series of studies examining these motivational shifts through observed differences in individuals' choice selections, and demonstrate a robust choice-removal effect that often leads to sub-optimal decisions. In study 1 we considered shifts in value maximizing motivations by asking participants to select an option from a choice set containing different gambles. In study 2 we consider shifts

in another established choice motivation, namely need for uniqueness (Tian, Bearden, & Hunter, 2001). And, along with studies 3, 4, and 5, we explore the internal processes associated with choice-removal before offering boundary conditions in which removing options does or does not influence final choices.

All studies were conducted using online panels (e.g., Prolific, Mechanical Turk). Participants in studies 1a, 1b, 1c, and 1d were asked to choose between gambles that varied in probability of winning and payout amounts. Study 1a was a $100 gamble [73% chance of winning $146], [42% chance of winning $254], [11% chance of winning $969], all with the same expected payout of $106. Study 1b was a $5 gamble [75% chance of winning $15], [25% chance of winning $40], [25% chance of winning $35] with balanced expected payouts of $11.25, $10.00, and $8.75, respectively. Study 1c was a $5 gamble [78% chance of winning $12], [28% chance of winning $33], [23% chance of winning $30] with unbalanced expected payouts of $9.36, $9.24, and $6.90, respectively. Study 1d was a larger $100 gamble [78% chance of winning $197], [28% chance of winning $516], [23% chance of winning $507] with expected payouts of $153.66, $144.48, and $116.61, respectively. In the control condition respondents were asked to make a choice between the three alternatives. In the removal condition respondents were asked to make a choice between the same set of alternatives, but to eliminate a gamble before making a final choice between the remaining two options. The option order was randomized to avoid any order effects.

Chi-square analyses demonstrated that participants in the control conditions optimized their choice by selecting the least risky option with the highest expected payout. Participants in the removal condition were most likely to identify and remove the least optimal option, but were on average twice as likely to select a more risky choice with a smaller expected payout (study 1a: $\chi^2 (2) = 6.94$, $p < .05$; study 1b: $\chi^2 (2) = 33.99$, $p < .001$; study 1c: $\chi^2 (2) = 20.09$, $p < .001$; study 1d: $\chi^2 (2) = 5.73$, $p = .05$), see table 1. In addition, participants reported removing an option made the decision process more easy in study 1a ($F(1,312) = 6.52$, $p < .05$), more difficult in study 1b ($F(1,313) = 4.05$, $p < .05$), and no difference in decision process ease in studies 1c or 1d ($ps > .25$).

In studies 2a and 2b participants from an online panel were asked to imagine they were shopping for an apartment. The choice set consisted of three options and each apartment included a list of features. The features of one apartment were unique relative to the other two options. The other two apartments included identical lists of features, but the features were listed in different orders. In study 2b the description of the unique option from study 2a became the identical option, while the description of the identical option from study 2a became the description of the unique option in study 2b. This was done to control for potential apartment preference effects.

The removal conditions described in study 1 were used in study 2, but a third condition was added in which participants were asked to mentally remove (i.e., think about which option they would remove) an apartment from the choice set before selecting from the complete set of three options. Measures of respondents' attitudes toward their final selection were also included and the option order was again randomized to avoid any order effects. We expected that a need for uniqueness would drive individuals in the control condition to select the house with unique features (Simonson & Nowlis, 2000). For those in the removal conditions, however, we expected that actual or mental removal of a house from consideration would also remove need for uniqueness as a motivator of choice.

Results of study 2a and 2b demonstrated that actual or mental removal of an option made participants more likely to shift their choice from the unique option to the similar options (study 3a: $\chi^2 (4)$ = 169.01, $p < .001$; study 3b: $\chi^2 (4) = 22.46$, $p < .001$), see table 3. Moreover, mentally removing an option that was still available when making the final choice resulted in less favorable evaluations (study 3a: $M = 4.69$; study 3b: $M = 5.78$) than either not removing an option (study 2a: $M = 5.29$; study 2b: $M = 6.04$) or actually removing an option (study 2a: $M = 5.18$, $F(2, 665) = 10.38$, $p < .001$; study 2b: $M = 6.04$, $F(2, 665) = 5.08$, $p < .01$). There was no difference in participants' reported decision process ease (study 2a: $p > .90$; study 2b: $p > .50$).

Studies 1 and 2 therefore provide a proof of concept for this choice-removal effect across two different choice based scenarios, and offers evidence that this process removes or shifts choices away from traditional motivations. It also appears to be an instantaneous effect, as the removal of an option was immediately followed by a final choice. Finally, study 2 demonstrates that choice-removal is a mental process (potentially involving framing), as simply thinking about which choice they would remove led individuals to make choices similar to those who actually removed an option.

Participants in studies 3a and 3b were members of an online panel asked to make a choice using the same gamble choice set described in study 1d, a $100 gamble [78% chance of winning $197], [28% chance of winning $516], [23% chance of winning $507] with expected payouts of $153.66, $144.48, and $116.61, respectively. The two choice conditions described in study 1 were used in study 3, but a third condition was added in which the participants were told that prior to their choice, one option would be "randomly" removed. In study 3a the "randomly" removed gamble was the 23% chance of winning $507 with and expected payout of $116.61. This gamble was demonstrated to be the least desirable option in study 1d, and "randomly" removing it for the participants allowed us to consider the degree to which the removal process played a role in final choices. In study 3b the removed gamble was the gamble with a 78% chance of winning $197 with and expected payout of $153.66. This gamble was demonstrated to be the most desirable option in study 1d.

Results again demonstrated a choice-removal effect (study 3a: $\chi^2 (4) = 25.74$, $p < .001$; study 3b: $\chi^2 (4) = 166.87$, $p < .001$), see table 2. Results also replicated those found in study 1 such that individuals who removed an option prior to making their selection were more likely to ultimately choose a more risky gamble than participants who did not remove an option (study 3a: $\chi^2 (2) = 18.05$, $p < .001$; study 3b: $\chi^2 (2) = 20.17$, $p < .001$). In study 3a, however, individuals who had the least appealing option removed for them were just as likely to select the least risky option as those who did not remove an option before making a choice ($\chi^2 (2) = 3.47$, $p = .18$). Removing an option had no effect on decision process ease in study 3a ($p > .23$), but a significant effect on decision process ease existed in study 3b such that individuals who removed an option prior to making a final choice reported making a final choice was more difficult ($M = 5.21$) than individuals who did not remove an option prior to making a choice ($M = 5.55$) or had the most desirable option removed for them ($M = 5.76$; $F(2, 305) = 3.91$, $p < .05$). A significant effect of condition on attitudes toward the chosen option was also observed (study 3a: $F(2, 311) = 6.03$, $p < .01$; study 3b: $F(2, 305) = 26.93$, $p < .001$). Linear contrasts in study 3a indicated that individuals who had the least favorable option removed for them evaluated their chosen bet more favorably ($M = 5.67$) than individuals who removed an option before making a final choice ($M = 5.38$) and individuals who did not have an option removed before making a choice ($M = 5.03$; $F(1, 311) = 12.01$, $p < .001$). Linear contrasts in study 3b indicated that individuals who had the most favorable option removed for them evaluated their chosen bet less favorably ($M = 4.29$) than individuals who

removed an option before making a final choice ($M = 5.39$), while individuals who did not have an option removed before making a choice reported the most favorable attitudes toward their choice ($M = 5.74$; $F(1, 305) = 49.16$, $p < .001$).

Participants in study 4 were exposed to the same apartment choice set described in study 2, but we replaced the mental removal condition with a third condition in which we asked participants to select two options they would like to choose from (keep condition) as part of their final choice set. In doing this, we were able to 1) manipulate participants' motivation by either focusing on the best choice (keeping desirable options) or the worst choice (removing undesirable options), and 2) further isolate the removal process from any possible choice effects derived from having a smaller final choice set. Results offered further support for the choice removal effect ($\chi^2(4) = 11.64$, $p < .05$), see table 4, and demonstrated a significant difference in choice between those in the removal condition, and those in the keep condition ($\chi^2(2) = 7.97$, $p < .05$). Importantly, there was no difference in choice between the control condition and the keep condition ($\chi^2(2) = .17$, $p = .92$). There were also no differences in attitudes toward the final choice ($p = .83$) or in difficulty making the decision ($p = .17$).

Collectively, Studies 3 and 4 demonstrate that the choice-removal effect is an internal process centered on the removal of an option. These studies also demonstrate that results cannot be explained by a choice set reduction, as individuals who had a choice removed for them and those who selected two options to keep made final choice decisions in-line with those who did not minimize the choice set.

In study 5 we used the gamble scenario presented in study 1 to consider the effect of choice set size. Specifically, study 5a included three options, study 5b included four options, and studies 5c, 5d, 5e, and 5f included 5, 7, 9, and 11 option choice sets, respectively. Results indicated that the choice-removal effect existed for the three and four option choice sets (study 5a: $\chi^2(2) = 12.57$, $p < .01$; study 5b: $\chi^2(2) = 19.20$, $p < .001$). The effect was not demonstrated in the larger choice sets (all $ps > .05$), however, suggesting that the choice-removal effect is also a function of the size of the choice set.

Across these five studies we introduce and repeatedly demonstrate a choice-removal effect in which the removal of a choice from a larger choice set influences the final choice made. This effect appears to shift or remove traditional choice-based motivations (e.g., risk aversion, value maximization, need for uniqueness), and encourages sub-optimal decisions and evaluations. Interestingly, the choice-removal effect occurs when the choice set is minimized by removing (or thinks about removing) an undesirable option, but not when desirable options are kept, or when an option is removed for them. The effect also appears to abate as the initial choice set increases, though this result requires more consideration. Finally, removing an option before making a final choice appears to have little impact on decision process ease, though we observed more instances in which choice removal increased difficulty in making a final decision.

While continued examinations are warranted, we believe that implications for consumers and consumer welfare are many. The most important of which is to evaluate entire choice sets when making decisions. If, however, consumers decide to engage in choice-removal, they should avoid mental remove, as mental removal of an option results in lower levels of satisfaction with the final choice.

Can't Catch a Break: When Working During Time Off Undermines Intrinsic Motivation

Laura M. Giurge, London Business School, UK
Kaitlin Woolley, Cornell University, USA

EXTENDED ABSTRACT

Goal pursuit has fundamentally changed. In previous decades, the five-day work week provided consumers a standard for when to pursue professional versus personal goals, with benefits for well-being (Young and Melin 2019). Today, 30% of full-time employees are working weekends and holidays (American Time Use Survey, 2018). How do perceptions of when consumers pursue professional goals affect how interesting and meaningful those goal pursuits are (i.e. intrinsic motivation)?

Research on self-perception (Bem 1967; de Charms 1968) and busyness (Hsee, Yang, and Wang 2010) would suggest that professional goal pursuit during non-standard work time (weekends and holidays) increases intrinsic motivation by leading people to infer that their goal pursuits are meaningful or that they are busy and productive.

However, we predict that working during non-standard work time *reduces* intrinsic motivation. Our prediction is grounded in work showing that consumers rely on socially constructed time-use norms to make sense of time (Feldman, Reid, and Mazmanian 2019; Aeon, Giurge, and Whillans 2020). People label Monday as the "true" start of the week (Davydenko and Peetz 2019) and are more motivated to achieve their goals on the first day of the week (Dai, Milkman, and Riis, 2014). Deviations from these norms can lead to discomfort and suboptimal behavior. Starting a work task at a non-standard (4:07pm) versus standard time (4:00pm) undermines work performance (Labianca, Moon, and Watt 2005) and tightly scheduled intervals of time lead consumers to engage in easier and less extensive tasks (Tonietto, Malkoc, and Nowlis, 2018). Thus, engaging in professional goal pursuits during non-standard work time could create goal conflict, reducing intrinsic motivation.

As an initial test of our prediction, we examined full-time employees responding to the 2002 National Study of the Changing Workforce (NSCW) survey (n = 1,298, M_{age} = 41.80, SD = 11.25; 48.2% female). We categorized "non-standard work-time" as working some weekend days, and "standard work-time" as working only Monday-Friday. Intrinsic motivation included items that emphasized work as providing meaning, developing skills, feeling good about oneself, and task autonomy (α = .72; Grant 2008; Woolley and Fishbach 2018). We found that working non-standard (vs. standard) work time decreased intrinsic motivation (B = -.22, t(296) = -5.31, p < .001), even when controlling for other factors such as, life satisfaction, income, and work hours.

To provide a causal test of this effect, we conducted a pre-registered experiment. We randomly assigned 123 US students studying on campus during a federal holiday (65% female, M_{age} = 20.68, SD = 2.14) to one of two conditions. In the standard work time condition, participants read: "Today is February 17th." In the non-standard work time condition, participants read: "Today is February 17th, President's Day. Presidents' Day is a state holiday celebrated on the 3rd Monday of February when many people have off from work." Intrinsic motivation captured how much students found their materials to be interesting, enjoyable, engaging, and fun (α = .86; McAuley, Duncan, and Tammen, 1989). Participants in the non-standard work time condition reported lower intrinsic motivation (M = 3.70) than those in the standard work time condition (M = 4.31; t(121) = -2.80, p = .006, d = -.50).

In Study 3 we used a within-subject design, surveying the same people working during non-standard (Sunday) and standard (Tuesday) work time. A total of 271 participants completed both surveys (43.2% female, M_{age} = 40.31, SD = 13.04). Aside from intrinsic motivation (α_{Sunday} = .85; $\alpha_{Tuesday}$ = .89), we also assessed our mechanism by capturing how much conflict participants felt between wanting to pursue their professional versus their personal goals. Participants reported lower intrinsic motivation on Sunday (M = 4.71) than on Tuesday (M = 4.86; t(270)= -2.17, p = .031, d = -.13), and experienced greater goal conflict (M_{Sunday} = 3.27; $M_{Tuesday}$ = 3.03; t(270) = 2.14, p = .034, d = .13). The indirect path via goal conflict was significant (B = .02, 95% CI = [.002, .06]), with no significant direct effect (95% CI = [-.02, .26]) nor mediation in the opposite direction (95% CI = [-.07, .00]). Thus, working on a Sunday (vs. Tuesday) undermined intrinsic motivation via greater goal conflict.

Studies 4a-4b tested an intervention designed to attenuate goal conflict by modifying perceived time-use norms. In both studies, we reminded all participants that they were working during non-standard work time and randomly assigned them to two conditions (baseline vs. intervention). The intervention instructed participants to reframe non-standard work time as time to catch up/get ahead with work.

In Study 4a, we recruited 71 undergraduate and graduate students working at a campus library during the university's spring break holiday (64.8% female, M_{age} = 22.94, SD = 7.06). The intervention increased intrinsic motivation, ($M_{intervention}$ = 4.89; $M_{baseline}$ = 4.06; t(69) = 2.37, p = .021, d = .56).

In Study 4b, we recruited 180 participants on MTurk on a Saturday (64.8% female, M_{age} = 22.94, SD = 7.06). We included a behavioral measure to examine a real consequence of the effect of time-use on intrinsic motivation: whether people choose to complete a higher paying "work task" or a lower paying "fun task." The intervention increased intrinsic motivation ($M_{intervention}$ = 4.81; $M_{baseline}$ = 4.25; t(179) = 2.53, p = .012, d = .38) and the likelihood to choose a work task (intervention: 34.4% vs. baseline: 16.5%), χ^2(1, 181) = 7.70, p = .006, ϕ = -.21.

This research is the first to suggest that beyond what your professional goals are, when you pursue these goals determines intrinsic motivation. The implications of this research are meaningful: the removal of temporal boundaries around goal pursuit has implications not only for well-being, but also for motivation.

(Not) Giving the Same old Song and Dance: Gift-Givers' Aversion to Repeating Gifts

Julian Givi, West Virginia University, USA

EXTENDED ABSTRACT

Oftentimes when a gift-giver is selecting a gift, the recipient is someone whom the giver has given a gift to previously. The present research examines how givers' decision-making and recipients' desires are influenced by gifts given from giver to recipient on prior occasions; specifically, this research examines whether givers and recipients agree when it comes to the decision of whether to repeat a gift that the giver previously gave to the recipient (but is the best match with the recipient's preferences; i.e., a 'repeat' gift) or opt for some alternative gift that the giver is yet to give to the recipient (but is a poorer match with the recipient's preferences; i.e., a 'novel' gift). Study 1 examined whether givers and recipients agree when it comes to the repeat versus novel gift decision. Givers first read a scenario in which they were selecting a winter holiday gift for a friend and chose whether they would give him/her a $25 gift card to Starbucks, Subway, AMC, or Best Buy. Next, they read another scenario in which some time later they were selecting a birthday gift for their friend and again chose among the same four gift cards. Recipients completed the study in a similar manner, only from the recipient's perspective (i.e., they chose which gifts they would prefer to receive). (Note that with this type of design, it is clear the repeat gift is perceived as the best match with the recipient's preferences, since participants chose it over the other gifts initially.) Givers gave the repeat gift less often for the second occasion than recipients preferred (30% vs. 62%; $p < .001$).

Study 2 tested whether givers view the act of giving a repeat gift to be less thoughtful and more boring than do recipients, which could potentially lead to the gift choice asymmetry. The study was liked study 1, except: 1) Only wine-drinkers were eligible to participate, given the nature of the gifts; 2) Participants thought specifically of a friend *who drank wine*; 3) The first gift was given as a housewarming gift, and the second as a birthday gift a few months later; 4) The gifts were $25 bottles of Riesling, Viognier, and Sauvignon Blanc; and 5) Prior to making their second choice, participants indicated how thoughtful and how boring it would be of the giver to give the same gift that s/he gave previously (1 = Not at all, 7 = Very). Givers gave the repeat gift less often than recipients preferred (27% vs. 57%; $p < .001$). Additionally, givers considered the act of giving the repeat gift to be less thoughtful (M's = 3.38 vs. 4.91; $p < .001$) and more boring (M's = 4.78 vs. 3.49; $p < .001$) than did recipients. Bootstrapped mediation (Hayes 2013) revealed that these discrepancies mediated the gift choice asymmetry.

Study 3 again examined whether givers' aversion to repeat gifts stems from concerns about thoughtfulness and boringness. One implication of these hypotheses is that, when consumers are choosing multiple products for someone else in a non-gift-giving (vs. gift-giving) context, and thus are presumably less concerned with thoughtfulness and boringness, they should be more likely to choose a repeat option. Thus, in study 3, some participants ('choosers') made multiple decisions for a friend in a non-gift-giving context, while others ('givers') made the same decisions in a gift-giving context. Specifically, givers began the study in a similar manner as givers in study 1, except: 1) The gifts were $25 gift cards to Chipotle, Uber, and Starbucks; and 2) The first gift was given as a housewarming gift, and the second as a birthday gift a few months later. Choosers began the study in a similar manner except that their choices were not made in a gift-giving context. Specifically, they imagined that they and their friend completed two sets of surveys (separated by a

few months), and that after each set, the survey center allowed them to choose one of the gift cards for their friend to receive as part of his/her compensation. Participants in both conditions then indicated the extent to which they were concerned that choosing the same gift card twice i) would not be thoughtful, and ii) would be boring (1 = Not at all, 7 = Very). Givers selected the repeat gift card less often compared to choosers (42% vs. 61%; $p = .002$). Additionally, givers were more concerned that choosing the same gift card twice would not be thoughtful (M's = 4.11 vs. 2.81; $p < .001$) and would be boring (M's = 4.26 vs. 2.83; $p < .001$). Bootstrapped mediation (Hayes 2013) revealed that these discrepancies mediated the asymmetry in the percentage of participants choosing the repeat gift card.

The previous studies suggest that givers lost focus on a motivation to select the gift that best matched preferences because they became too focused on thoughtfulness and boringness. This means that, if givers can re-gain focus on a preference-matching motive, they should be more likely to give repeat gifts (i.e., make better choices). One way givers may be able re-gain such a focus is by first *predicting* the recipient's preference (Baskin et al. 2014). To that end, in study 4, some givers ('preference predicting givers') indicated which gift the recipient would prefer before they made their choice, while others ('control givers') did not. Specifically, control givers completed the study in the same manner as givers in study 3, except that they chose between only two of the gift cards (Chipotle and Starbucks). Preference predicting givers completed the study in a similar manner, except that, prior to making their second choice, they indicated which gift card they believed their friend would choose if s/he was purchasing one for him/herself. Givers who first predicted preferences gave the repeat gift more often than givers who chose without predicting preferences (76% vs. 60%; $p = .017$).

This research adds to the gift-giving literature by demonstrating a novel giver-recipient gift choice asymmetry (in which givers *knowingly* give non-preference-matching gifts) and documenting the mechanisms behind it.

What Makes Consumer–Brand Relationships Bad? Enlightening Relational Negativity

Maja Golf-Papez, University of Sussex, UK
Michael Beverland, University of Sussex, UK

EXTENDED ABSTRACT

In the past two decades, a considerable amount of research has been published on the relationships formed between consumers and brands. These studies mostly consider the bright side of brand relationships, with scholars idealizing the marital brand relationship style or any type of strong, easily strengthened or positive relationship (Fournier 2009; Fournier and Alvarez 2013). This focus on positive relationships seems somewhat divorced from reality, since consumer–brand relationships can be "troublesome, irking, unpleasant, aggravating, difficult, and problematic" (Spitzberg and Cupach 2007, 8). In fact, such negative brand relationships are more prevalent (Fournier and Alvarez 2013) and more salient (Baumeister et al. 2001) than positive ones.

Although there has been far less research on negative brand relationships than on positive ones, a growing body of literature analyzes the dark side of consumer–brand relationships. Studies have sought to examine, for instance, brand hate (Zarantonello et al. 2016), unliked strong brands (Veloutsou, Chatzipanagiotou, and Christodoulides 2020), and strong relationships that have been transgressed (Aaker, Fournier, and Brasel 2004). In addition, negatively valenced relationships are included in the recent customer–brand relationships model (see Park, Eisingerich, and Park 2013) and consumer–smart object interactions model (Novak and Hoffman 2019). Notwithstanding the insightfulness of all these studies, very little is known about how the diverse forms of consumer–brand relationship (strong or weak, and positive, negative, or neutral) actually become negative.

To answer the calls for "a science of negative relationships concerning the negative outcomes, processes, states, and attributes of consumers' relationships with brands" (Fournier and Alvarez 2013, 253) and for an overarching theory that will explain what "causes changes in relationships" (MacInnis and Folkes 2017, 366), we explore the phenomenon of *relational negativity*. We use the term 'relational negativity' to refer to the negativity (negative attitudes) that arises within or because of consumer–brand relationships. Our specific research questions are: (1) How does relational negativity come about? In other words, what makes relationships, however temporarily, bad? and (2) What does the negativity lead to?

To understand the negative aspects of brand relationships, we conducted image-elicitation in-depth interviews with 25 participants. Prior to and during the interviews, participants were asked to find pictures that represented their feelings and thoughts about three negative personal brand experiences. In total, we discussed 103 pictures and 75 brand experiences. Using Fiske's (1992) relational models as our analytical lens, we performed iterative interpretive analyses, focusing particularly on the actions, perceptions, and conditions that caused the negativity within the particular type of relationship and the outcomes of this negativity. To ensure the credibility of our findings, we used data and within-method triangulation and member checks.

Our analyses revealed the usefulness of understanding the interactions between consumers and brands in terms of four of Fiske's (1992) discrete relational models (i.e. communal sharing, authority ranking, equality matching, and market pricing). Interactions governed by the communal-sharing model were based on strong consumer identification with a brand. Reminiscent of Aggarwal's (2004) and Miller, Fournier, and Allen's (2012) communal relationships, communal-sharing relationships include relationships in which a consumer genuinely supports and cares about the brand. Authority-ranking relations were characterized by the consumer's perception of being subordinated to or dependent on the brand. Equality-matching relations included balanced, reciprocal exchanges between a consumer and a brand. Finally, in the brand market-pricing relations, roughly corresponding to Aggarwal's (2004) and Miller, Fournier, and Allen's (2012) exchange relationships, a consumer thought about a brand mainly in terms of its value for money.

In general, our informants related to each brand in terms of one predominant model. The negativity that arose in the brand relationships could be explained by: (1) the brand directly violating the rules and expectations of the enacted relational model (i.e., *within-model negativity*), (2) the brand enacting a different relational model than the consumer and therefore, indirectly violating the relational rules (i.e., *between-model negativity*), and (3) the negative aspects of being in a particular type of brand relationship (i.e., *by-model negativity*). These three different types of relational negativity influenced the consumer's decision to maintain or terminate the current relationship and whether to start using a competing brand.

This research contributes to our understanding of negative brand relationships. We demonstrate the fluidity and multidimensionality of relational negativity by illustrating how some consumer–brand relationships have never been positive, how some consumer–brand relationships become negative, and how some seemingly negative consumer–brand relationships are, in fact, positive. The presented framework with the four consumer–brand relationship types and the governing rules may give marketing and brand managers an alternative understanding of how consumers relate to their brands and what the brand's 'must dos' and 'shouldn't dos' are if they want to keep or fire the customer, respectively.

Helping Those that Hide: The Effect of Anticipated Stigmatization on Concealment and Debt Reduction

Miranda R. Goode, Ivey Business School, Canada

EXTENDED ABSTRACT

Credit use is widespread, but there is a point where *normal* use turns into an unmanageable burden, and marginalization is experienced (Bernthal, Crockett, and Rose 2005; Peñaloza & Barnhart 2011). These findings, combined with the emotional experience of debt (e.g., shame and embarrassment; Hayes 2000; Thorne and Anderson 2006), suggest that stigma may be a relevant lens to investigate debt accumulation and reduction, which is the focus of our investigation.

Stigmatization is the devaluation of an individual who is believed to possess a stigma and may be experienced as negative evaluations and emotional reactions, exclusion, teasing, loss of status and opportunities, undesirable labelling, and/or discrimination (Crocker, Major, and Steele 1998; Crockett 2017; Hing and Russell 2017; Major and O'Brien 2005; Quinn and Chaudoir 2009). In addition to *experiencing* stigmatization, individuals may *anticipate* stigmatization (Angermeyer et al. 2004; Hing and Russell 2017), which we define as the stigmatization one expects if precarious personal finances are divulged. Anticipating stigmatization can be as devastating as experiencing stigmatization and is associated with depression and anxiety; decreases in self-esteem and satisfaction; and avoidance of social relationships and support (Hing and Russell 2017; Markowitz 1998; Quinn and Chaudoir 2009). Anticipated stigmatization in gambling, smoking, and substance abuse contexts has been linked to concealment behaviors (Link et al. 1997; Stuber, Galea, and Link 2009). Extending this research, we examine the relationship between anticipated stigmatization and concealment in a debt context. We predict that

Hypothesis 1: *There will be a positive relationship between anticipated stigmatization and concealment of debt.*

Concealment is problematic because of the potential long-term negative consequences (e.g., *withdrawal from social interactions*; Link et al. 1997) and, we propose, *accumulation of more debt*. Withdrawal may involve avoiding social situations or being dishonest during social interactions (Hayes 2000) to avoid disclosing one's debt and thus stigmatization. Concealment may also involve opting into social situations that require spending money to avoid divulging precarious finances, a type of concealment not yet investigated but possible given the accessibility of credit. For example, frequently dining out with friends may result in an indebted individual accumulating more debt but, at the same time, minimizes the potential of stigmatization because it is not necessary to explain why one is not dining out anymore.

Community-oriented behavior change is available for problematic alcohol consumption, gambling, overeating, and spending (e.g., Weight Watchers). Participating in behavior change communities can improve well-being by increasing positive emotions and belongingness (Gesell et al. 2016; Groh, Jason, and Keys 2008; Wang and Willis 2016). Thus, working toward debt reduction among individuals with similar experiences in a behavior change course should improve well-being. We expect well-being will be supported by new relation-

ships formed in the course and to be experienced, to a greater extent, by individuals who anticipate more (versus less) stigmatization. Underpinning this theorizing is the assumption that experiences of isolation are more common for individuals who anticipate greater stigmatization, which increases the potential benefit of new, supportive relationships. Indeed, prior findings suggest that people in support communities become positively involved with one another. Thus, we predict

Hypothesis 2: *For indebted individuals who anticipate more (vs. less) stigmatization, well-being will improve to a greater extent in a community-based (versus individual) behavior change course because of increases in new supportive relationships.*

We propose a similar hypothesis with actual debt reduction and outline a role for motivation.

Hypothesis 3: *Debt reduction will be greatest in a community-based (versus individual) behavior change course because of increases in new supportive relationships, which in turn enhance motivation.*

In study 1 (n = 66), we found that higher debt stress increased anticipated stigmatization, which, in turn, increased preference to conceal one's debt ($\beta_{indirect}$ = ,74 95% CI .23 to 1.33). In study 2, we manipulated anticipated stigmatization to examine how financially stressed individuals respond in a spending situation involving a valued peer group. Participants (n = 195) who experienced a manipulation designed to increase anticipated stigmatization (versus control condition) had greater intentions to spend when in direct contact with a peer (β = -1.04, SE = .45, χ^2 = 5.41, p = .02, Exp(B) = .35), which enabled them to keep their debt concealed.

In study 3, we also found that higher levels of anticipated stigmatization were associated with accepting a costly lunch invitation (a decision that would result in incurring more debt and similar to results observed in study 2; β = .38, CI: .11, .64). Interestingly, declining the invitation was associated with increased lying to justify the decision (β = .29, CI: .11, .47), presumably because participants were able to conceal (i.e., avoid disclosing their financial struggles) and thus stigmatization.

Altogether, studies 1, 2, and 3 support H1 and establish that anticipating stigmatization increases concealment through various strategies. In study 4, we collaborated with a financial education company to examine if a behavior change program could improve well-being and financial outcomes for middle class individuals seeking to reduce their debt and particularly for those anticipating stigmatization. Participants (n = 235) with an average consumer debt load of $32,600USD, not including mortgages, were randomly assigned to a control condition or to complete a five-month debt reduction course in a classroom with other participants (community condition) or alone (individual condition). In support of H2 and H3, individuals who anticipate a higher level of stigmatization benefited most from the community (vs. individual) condition, experiencing greater increases to their well-being through enhanced social support ($\beta_{indirect}$ =

.15, 95% CI = .01, .38) and in terms of debt reduction: paying down more debt due to enhanced social support and increased motivation ($\beta_{indirect}$ = 1.22, 95% CI = .13, 3.22). See table 1 for results in all studies.

Considering the importance of money-related decisions in our lives, we know little about the experiences of and helping individuals in debt, and particularly those fearing negative judgments by others. Our research increases understanding of anticipated stigmatization in a debt context and offers practial solutions for helping indebted individuals.
